Progress was also achieved in journalistic, publication, television, cultural, art, physical culture, public health, family planning, and environmental protection undertakings.

2. Views on the Arrangements for the 1986 Plan

The overall requirement in the development of Shanghai's national economy in 1986 is: While continuing control over the scope of investment in fixed assets and over the rapid increase in consumption funds, we must make great efforts to raise enterprises' economic results, quickly increase our ability to earn foreign exchange through exports, accelerate the establishment of lateral economic ties, make further efforts to balance the economic relations, readjust the enterprise structure, build more basic facilities, ensure an adequate supply to the market, continue to maintain sustained, stable, and harmonious economic development, and strive for further improvement of the people's livelihood.

In conformity with the aforesaid requirements; our city's major tasks in 1986 are: first, on the basis of readjustment of the enterprise structure and development of the tertiary industry, we must make great efforts to transform the traditional industries, develop new ones, and at the same time do well in digesting and assimilating imported technologies; second, we must make great efforts to raise economic results, reduce consumption, improve product quality, conserve funds, and increase revenues; third, we must make still more efforts to open our city to the outside world and other areas of our country, utilize more foreign capital, import technologies, and make huge efforts to export goods and increase our foreign exchange earnings, striving to achieve a greater increase in our exports than last year; fourth, while controlling the scope of investment in fixed assets, we must step up construction of basic urban facilities by improving the investment climate; fifth, we must accelerate the development of intellectual resources and train more qualified personnel by promoting scientific and technological progress; and sixth, we must ensure adequate supplies for the market and stabilize commodity prices in order to elevate the level of the people's material and cultural life.

The main objectives of the 1986 plan are as follows: The whole city's gross national product is targeted at 50 billion yuan, 7 percent more than last year. Of this, the tertiary industry is scheduled for a 12 percent increase over last year to account for around 27 percent of the gross national product. We must further increase economic results. On the basis of the increased labor productivity, the increased proportion of profits and taxes compared to industrial enterprise funds, and the improved quality of major products, we have set our 1986 revenue at 5 percent more than last year. Our planned export volume is U.S. $3,278 million; of this, our city's own export goods will amount to U.S. $2.9 billion, an increase of 816 percent over last year.

Preliminary arrangements for the various 1986 plans are as follows:

a. We will maintain a certain growth rate for industrial and agricultural production to increase economic results.

In industrial production, we have targeted our city's total industrial output value at 87.9 billion yuan, an increase of 6 percent over last year. Of this, the light industrial output value will increase 5.6 percent and the heavy industrial output value, 6.5 percent.

In managing industrial production, we must adhere to the principle of "quality first" and correctly handle the relations between quality and between speed and results. All enterprises must seriously implement the "Regulations on Responsibility for the Quality of Industrial Products" promulgated by the State Council, continue to maintain factorywide quality control, tighten their supervision over product quality, and enforce the system of spot-checking product quality.

In agricultural production, further adjustment of agricultural production will be made on the condition that the major nonstaple foods for the city and the ration grain for peasants must be supplied by Shanghai's sururban counties. Readjustment of the crop structure should be carried in such a way that grain production is stabilized, cotton production is adjusted, vegetable production is maintained, feed crop production is developed, and production of cash crops needed by the market is ensured in order to render a still better service to the city. At the same time, we must make state-run farms a greater success. The 1986 total agricultural output value is targeted to be 4.8 percent over last year.

b. Strictly control the scope of investment in fixed assets and step up construction of the city's basic facilities.

The state has assigned a quota for our city's investment in fixed assets, 4,816 million yuan, of which 2,158 million yuan is for capital construction and 2,658 million yuan for technical transformation. Adding the projects directly under central ministries, projects affiliated with central ministries, and projects of collectives, the city's total investment in fixed assets will be of the same level as in 1985.

Of the capital construction projects to receive investment this year, only 10 percent are new ones. The emphasis of technical transformation is placed on expansion of export products, importation of technologies, and construction of basic municipal facilities. Appropriate arrangements have also been made for such sectors as energy, transportation, finance and trade, agriculture and culture and education as well as the minor three fronts [xiao san xian 1420 0005 4848].

In strictly controlling the investment scale on fixed assets, it is necessary, first to ensure key projects and limit construction of new projects by supplying sufficient funds, materials, and manpower to the former, and by withholding construction of the latter, where funds, materials and other conditions are inadequate. Second, it is necessary to strictly follow the reviewing and approving procedures by ensuring that projects covered under budgetary investment are to be carried out according to the investment responsibility system and within the quota. The letter of planned tasks will not be issued to new projects that have not yet gone through technical and economic feasibility studies; design should not be worked out for projects without an approved letter of planned tasks; and those without an approved design document should be excluded from the fiscal plan. Third, it is necessary to continue to control loans for capital construction by listing those for state capital construction projects under the state credit plan and issuing funds strictly according to the plan. Funds especially raised by units themselves for new projects should only be used for that special purpose after a 6-month deposit period in the bank. Fourth, a contract for a project to import technology or utilize foreign funds can be signed only after supplementary funds and foreign exchange quotas for that project are set.

c. Pay close attention to export trade and properly arrange the domestic trade market.

In 1986 Shanghai's exports will total $2.9 billion, which requires an additional supply of 1 billion yuan in export commodities; and retail sales will total 20.2 billion yuan, 10.3 percent more than 1985, or a net increase of 1.88 billion yuan, which requires an additional supply of 1.5 billion yuan in manufactured goods. In order to ensure supply for domestic and foreign trade, it is necessary to increase industrial production and strive to close the gap between market needs and supply.

d. Further expand economic ties with foreign countries.

The quota set by the State Planning Commission for Shanghai to utilize foreign funds in 1986 is $214 million, in addition to 25 billion yen in bonds, equivalent to $130 million, to be issued by the Shanghai Investment and Trust Corporation. In order to absorb more foreign funds, enterprises capable of repaying funds and earning more foreign exchange through exports should be encouraged to use more foreign commercial loans. In utilizing foreign funds, it is necessary to make adequate prior preparations and conduct special study on the construction plan for major municipal infrastructural and cultural projects. For projects already approved as Sino-foreign joint ventures, for cooperative enterprises with Chinese-foreign partnerships, and for enterprises owned by foreign capital (hereafter called "three capital" enterprises for short) it is necessary to map out an investment plan on fixed assets; and for enterprises already in operation, it is necessary to conduct individual study to help them solve problems in production, operation, or management. The key to balancing the foreign exchange of the "three capital" enterprises is to accelerate the pace of domestic development of imported technology and, at the same time, balance our foreign exchange payment by increasing exports. Central and local governments will extend the necessary subsidy to a small number of "three capital" enterprises that are indeed facing temporary difficulty in balancing their foreign exchange payments.

e. Accelerate the development of scientific, technological, and cultural undertakings.

In science and technology it is necessary to actively develop microelectronics, biological, new materials, and optical fibre communication technologies, and pay due attention to intensifying the study of basic and applied sciences. We should work out projects to serve the needs of industrial technological transformation, the urban infrastructure, and environmental protection, as well as concentrate efforts on projects that can quickly transform technological achievements into export commodities, or can be substituted for imports to conserve foreign exchange. Attention should also be paid to render technical service to small- and medium-sized enterprises and rural industries.

In 1986, Shanghai plans to enroll 30,600 new students in regular schools of higher learning, including 12,900 in local universities; 5,000 new postgraduates, including 650 in local universities' graduate schools; and 24,300 students in secondary specialized schools. While conscientiously implementing the "Regulations on Popularizing Compulsory Education in Shanghai Municipality," we shall strengthen basic education, improve teaching conditions in primary and middle schools, stabilize and replenish the contingent of teachers, raise the quality of education, consolidate, readjust, and develop vocational and technical education, and provide better on-the-job training for the workers.

f. Improve the people's livelihood.

Along with economic advances, we shall improve market supply and keep commodity prices basically stable in order to continually raise the material and cultural living standards of urban and rural residents.

While striving to fulfill the above-listed targets, the municipal government will carry out 15 practical projects closely related to improvement of the people's livelihood.

3. Major Measures for Achieving the 1986 Plan

First, we should persist in restructuring the economic system.

To accomplish the 1986 Plan for National Economic and Social Development, we should, while implementing the guidelines set forth by the Fifth Shanghai Municipal Party Congress, continue to mobilize the people in Shanghai to expedite economic reform firmly, cautiously, and reliably. This year, we must continue to do a good job in consolidating, assimilating, replenishing and improving the various reform projects draw up our plans on the basis of conducting indepth investigation, and be fully prepared for making new steps of reform in 1987 and 1988.

The essential task in restructuring the national economy with the focus on the urban economy is to reinvigorate our enterprises, especially the large- and medium-size state-owned industrial enterprises. In 1986, we must continue to implement the instructions of the CPC Central Committee and the State Council about giving our enterprises greater decision-making power and reinvigorating the large- and medium-size state-owned industrial enterprises, and continue to take internal and external measures to create necessary conditions for this purpose. Commercial enterprises should continue to enliven commodity circulation by reforming and diversifying their operation, which includes opening more channels and eliminating nonessential work.

We should also take positive steps to promote lateral economic ties according to the requirements set for a planned commodity economy.

While continuing to enliven microeconomic activities, we must intensify and improve macroeconomic control. First of all, we should improve our planning. According to the requirement of reducing the scope of mandatory plans, we should gradually shift the focus of our work to carrying out indirect control with economic policies and economic means. Second, we should reinforce the departments which supervise auditing, commodity prices, statistics, measurements, standardization, and business administration, establish and improve economic supervisory organs, and intensify economic legislation and the enforcement of economic laws. Third, we should set up an economic information system so that we can improve our work in the area of making economic forecasts, and of collecting, distributing, sorting and analyzing economic information; and so that we can provide prompt service and guidance for making economic decisions.

Second, we should take positive measures to deal with shortages of energy and major raw and semifinished materials.

To solve the electricity issue, we should combine our short-term and long-term plans so that we can meet short-term needs and permanently deal with the problem. Presently we are negotiating with relevant departments for the purchase of extra fuel oil so as to generate more electricity to meet actual needs. Meanwhile, we must conserve power consumption, properly schedule power use, and accelerate the construction of the projected substations so that they can be completed and put into operation ahead of schedule.

To make up the shortage of major raw and semifinished materials, we must take positive and effective measures to broaden resources and conserve consumption. We should make every effort to secure the resources distributed by the state by doing a good job in placing orders for the goods, pressing for their delivery, and providing the needed transportation service. We should also impart part of the raw and semifinished materials by using our foreign exchange. We should also promote international cooperation projects, such as processing on order and compensatory trade, and take active measures to secure and increase the output of extra resources through all channels. We should continue to conserve the consumption of raw and semifinished materials, including electricity, by using alternatives, fully using our resources, reducing per-unit consumption in manufacturing goods and in construction, and introducing proper measures for encouraging the conservation of resources.

Third, we should make an effort to improve the extension of credit and credit management, and balance foreign exchange revenues and expenditures.

Under the circumstances that credit funds are strictly controlled throughout the country, the supply of credit funds will still be tight in Shanghai this year. In order that economic development will not be affected by availability of credit funds, we should, under the principle of handling each case on its merits and assisting the promising projects, give priority to extending credit funds needed for the production and procurement of goods that can bring in foreign exchange, and goods which are in high demand on the market, and for the procurement of agricultural and sideline products produced under government plan. No loans will be extended to those enterprises who economic performance is poor, whose products are unsellable, and which have a large inventory of unsold products. Loans that have already been extended to the enterprises should be withdrawn within a specific time.

According to the 1986 plan for foreign exchange revenues and expenditures, the amount of foreign exchange available to various bureaus will remain the same as that of 1985, but Shanghai's collective foreign exchange expenditure will be 20 percent lower than that of 1985.

Fourth, we must effectively improve business management.

The basic requirements for improving business management include: first, restructuring the enterprises' leadership system by giving their directors managing power; second, improving the system which safeguards the economic responsibility system as well as ideological and political work; third, simultaneously paying attention to technology and management so that the quality of products can be constantly improved, the consumption of resources can be conserved, and the enterprises will have a greater capacity for improvement and development.

Socialist material construction and socialist spiritual construction are interdependent, and they help each other progress. While promoting material construction, we must exert great efforts to promote spiritual construction.

The year 1986 is the first year for implementing the Seventh 5-Year Plan. The accomplishment of the projects set for 1986 is of great significance for carrying out the strategy for achieving economic growth in all sectors in Shanghai, and for promoting Shanghai's economic development. Under the party's leadership, let us unite as one, work with one heart and one soul, be determined to keep forging ahead, work conscientiously, and struggle for accomplishing all the projects set for 1986.

PROVINCIAL AFFAIRS

CURRENT STATUS OF ECONOMIC REFORM IN YUNNAN

Kunming YUNNAN RIBAO in Chinese 18, 25 Oct 85

[18 Oct 85 p 3]

[Text] I. Reform The Only Way Out

A frontier province, Yunnan is out of the way and culturally backward. Before the 3d Plenary Session of the 11th CPC Central Committee, we did a lot of work and obtained considerable achievements, but peasants in certain parts of the province still did not have enough to eat or wear. Economic growth was slow, with the agricultural sector in particularly deep distress. Some localities languished in a state of primitive agriculture, still practicing slash-and-burn cultivation, and had exceedingly low productive forces. For the province as a whole, what we had was basically a closed, small-scale peasant economy. We did not produce enough grains and oil and had to buy them in vast quantities from other provinces. Agriculture was a serious stumbling block to the economic growth of the province. With its outdated equipment, backward management, low technical standard, unskilled workers and dismal productivity, the province's industrial base was shaky. Year after year iron and steel production lost money. Raw coal output failed to go up as a result of a longstanding disequilibrium between reserves and excavation. Light and textile industries were hopelessly out of touch with public needs. They churned out old-fashioned, inferior but expensive products lacking in variety. Even these goods were not produced in sufficient quantities to meet demand, resulting in widespread commodity shortages. There were large numbers of people in towns and villages waiting for jobs. People lived in straitened circumstances. As was the case nationwide, the basic reason for this situation was the problems long plaguing the national economy: proportionate imbalances, mismatch between production and demand, low economic results, gross waste and losses. All this, in turn, was part and parcel of the serious shortcomings of our economic system. Our former economic management system was fraught with problems. For instance, in state-enterprise relations, there was over-centralization by the state and enterprises were controlled to death. Lacking the autonomy that was due them, they had little power in such areas as planning, production, materials, labor and finance. No distinction was made between well-run enterprises and those which were mismanaged. The profit of an enterprise also bore no relation to the worker's material interests. As a result, enterprises tended to be complacent and uncompetitive. As their supply, production and marketing had nothing to do with one another, in the same way that production was divorced from demand, enterprises failed to adapt to changes in the national economy, in people's livelihood and in the domestic and international marketplaces. Distribution was heavily influenced by egalitarianism. There was no clear-cut division of labor between departments and jurisdictional confusion was rampant. Administrative organizations were over-staffed, administrative levels overlapped one another and efficiency was low. On the whole, the economic management system was over-centralized and over-regulated. Financial power was centralized. There was a state monopoly over the purchase and sale of materials. Foreign trade was strictly controlled. The idea of "eating off the common rice pot" was widespread. There was no regard for economic results. Ideologically we denied the existence of a commodity economy under a socialist system of public ownership. By doing so, we in effect rejected the law of value. The result was that the prices of many commodities reflected neither value nor the supply-demand relations, distorting our evaluation of the management and economic results of enterprises and adversely affecting the development of commodity production and exchange. All this has stifled enterprises' and workers' initiative, enthusiasm and creativity. In short, then, our economic system followed a model incompatible with the development of social productive forces. We must put an end to this situation with determination. Without reform, we will not be able to perfect socialist production relations and the superstructure and better adapt them to the development of productive forces. Without reform, we will not be able to speed up the four modernizations. Without reform, we will not be able to achieve socialism with Chinese characteristics. In a word, without reform, we have no future. Reform is the inevitable historical trend. In 1978, the CPC Central Committee convened the 3d Plenary Session at an opportune moment where it laid down the Marxist guiding principle, "Liberate ideas, use our brains, seek truth from facts and unite as one as we face the future," and resolutely decided to shift the focus of our work toward economic construction. It defined our task as one of "adopting a series of new and major economic measures and conscientiously reforming the economic management system and management methods in accordance with the new historical conditions and practical experience." Soon afterwards it put forward a sound policy which calls on us to "rectify, reform, restructure and improve" the various sectors in the national economy. The "Resolution of the CPC Central Committee on Certain Historical Issues in the Party since the Founding of the PRC" also points out, "It will take a long process for a socialist system to move from imperfection to perfection. This requires that even while upholding the basic socialist system as a prerequisite, we must strive to reform specific systems unsuited to the development of productive forces and incompatible with the people's interests, and firmly struggle against all activities detrimental to socialism. As our enterprise develops, the overwhelming superiority of socialism will become more and more evident."

Guided by the series of policies, including "domestic economic invigoration and the open door policy," determined in succession by the CPC Central Committee, cities and villages in Yunnan have gradually taken the first steps toward restructuring the economic system. The joint production contracting responsibility system has been implemented in the vast countryside. In cities, experiments were carried out in the expansion of enterprise autonomy. With a few years' experience behind us, we now begin to understand anew a host of crucial issues. In particular we have clarified two concepts in both theory and practice. First, a planned socialist economy and commodity economy are not mutually exclusive. Socialism should also develop a commodity economy. Second, economic control should go hand in hand with the price mechanism. Economic planning can either be mandatory or serve as a guide. In October 1984 the 3d Plenary Session of the 12th Central Committee was convened which approved the "Resolution on Restructuring the Economic System." This resolution sets out some major decisions pertaining to various aspects of the restructuring of the economic system, including its significance, nature, direction, mission, principles, policies and methods. Systematically and profoundly it explains that the only way China can vitalize its national economy is to reform its existing economic management system. It presents to the whole party and to the entire people a blueprint for wholesale reform. The "resolution" breaks with outdated traditional ideas on some critical theoretical issues. It is a programmatic document that guides us as we restructure the economic system and build socialism with Chinese characteristics.

Recently Comrade Deng Xiaoping repeatedly emphasized, "If we do not go in for reform, if we do not adhere to the open door policy, we will not be able to accomplish the strategic goals of economic development which we have set for ourselves. We must pursue reform and the open door policy. We must not change our minds. If we do, we will be doomed. I believe our policy will succeed."

II. Reform And Its Results

In line with the spirit of the CPC Central Committee, our province, like the rest of the nation, has gradually introduced a series of reforms since the 3d Plenary Session of the 11th CPC Central Committee and obtained remarkable results.

Reform Begins in the Countryside and Gradually Spreads to the Cities

In the countryside we have carried out a number of policies to lessen the burden on peasants and give them a respite from their hardships. Procurement prices for agricultural and sideline products have been raised and the family joint production contracting responsibility system has gradually been put into effect. At the same time, the people's commune system has bee overhauled; several hundred million mu of collectively owned land in barren, wooded and grassy areas in the mountains were contracted out to households. The ownership and raising of large livestock is now privatized. Inside state-run farms, tree centers, pastures and fishing grounds, family farms were set up and various forms of production responsibility systems instituted. Peasants are encouraged to dig a pond and keep fish or put up an orchard on the land contracted out to them. The number of rural country fair trade points was increased and urban agricultural markets were started. Peasants were given guidance and encouraged to go into mining on their own or in conjunction with other households. They were encouraged to enter the cities and set up their own businesses. Special policies were adopted for impoverished areas and localities inhabited by minorities to speed up their economic and educational development. The abolition of the state monopoly over purchase and marketing, in particular, was warmly welcomed by the peasants.

In cities, we began reform by zeroing in on the managerial autonomy of enterprises. We first tackled state-run industrial and commercial enterprises and then gradually moved onto commercial circulation, finance and other economic areas. There have been 13 major reforms since early 1979.

(1) Actively experiment in enterprise autonomy expansion. At the beginning of the experiment, autonomy expansion essentially revolved around four aspects: first, expanding an enterprise's production planning power, ie., giving it the power to increase the output of popular products, to look for raw materials and to sell on their own products in excess of the planned target. Second, expanding its financial power. Specifically, an enterprise is now authorized to retain a portion of its profits in accordance with approved procedures and combine the three funds, namely, the depreciation, major repair and production development funds. Third, giving it a certain measure of power to reward and punish. In other words, the enterprise now has the power to use the reward fund in a reasonable manner and within approved limits. It can reward and promote workers with outstanding contributions and dismiss employees guilty of discipline violations or dereliction of duty. Fourth, giving it definite personnel autonomy. It is now empowered to determine its internal organizational setup and appoint and remove cadres at the middle level and below. Some enterprises also experimented with the election of workshop cadres and cadres at the factory level and implemented a system of work-related subsidies on a trial basis. After 1981, this experiment in enterprise autonomy expansion further developed into an economic responsibility system which combined responsibility and power with benefits. Last year, the State Council promulgated the "Provisional Regulations on Further Expanding the Autonomy of State-Run Enterprises" which gave large and medium-sized enterprises additional power and imposed an eight-tier progressive tax on small state-run industrial and commercial enterprises which can now be run like a collective enterprise under state ownership. Some may elect to switch to collective ownership while others are allowed to be rented out to collectives or individuals.

(2) In restructuring the financial system, we began with four preliminary reforms. First, as far as the financial relations between the province and the state are concerned, we eliminated the shortcomings of centralized state control on expenditures and income. Instead we took 1979 as a base and worked out subsidies for a period of 5 years during which they were to remain unchanged. The second reform had to do with the financial system of the various regions, prefectures and municipalities. Parallel with the relations between the province and the state, we implemented a system of subsidies with regard to the four border nationality autonomous prefectures, Diqing, Nujiang, Dehong and Xishuang Banna. As for the other 13 regions, prefectures and municipalities, expenditures and revenues are differentiated with the excess income to be retained by the localities or divided between them and the province. Organizations at the provincial level are to be responsible for their own administrative expenses. Any income in excess of expenses can be kept by the organizations for their own use. By a variety of mechanisms,

enterprises have been given greater autonomy in the use of their own funds. They are made accountable for their own profits and losses. Based on the State Council's overall plan, we took the first steps toward replacing profits with taxes early last year. The next step occurred in late 1984 when a tax system on enterprises was written into law. As a result, enterprises have greater control over the use of their after-tax profits. Fourth, we experimented with a compensatory use system of fixed capital and circulating capital, thereby increasing the efficiency with which capital is used.

(3) Wages and incentives. In 1978, we instituted in state-run enterprises a system under which bonuses were determined in accordance with a specified formula depending on the size of the overall payroll. This system applied when the enterprise had successfully fulfilled their state plan. In 1979, bonuses calculated in accordance with the enterprise's economic results were handed out in enterprises implementing pilot projects in autonomy expansion. In 1981, bonuses were made to fluctuate with the amount of profits turned over by an enterprise to the state. In this way a steady increase in state revenues was ensured, the principle of punishing laggard enterprises and rewarding good ones was realized and workers' enthusiasm for increasing output and hence income was mobilized. In 1983 we took yet another step forward by removing the ceiling on bonuses and taxing the excessive amount. Concerning the distribution of bonuses within enterprises, we introduced an array of methods, such as calculating bonuses in accordance with percentages, floating wages and piece rate wages, etc. This year we also demanded that enterprises relate their total payroll to their economic results as a way of reforming the wage system.

(4) Reforming the leadership system in an enterprise. The factory director responsibility system under the party committee has replaced the factory director division of responsibility system under the party committee. In 1982, the CPC Central Committee successively promulgated three sets of provisional regulations pertaining to the party committee in an enterprise, the factory director and workers' representative assembly respectively. The factory director began to assume overall responsibility for an enterprise's production and operational activities. One after another a majority of enterprises established workers' representative assemblies. A small number of enterprises also experimented with a factory director responsibility system under the leadership of the workers' representative assembly. Their experience paved the way for the implementation of the factory director responsibility system across the board this year.

(5) An open circulation system which consists of a multitude of channels but fewer links is being tried out. At the same time as some businesses and enterprises experimented with autonomy expansion, a large number of agricultural and sideline products were being removed from the grip of the state monopoly over purchase and marketing. Instead the purchase and marketing of industrial articles of daily use is now governed by seven methods. They may be purchased by the state. They may be purchased by the state in accordance with a plan. They may be purchased in accordance with fixed quotas. They may be freely selected and purchased. They may be bought and sold for the state on a commission basis. Industrial and commercial enterprises may come together for joint operations. Finally they may be sold

by the enterprise itself. The range of merchandise and scope of operations of retail businesses have also been broadened. Since last year the wholesale system has too been reformed with a reduction in the number of circulation links. In the future the state will rely mainly on state-run wholesale organizations to manage the market in accordance with a plan. At the same time, building on the existing two-grade stations, it will gradually establish a number of specialized trade centers, which, in turn, will lead to the establishment of comprehensive industrial product trading centers. The Kunming trade center plans to set up 12 commodity exchange markets. Supply and marketing cooperatives at the grassroots level have reverted to collective ownership from ownership by the whole people. Instead of being run by the government, they are now privately-run. In addition, supply and marketing cooperatives have been set up in border nationality areas formerly lacking such facilities.

(6) The co-existence of a multitude of economic forms and various operating methods. The state sector of the economy remains the dominant element, but more freedom is now given to the collective economy in the countryside and urban areas. The individual economy is also allowed to develop in an appropriate way. In the past few years we have liberalized our policy toward the collective economy. First, we have cut taxes and exempted some enterprises from taxation, going out of our way to help new enterprises and those set up to accommodate jobless youth. Second, we have raised the income tax exemption to 3,000 yuan. Third, we have either reduced or abolished contributions to the cooperation enterprise fund. Fourth, collective enterprises may use 10 to 15 percent of their after-tax profits as bonuses for distribution among their workers, provided no bonus exceeds a worker's 2-month wages. Policies on individual households were likewise liberalized. The provincial government has successively promulgated 10 regulations on the imposition of fees on individual industrial and commercial households. As a result, Yunnan's collective economy, particularly rural and township enterprises, has been able to make substantial progress. Urban and rural individual households and new economic joint organizations have mushroomed. As of mid-1985, there were 310,000 individual industrial and commercial households in Yunnan, consisting of 460,000 people.

(7) Reforms in the planning and management system. The planned economy still takes center stage, but it is now supplemented by market regulation. The scope of command planning is being narrowed gradually while a large number of products now fall under guidance planning. Articles of daily use, meanwhile, are to be regulated directly by the marketplace and their prices decontrolled. In this way the state maintains its grip on products which impinge on the national economy while the marketplace has been able to play its part. Since last year there has been an ongoing effort to "decontrol" prices, expand the scope of guidance planning and make better use of the marketplace as a regulator. An enterprise can market on its own its output in excess of the quota in the plan. The prices of industrial means of production marketed independently by an enterprise are allowed to fluctuate within set limits. This year price control on certain agricultural and sideline products was further relaxed. On 1 April, we even adjusted the rates for vehicular transportation, now to be calculated in accordance with the route traveled.

Banking reforms. We have increased interest rates on deposits several times, expanded credit services, begun trust services and experimented with investment in capital construction projects and technical modernization. From 1980 onwards, loans have been made on a trial basis to some sugar-manufacturing, light industry and textile enterprises which used to rely on state appropriations. For a fee they can now use the loans to make investments. In the process we solved the problem of insufficient state investments at a time when funds were desperately needed in some industries for development as well as increasing the efficiency with which funds were used. This reform has been instrumental in exploiting Yunnan's economic superiority in the cigarette and sugar industries.

(9) Reforms in labor and personnel systems, including the decentralization of cadre management power. Last June the provincial government approved and circulated a provisional regulation drawn up by the provincial Labor and Personnel Department on the implementation of a labor contract system and demanded that all state-run enterprises, institutions and organizations adopt the contract system when they hired people covered by their labor plans, except in cases where one or two people were hired. In August 1984, the provincial party committee approved and circulated 14 comments by its organization department pertaining to certain issues on the cadre management system and decentralized cadre management power. Henceforth the provincial committee will concern itself only with the major leading cadres in provincial-level departments, various prefectures and municipalities, institutions of higher education and large enterprises.

(10) Two reforms took place last year in the economic management system. First, the county (municipal) economic management power was further increased. The provincial party committee and the provincial government resolved that beginning in March this year, every county in Yunnan was to be responsible for finance, grains and major agricultural products. The planning and personnel management powers of counties were augmented. Second, provincial departments and bureaus would no longer run enterprises directly. In most cases, the management of provincial enterprises would be the responsibility of central cities. The purpose of this reform is to make better use of cities as economic centers and of provincial departments and bureaus as functional arms of the government. Furthermore, based on the principle of specialized cooperation, we have reformed the enterprise management system in the central cities on a trial basis and established specialized companies and joint enterprises.

(11) Since last year, we have made the reform of the construction industry a pacesetter for urban reform and introduced four changes. First, establishing a system under which a person is held responsible for a project. Second, adopting open bidding for design projects. The unit which undertakes to do a project will be governed by a responsibility system complete with penalties and rewards. Third, adopting open bidding for engineering projects to break the monopoly in the construction industry. Fourth, applying to all enterprises in the construction and installations business a responsibility system with no ceiling and no minimum.

(12) The old closed economic system has experienced some preliminary changes. As we continuously deepened our understanding of the importance of the open door policy, we have also effected a transition to an open system by strengthening cooperation with other provinces, consolidating horizontal economic ties with various regions within the province and concluded a large number of import contracts with other nations, Hong Kong and Macao. The provincial party committee has also decided to relax restrictions on small-scale border trade, allow adjustments in trade volume depending on the actual circumstances, and decentralize the power to examine and approve applications for entry and exit permits. The old restrictions that limited trade between border people to within an area of 20 kilometers and below 20 yuan were set aside. Approval was also given for the establishment of three border markets at Mengding in Gengma County, Fengweiba in Zhenkang County and Wangkaba in Cangyuan County.

(13) To implement the policy on intellectuals and improve salary and other conditions for scientific and technical personnel, Yunnan has reversed numerous unjust verdicts, cleared many people of fabricated charges and launched a job evaluation exercise. The province has reviewed and assessed the titles of 118,241 scientific and technical cadres of the rank of assistant engineer and above. In 1983, the provincial party committee and provincial government came up with 16 regulations to further improve the working, learning and living conditions of scientific and technical personnel and unleash their initiative.

Reform Produces A New Phenomenon of Sustained, Stable and Balanced Development In The Yunnan Economy

In recent years, the restructuring of the urban and rural economic systems in Yunnan has achieved striking results, powerfully mobilizing public enthusiasm for building socialism and setting free their production forces. The strategic breakthrough in rural reform, in particular, not only gave the rural economy a powerful push in the direction of commercialization, specialization, modernization, the comprehensive development of agriculture, animal husbandry, forestry and fishery, and the integrated development of agriculture, industry and transportation, but also effectively propelled the restructuring of the urban economic system and the entire national economy. Things are getting better each year.

The province's economic development situation in 1984 was the best ever since the 3d Plenary Session of the 11th CPC Central Committee. Total industrial output value, which was only 3.059 billion yuan (in 1970 constant prices) in 1976, burst through the 10 billion yuan barrier to reach 10.86 billion yuan, up 15.5 percent over 1983. This is a major achievement on the industrial front, the result of many years of struggle by vast numbers of cadres and workers. Total grain production exceeded 20 billion jin and hit 20.1 billion jin, a net increase of over 1 billion jin, another remarkable feat. For years the province's grain production stubbornly hovered around 15 billion jin. How eagerly did everybody look forward to food self-sufficiency. Today, although our per capita grain supply was only 600 jin, still a good distance from the national average of 800 jin, we have come a long way from the days when we often wondered where the next meal was going to come from. Government revenues reached 1.97 billion yuan, an increase of 14.9 percent over the year earlier, and a jump of close to 2.9-fold over the 1976 figure of 508.33 million yuan. Total industrial and agricultural output value of the province reached 18.3 billion yuan, for an average annual increase rate of 11.1 percent for the past 4 years. National income was 12.2 billion yuan, for an average annual increase rate of 11 percent. The value of social commodity retail sales stood at 7.37 billion yuan, for an average annual increase rate of 14 percent of the past 4 years. Total agricultural output value has been expanding at the average annual rate of 10.2 percent during the same period. Turning to industry, the output values of light industry and heavy industry have been growing at the average annual rates of 14.7 percent and 9.3 percent respectively. In other words, agriculture, light industry and heavy industry have been developing in a fairly coordinated way. In 1978 the overall labor productivity of industrial enterprises owned by the whole people was a mere 7,779 yuan. By 1984, however, it had soared to 11,849 yuan, no mean feat. Since the 3d Plenary Session of the 11th CPC Central Committee, the ratio between accumulation and consumption has achieved a degree of rationality. In 1978, the accumulation rate was 34.6 percent. After 1981, the accumulation rate has basically been contained at about 30 percent (29.4 percent in 1981, 29.8 percent in 1982, 28.9 percent in 1983 and 31.6 percent in 1984.) This kind of accumulation rate is in line with the province's realities. Yunnan's closed economic system has taken the first steps toward becoming an open system. Since the 3d Plenary Session of the 11th CPC Central Committee, Yunnan has successively concluded contracts and agreements with over 10 countries and regions. This year alone we have clinched deals worth $300 million. In addition, the province has launched 3,509 economic and technical cooperation projects with 19 provinces, autonomous regions and municipalities directly under the central government, which are expected to raise funds totalling 300 million yuan for the province. According to data from 32 enterprises which have carried out such projects, their annual profits have increased by almost 30 million yuan. In Chuxiong Prefecture, nine enterprises receiving aid doubled their output value and profits in less than 1 year. Today all regions, prefectures, municipalities and counties are full of enthusiasm for the open door policy and economic cooperation. Of the localities, 17 regions, prefectures and municipalities and 57 counties have established agencies specializing in cooperation, many of which have issued announcements declaring an open door policy, introducing their strengths and publicizing preferential policies aimed at attracting capital, technology and qualified personnel.

The livelihood of the masses, whose earnings have been rising every year, has been improving continuously. According to a sample survey by the statistics department on 610 peasant families in different parts of the province, per capita income in 1984 was 310.4 yuan, 43.8 yuan more than in 1983. A study by the provincial agricultural bank on 570 households shows that per capita income in 1984 was 296.29 yuan. All this proves that the standard of living of the masses of peasants has visibly improved. Using a variety of approaches, the province placed altogether 310,000 unemployed people in jobs over the past 4 years, or almost 80,000 per year, thereby reducing the average number of dependents per worker from 2.03 in 1980 to 1.8 in 1984. The total wages of a worker at an enterprise owned by the whole people have been rising at an average annual rate of 9.7 percent. In 1984, workers' per capita earnings from wages reached 1,049 yuan, an increase of 267 yuan over 1980. Although the workers' cost of living index has been going up fairly rapidly, the real income of every worker still comes out ahead, as borne out by the excess of demand over supply for high-grade consumer goods. Savings deposits in both urban and rural areas, which have been increasing continuously, were worth 2.2 billion yuan at the end of 1984, up 37.5 percent over the end of 1983, or 3.2-fold over 1980. The figure of 2.2 billion yuan rose a further 440 million yuan by the end of June 1985. Studies show that in the first half of this year, per capita savings deposits in urban and rural Kunming reached 565 yuan. An unprecedented phenomenon has appeared: it is not easy to deposit one's money in a bank, and the public has been critical of the need to join long queues in order to make a deposit. In 1984 new housing construction in the province amounted to over 14 million square meters, of which more than 11 million square meters are rural housing. Over 210,000 peasant households built new houses, another eloquent piece of evidence that people nowadays are living better.

The changes in the countryside and in the cities brought about by reform are there for all to see. The people have benefited in tangible, practical and concrete ways. In their heart of hearts the masses are grateful for the party's sound policies. Examples of profound changes are too numerous to be mentioned one by one here. There was a village in Gudixiang, Gudi District in Binchuan County which was dubbed "Gandicun" because it suffered from drought year in year out. A few years back the village was dirt poor; of the 20 households in the village, half were "impoverished households." Since last year, it has been adjusting its product mix. This year per capita income went up more than 100 yuan over last year, recently 9 families were putting up new houses, and 12 households purchased large livestock. Even the "impoverished households" have bought watches and radios. Reform has brought hope and vitality to enterprises. The Tonghai County Arts and Crafts Factory is a small collective enterprise with an output value of merely 120,000 yuan in 1980. Last year, however, it boosted its output value to 7.26 million yuan, a rare achievement among collective enterprises in Yunnan, and was commended by the provincial leadership. Kunming Plate Glass Factory operated in the red for 9 consecutive years before 1979, a heavy burden for the enterprise. After the 3d Plenary Session of the 11th CPC Central Committee, the provincial government made the factory a test site for its experiment in enterprise autonomy expansion. That very year, 1979, the enterprise turned itself around and came up with a profit instead of a loss. As reform become more and more far-reaching, its output also went up year after year, as did its economic results. By 1984, the plant has finished 1,239,000 crates of plate glass, exceeding the state target by 21.4 percent, and earned 10.3 million yuan in profits. Overnight it became one of the enterprises in the province with 10 million profits.

Since the beginning of this year, our province has conscientiously been implementing Circular No 1 (1985) of the CPC Central Committee and Comrade Hu Yaobang's important instructions which he gave us when he toured Yunnan. Driven by party rectification and reform, the province's economy has continued to grow in a sustained, stable and coordinated way. The restructuring of the rural economic structure has borne its first fruits. A sample survey conducted by the statistics agency earlier this year on 2,400 peasant households shows that the per capita cash income among peasants has risen noticeably in the plains, semi-mountainous and mountainous regions over the corresponding period in 1984, from 120.86 yuan to 163.35 yuan, from 86.25 yuan to 118.97 yuan, and from 62.83 yuan to 75.21 yuan respectively. Moreover, the earnings of peasants who have gone into the building and tertiary industries have gone up markedly. Jinding District in Lanping County, for instance, was an infertile and impoverished mountain area. This spring it drew up a plan to get rich, and while basing itself on grain production, made a concerted effort to develop cash crops, aquaculture and late autumn cultivation. Although it was plagued first by drought and later flood, it still managed to increase total late autumn grain output by 2 percent compared with the year earlier. At the same time, it has organized a 2,000-member labor force to undertake mining in the mountains and started various projects in an array of industries, but mostly in transportation, building and commercial services. By broadening the avenues to wealth, it has achieved a remarkable record. In the first half of 1985, the entire area's rural economy took in 3.35 million yuan in earnings, an increase of 75 yuan per capita. For the province as a whole, total industrial output value for the first half of 1985 reached 5.96 billion yuan, a rise of 18.9 percent over the corresponding period in 1984. Moreover, we succeeded in accomplishing more than half of our tasks in over half the time. Within the industrial sector, light industrial output value grew 21.8 percent, faster than that of heavy industry. Collective industry expanded 26.7 percent, faster than industry owned by the whole people. Rural and township enterprises grew even more rapidly, more than doubling their output value over the first half of 1984. As for state enterprises, their output value, sales earnings, profits realized and profits turned over to the state are estimated to have risen by 21 percent, 22.8 percent, 36.7 percent and 27 percent respectively and will continue to advance at the same pace. Government revenues reached 1.11 billion yuan, an increase of 28.3 percent.

Comrade Zhao Ziyang has pointed out in the "Instructions on Drawing Up Proposals for the 'Seventh 5-Year Plan,'" "The primary purpose of our economic work in the past was to keep the people fed and clothed. Today the consumption pattern and industrial structure have changed considerably. As a vital stage in the improvement of China's economic standard, the days ahead will see the beginning of a shift from the staving off of hunger and cold to the pursuit of a moderately comfortable standard of living so that our people can be relatively well off by the end of the century." Experience proves that reform is in line with the basic interests of the vast majority of the people in the province and is therefore supported by the various nationalities.

[25 Oct 85 p 3]

III. How To Interpret And Solve The New Issues Which Have Emerged During Reform

The Situation In The Past Few Years Has Been The Best Ever Since The Founding of the PRC

That we have been able to obtain the above achievements is because we conscientiously implemented the resolutions of the CPC Central Committee on restructuring the economic system, carried out thoroughgoing reforms, opened ourselves up to the world and invigorated the domestic economy. The situation brought about by reform has indeed been excellent, better than expected. But the aim of reform is to build a dynamic, vital socialist economic system with Chinese characteristics, a formidable and complex piece of social engineering and a revolutionary change. This social change has no existing model to copy. We can only explore and review our experience as we go along. Talking to foreign visitors about China's economic reform, Comrade Deng Xiaoping said, "Of course, there will be twists and turns, even mistakes of varying degrees of gravity, in the course of reform, but that does not matter. As soon as we make a mistake, we will correct ourselves. If one approach does not work, we will try another."

As reform became more thoroughgoing, many problems have indeed appeared. For instance, there are energy and raw material shortages. Transportation and communications have come under intense pressure. Our industrial structure and product mix are not rational enough. Since the second half of 1984, particularly since the four quarter, industrial production has been rising too sharply, capital investments too high and expansion in credit and consumption becoming overheated. Some prices increases have been excessive. In short, new elements of instability have emerged in our economic life. These problems are clearly objective facts. Certain party and government organs and their cadres have set up phony companies under various labels by virtue of their public authority, bought and resold at a profit commodities in short supply, and engaged in fraudulent practices for selfish ends. Some state-run industrial and commercial enterprises have jacked up the prices of their merchandise at will. All these and other unhealthy trends have provoked strong public reactions and severe criticisms, and rightfully so.

What then are we to make of the present situation? Is it good or bad? We must assess it correctly. How to analyze a situation is a big part of Marxism. Correct principles and policies spring from the correct analysis of a situation. Since the 3d Plenary Session of the 11th CPC Central Committee, the party has analyzed the situation realistically and soberly and put forward correct policies. Like the rest of the nation, Yunnan's situation has been the best ever since new China was founded. The economy turned out to be stronger than expected. The masses' standard of living has gone up measurably. Unemployment, an intractable problem for years, has been successfully resolved. Stability and unity are being consolidated by the day. The reform is proceeding in the right direction and things are looking up. This is the essence of the present situation. If we fail to see that, we will lose confidence and become confused. Moreover, we should see that whatever problems existing at the moment are problems which have arisen in the course of progress. Compared to our remarkable achievements over the past few years, they are relatively minor. Some of them are unavoidable during reform and can be solved only through reform. Others happened because a particular measure was not carefully thought out beforehand or because after-the-fact investigation was less than thorough. We should learn from these mistakes. We must remain clear-headed. When we are blind to problems and difficulties, we may also make mistakes -- through incaution. There was a time in the past when we were sober as long as things were rough and became unrealistically optimistic once the situation got better. This lesson we must bear in mind.

On the other hand, we must not overemphasize the existing problems so much that we forget the chronic maladies under the old system. Consider this: What would we have done had there been no reform? Going back to the old days when we clung to the iron rice bowl and spent our days in poverty? That will not do. Stagnation and adherence to outworn ideas offer us no future. Even more hopeless is retreating as soon as we run into difficulties. We must have the courage to face up to problems which have emerged in the course of reform, adopt decisive measures aimed directly at them, and energetically search for solutions. Only such is the attitude of a communist. Some comrades are worried that our reform will lead to capitalism. That certainly will not happen. Comrade Deng Xiaoping told the National Party Congress, "We insist on two basic principles throughout reform: that the socialist economic system of public ownership remains our mainstream, and that we prosper together." As long as we adhere to these two principles, we will be able to ensure that socialism will not regress into capitalism.

Unstable Elements in Economic Life Can Be Removed Gradually

What is to be done about the existing problems? First, we must persevere with reform, especially the strengthening of macroeconomic control and management. Second, we must firmly stamp out the unhealthy trends.

Reform is the self-improvement and self-development of China's socialist system. Each and every one of our reforms has advantages and disadvantages; there is just no perfect reform. In the process of reform, old problems are got rid of only to be replaced by new ones. The only thing we can do is to tackle the new problems one by one as we gradually make our reform more far-reaching and better over time. Microeconomic invigoration is reform, as is macroeconomic management. In the past we understood little about the latter, hence we need to emphasize it now. The strengthening of macroeconomic control and management is also motivated by a desire to develop the excellent situation and ensure the smooth progress of reform and development. In the earlier period, we have done much to control the scale of investments in fixed assets, essentially the size of capital projects, the rate of growth of industrial output and consumption and to strengthen tax collection, credit and foreign exchange control. The economic situation from last January through August was better than expected. Problems which appeared for a while since the last quarter of 1984 -- sharp increases in investments in fixed assets, consumption and credit; excessive price hikes and the drop in the nation's foreign exchange reserves -- have slowly been brought under control. Industries which have been growing inordinately fast have slowed down; the growth rate of enterprises owned by the whole people, in particular, has returned to normal. All this demonstrates that problems are being solved.

The New Unhealthy Trends Are Not Caused By Reform

The healthy development of our great reform movement hinges on the correction of the unhealthy trends, which therefore must be given full attention. Now some comrades believe that these trends are caused by reform. They are mistaken. The new unhealthy trends has both historical and immediate roots. Their historical roots are the various lingering decadent ideas inherited from the feudal exploiting class of the old society. Their immediate cause are the invasion by corrupt foreign capitalist ideas and practices at a time when the country is being opened to the world. But essentially the new unhealthy trends are caused by something else. First, some of our party organizations, weak and lax, have neglected ideological and political work and the construction of the spiritual civilization. As a result, some party members and cadres lacking in party spirit were corrupted by decadent feudal and bourgeois ideas and, taking advantage of the opportunities provided by reform, indulged in an orgy of wrongdoing. Second, the present reform movement covers a vast area, from the economic base to the superstructure and including ideology, and involves very complex issues. The dismantling of old rules and regulations and the establishment of new ones requires a period of time. Meanwhile, reform's own imperfections often manifest themselves as loopholes and gaps readily exploited by those people eager to abuse their public office for private gains. There is no inevitable cause-effect relations between the present unhealthy trends and reform. If all party members and cadres take a firm party stand politically and ideologically, make stringent demands on themselves in accordance with the party's goals, recognize and resist all kinds of behavior that abuses public office for personal gains, then the remnants of the feudal ideology, decadent bourgeois ideas, the imperfections of reform and so on will in no way lead to the spread of unhealthy trends. Amid reforms to invigorate the economy, Comrade Ma Shengli [7456 0524 0448] of the Shijiazhuang Municipal Paper Products Company in Hebei upheld the party principles and correctly tackled the relations between the enterprise and the state, between the enterprise and consumers, between the enterprise director and the party organization, and between the director and the masses. He deals with matters involving public and private interests uprightly and properly and insists on using the power conferred by the party and the state to benefit society and the people. Never does he use the power to benefit himself or a small group. In this way he succeeded in earning the public trust and ensuring the smooth progress of reform. This example proves that as long as our party members, especially party cadres, act according to party principles even while they reform, and conscientiously relate their own particular piece of reform to the overall reform movement, reform will proceed successfully and will not lead to any unhealthy trends. Hence we say that it is incorrect to attribute the new unhealthy trends to reform.

In the course of correcting the unhealthy trends, we must also take pains to identify new problems, new phenomena and new methods which have emerged during reform and errors due to inexperience, and distinguish them, on the one hand, from the unhealthy trends, on the other. As pointed out by the Discipline Inspection Commission of the CPC Central Committee in a relevant document, "Some problems arise from inexperience and jurisdictional confusion. Some arise from individualism, a lack of consideration for the general interest and an exclusive concern with special interests. And some are violations of the law, pure and simple. At issue here are questions of understanding, ideology and ideological quality as well as trouble-making and sabotage by lawless elements." Therefore we must distinguish between problems caused by a lack of experience and unhealthy trends resulting from people taking advantage of reform to engage in illegal activities. We must not dismiss as unhealthy trends practices and behavior which contribute to the sound development of reform. Party committees and discipline inspection commissions at all levels must make detailed investigations and analyses to unravel the cause and effect of a problem. Was the mistake committed for the sake of reform or to benefit the interest of an individual or a small group? Did it occur because there were no clear regulations or because someone deliberately ignored the rules and knowingly broke the law? In short, we must stamp out the unhealthy trends in order to further reform, but in a way which will preserve the public's enthusiasm for reform.

IV. Current Major Reform Tasks

The "Seventh 5-Year Plan" period is a critical time for the wholesale restructuring of our economic system. Of the four basic guiding principles laid down by the CPC Central Committee for social and economic development during the "Seventh 7-year Plan," the very first one emphasizes that "we make reform our top priority and ensure that reform and development adapt to and promote each other." Explaining the three major tasks for this period, Comrade Zhao Ziyang also put reform at the top of his list and stressed that it is the most important. So it can be seen that our No 1 task today is reform.

It is an arduous task. When we say wholesale reform, we include the restructuring of the city-based economic system and reforms in the way we manage science, technology and education, among other things. As far as restructuring the economic system is concerned, we must come to grips with three major issues: invigorating enterprises, building a commodity market system and perfecting indirect control mechanisms.

Further Enhancing The Vitality of Enterprises

A condensed manifestation of the myriad ills afflicting the present economic system is the absence of vigor in our enterprises. In recent years, while small state-run enterprises and collective enterprises have shown more dynamism, few large and medium-sized enterprises owned by the whole people have really been invigorated. Yet such enterprises are the most vital and decisive element in the national economy. Numerically, large and medium-sized state-run industrial enterprises account for only 2 percent of all the nation's enterprises, but their fixed assets, profits and taxes constitute over 60 percent of the national total. The same pattern applies to Yunnan. Our 186 large and medium-sized industrial enterprises account for 70 percent of the province's total industrial output value and generate 86 percent of the revenues collected by the provincial government. It is exactly for this reason that the invigoration of enterprises, especially large and medium-sized enterprises, is the linchpin in the restructuring of the economic system. Toward that end, we msut first direct enterprises' attention inward. Instead of looking upward and outward and focusing solely on the state, consumers and users, they must make good use of the various kinds of autonomy conferred by the state to improve management and operations, speed up technical modernization, tap potential, continue to implement the internal economic responsibility system, pay attention to the material interest principle, strengthen ideological and political work and mobilize the enthusiasm of producers and workers. Second, we must do our best to improve the external conditions under which enterprises operate. For example, we must adhere to the principle of separating enterprises from government, further simplify administration and decentralize power, reduce their regulatory taxes appropriately depending on individual circumstances, and firmly prohibit the indiscriminate apportioning of expenses and fund-raising among enterprises to lessen their burden. A combination of internal and external efforts will enable enterprises to become genuine socialist commodity producers and operators which are dynamic and relatively independent, enjoy managerial autonomy and assume responsibility for their own profits and losses.

Develop A Planned Socialist Commodity Market And Gradually Perfect The Market System

The establishment and development of a socialist commodity market system is an objective need of the development of a planned commodity economy on the basis of a system of public ownership. This need includes more than the kind of need we are familiar with: the need to establish an open commodity circulation system which accommodates different economic forms and consists of a multitude and channels but fewer links; the need for industrial and commercial enterprises owned by the whole people, materials supply and marketing agencies and cooperatives to play an active part in market regulation; the need for industry and commerce administration agencies to strengthen market management and the need to expand energetically the production information market at a time when the consumer market is being expanded and so on. Even more vital is the need to reform the price system and price management system and gradually bring about a price system in which the prices of a minority of commodities and services are planned while those of the majority of commodities are allowed to float or completely decontrolled. In this way we will be able to make better use of prices as a regulator of production, circulation and consumption. In tandem with the development of a commodity market, we must also create a capital market, a technical market and a labor market. Only with the formation and gradual perfection of a socialist market system can the market mechanism be the driving force of the development of the socialist commodity economy that it is.

Perfect The State's Control Mechanisms, Primarily Indirect Control Mechanisms, With Regard To Enterprises

The perfection of indirect control mechanisms is a new issue which must be tackled urgently if sound macroeconomic control is to be a part of the national economy. We used to manage enterprises with direct control. Now we must replace that with essentially indirect control. In other words, we must rely mainly on economic and legal mechanisms, together with the necessary administrative means, to strengthen indirect control on economic activities on the macroeconomic level. This requires a wider use of such economic tools as prices, interest rates and tax rates, and a greater effort to formulate a series of economic laws, establish and strengthen economic supervision and an economic information network, and augment the functions of such agencies as those in banking, taxation, auditing, statistics, testing, standards, industrial and commercial administration and social notarization. The establishment and perfection of a macroeconomic indirect control system, including a planning system, economic leverage system, economic legislation system and economic organization system, is an important hallmark of the basis of the new economic system.

The intensification of enterprise vitality, the formation of a commodity market system, the perfection of indirect control mechanisms -- these three elements are closely interwoven and form a coherent whole. Once we master them, we will have basically laid the foundation for a dynamic, vital socialist economic system with Chinese characteristics.

Since the 3d Plenary Session of the 11th CPC Central Committee, Yunnan's economic front has carried out preliminary reforms. Without a doubt the splendid economic situation in the province -- simultaneous increases in industrial output, sales earnings, profits realized and government revenues for 4 or 5 consecutive years -- has a lot to do with the preliminary reforms in the economic system. To keep up the present excellent situation, we must carry on with our reforms resolutely and score new reform victories continuously.

In a recent speech, Comrade Hu Yaobang said, "We are in the middle of wholesale reform. And reform is something which affects us most intimately. Even as we reform all kinds of systems, we must change our own ideas, ways of thinking and mind-sets which are incompatible with the times so that our ability to understand and our work will be more suited to the needs of the party and people." To do so we must conscientiously study instructions by the CPC Central Committee and State Council and national party congress documents, correctly understand the essentials and nonessentials in the current situation, relate the ideas of the masses to the spirit of the Central Committee and adapt our mentality and way of doing things to the needs of the new situation. Only thus can the restructuring of the economic system in Yunnan develop healthily in the right direction.

Reform is also history in the making. In the present reform movement, the people of all the great Chinese nationalities are writing a new and glorious chapter in China's history. Therefore reform is not the doing of a minority of people, but the history-making undertaking of the broad masses. Every Chinese citizen, not to mention every cadre, every CPC member, should throw himself into the reform movement enthusiastically, concern himself with it and support it. Instead of being a bystander, he must feel a sense of responsibility for it. Instead of distancing himself from it, he should always ask himself what he has done for it.

In short, if only the vast numbers of cadres and the masses plunge themselves into the mighty torrent of reform and have the courage to experiment and explore in the direction pointed out for us by the CPC Central Committee, our reform movement will succeed.

SHANGHAI MAYOR GIVES 5-YEAR PLAN REPORT

OW210527 Shanghai WEN HUI BAO in Chinese 5 May 86 pp 1-3

[Report on Shanghai's Seventh 5-Year National Economic and Social Development Plan--by Shanghai Mayor Jiang Zemin at the Fifth Session of the Eighth Shanghai Municipal People's Congress on 25 April 1986]

[Text] Fellow deputies:

At the request of the Shanghai Municipal People's Government, I am going to report on Shanghai's Seventh 5-Year National Economic and Social Development Plan. Please examine it, along with the plan itself, which has already been given to you.

I. A Review of the Work Accomplished During the Sixth 5-Year Plan.

According to Shanghai's Sixth 5-Year Plan, approved by the First Session of the Eighth Shanghai Municipal People's Congress during the 1981-1985 period, Shanghai had to continue to implement the principles for readjustment, restructuring, consolidation, and improvement. Around the central task of achieving better economic returns, ensuring steady production growth, and achieving the target for state revenue, Shanghai had also to create a new situation for opening to the outside world and promoting internal cooperation, and to create conditions for further growth during the Seventh 5-Year Plan. Thanks to the guidance of the party Central Committee and the State Council, support from fraternal provinces and municipalities, and the efforts exerted by the people of Shanghai during the past 5 years, the mission was successfully accomplished.

In 1985, Shanghai's gross national output reached 46.7 billion yuan, representing a growth of 54.4 percent over 1980 and an average annual growth of 9.1 percent; gross industrial and agricultural output reached 89.3 billion yuan, representing an increase of 44.2 percent over 1980 and an average annual growth of 7.6 percent. Personal income reached 40.7 billion yuan, representing an increase of 49.8 percent over 1980 and an average annual growth of 8.4 percent. The municipality's revenue reached 26.39 billion yuan, representing an increase of 32.7 percent over 1980 and an average annual growth of 5.8 percent. This economic growth was faster and better than anticipated.

During the Sixth 5-Year Plan, industrial and agricultural production continued to grow steadily. Because of increasing output and variety of consumer goods and nonstaple food, the market had an ample supply of goods the public needed. Compared with 1980, the output of television sets, tape recorders, refrigerators and washing machines for household use increased several times, sometimes more than a hundredfold, in 1985. The output of vegetables, poultry, eggs, dairy products, and freshwater fish also increased significantly. Urban and rural markets alike were thriving and brisk.

During the Sixth 5-Year Plan, Shanghai invested an aggregate 35.1 billion yuan in fixed assets. The investment was 2.6 times higher than that of the Fifth 5-Year Plan. Construction of major projects proceeded quickly. The first-stage construction of the Baoshan Iron and Steel Complex and the second-stage construction of the Jinshan Petrochemical Complex were completed ahead of schedule and put to test operation.

Also commissioned were a great number of large and medium-size mainstay projects, including the container wharf of Shanghai Port's Zone No 9. New headway was made in transforming the technology of a large number of enterprises. The construction of urban infrastructure began to gain momentum. During the 5-year period, Shanghai spent 5.15 billion yuan on developing communications and transportation, posts and telecommunications, energy, and other public facilities. The expenditure was 84.5 percent more than that spent during the Fifth 5-Year Plan. The volume of passenger and cargo transportation and of postal and telecommunications services were growing. Shanghai Port has become one of the world's largest seaports, whose annual handling capacity has exceeded 100 million metric tons each.

Scientific and technological work, education, public health, cultural activities and sports continued to develop. During the 5-year period, over 5,000 scientific and technological achievements were recorded. The enrollment in schools of higher education grew at an average of 12.7 percent annually. Secondary vocational, technical, and adult education also achieved significant development. Accomplishment in certain areas of medical technology reached the advanced world level. New successes were achieved in such areas as journalism, publishing, radio and television broadcasting, literature and art. A large number of artists and athletes won great honors for the country and Shanghai with their outstanding performances in tournaments at home and abroad.

During the Sixth 5-Year Plan, the people's living standards improved noticeably. After adjustment for price rises, a worker's average income in 1985 was 38.2 percent higher than in 1980, and the peasants' average per capita income increased by 62 percent. By the end of 1985, bank savings by urban and rural inhabitants had reached 7 billion yuan, an increase of 2.3 times over that recorded at the end of 1980. During the 5-year period, urban and rural inhabitants' actual consumption grew by an average of 7.1 percent annually, higher than the anticipated 4 percent. The people's consumption pattern also changed significantly. More money was spent on clothing. Thanks to the completion of living quarters with a total floor space of 20.25 million square meters during the 5-year period, 170,000 families who had housing difficulties, and nearly 160,000 other families had their living conditions improved.

During the Sixth 5-Year Plan, exchange and cooperation with foreign countries continuously expanded. By 1985 Shanghai had established economic and trade relations with 160 countries and regions, had formed friendly ties with 14 cities in 12 countries, and had expanded its scientific, technological, and cultural exchange with foreign countries. Visitors and tourists in Shanghai have increased each year; Shanghai received 600,000 foreign guests and tourists in 1985, a 190-percent increase over 1980.

During the Sixth 5-Year Plan, Shanghai strengthened the legal system, cracked down on serious crime in general and serious economic crime in particular, and tackled such problems in a comprehensive way, thus bringing about a noticeable turn for the better in public order.

Shanghai has made tremendous achievements in socialist modernization over the past 5 years, during which the economy in the municipality has changed from a semiclosed to an open economy. This is a strategic change. At the same time, urban construction has been accelerated, and the people's living standards have noticeably improved. All this has laid a foundation for Shanghai's transformation and vitalization. The political and economic situation in Shanghai, like that in other parts of the country, is one of the best since the founding of the PRC. Practice has effectively proved the correctness of the line, principles, and policies laid down by the party since the 3d Plenary Session of its 11th Central Committee.

In the past 5 years, we have paid particular attention to our work in the following three aspects while implementing a series of major principles and policies laid down by the party Central Committee and the State Council:

1. Readjusting the Economy and Consolidating Enterprises to Put Our Economic Work on the Correct Course for Improving Economic Results.

When the Sixth 5-Year Plan was just put into practice, the party Central Committee laid down the major policy of "Making further economic readjustment and bringing about further political stability" and set the requirements for better economic results. In the course of economic readjustment, there were shortages of products on the market and insufficient production tasks for heavy industrial enterprises in Shanghai for a time. While inspecting Shanghai's work in July 1981, Premier Zhao Ziyang gave us important instructions on economic development and technological progress in the municipality. Keeping in mind Shanghai's realities and its market situation, we implemented the "Six-Priority" policy measures for the development of light and textile industries. As a result, the pace of improving product quality and making new generations of products in light and textile industry has been accelerated, and the output of quality and famous-brand consumer goods for daily use has doubled and redoubled. At the same time, we have readjusted the product mix in heavy industry and oriented it toward serving the technical transformation of light and textile industry and agriculture. Through such readjustment, production in heavy industry has steadily increased. The economic structure in Shanghai's suburbs and rural areas has also been readjusted. As a result, agricultural production has remained stable and has embarked on the path of joint operation and coordinated development. Meanwhile, more than

4,000 state enterprises and over 5,000 collectively owned enterprises have been thoroughly consolidated group by group at different times, thus improving their quality and economic results. Through readjustment and consolidation, the ratio between light and heavy industry has become rational. The proportion of tertiary industry in the gross national product increased from 21.1 percent in 1980 to 26 percent in 1985. Economic growth has remained steady.

2. Persistently Carrying Out Reforms and Opening to the Outside World to Adapt the Economic Structure to a Planned Commodity Economy

During the Sixth 5-Year Plan, acting on the central authorities' policies of carrying out reforms and opening to the outside world, we have practiced the output-related system of contracted responsibility, reformed the system of fixed quotas for state purchase of agricultural products, on fixed quotas, and accomplished the task of separating administration from commune management; we have developed more than 4,000 specialized households and integrated economic establishments of various types. Such specialized households and integrated economic establishments are playing a positive role in improving economic results, promoting commodity production, and invigorating rural trade. The reform of the urban economic structure has been gradually developing while seeking ways to do things better in this regard. Enterprises have been invigorated by giving them greater decisionmaking power, allowing them to retain a portion of their profits, and substituting taxes for delivery of profits to the state. Thus, the enterprises now have their responsibilities, rights and interests in planning, production, supply, marketing, labor and personnel matters. In enterprises, various forms of responsibility system have been instituted. The system of responsibility by the factory director (or manager) has been practiced on a trial basis in more than 600 enterprises. To increase enterprise vitality, experiments on the reform of the enterprise wage system have been conducted on the principle of distribution according to work. In commodity circulation, we have been engaged in an open-type of operation and management, incorporated seven Class 1 wholesale stations into municipal corporations, set up more than 400 market places, and decontrolled prices of non staple foodstuffs and small commodities. Thus, a multichannel system of circulation with few intermediate links is taking shape. With the deepening of the reform and the invigoration of the economy, we have developed the collective and individual economies and the economy characterized by joint ventures using Chinese and foreign investment and enterprises operated exclusively with foreign investment, with the economy under the ownership of the whole people as the leading factor. Moreover, in accordance with the CPC Central Committee's decision on the reform of the science and technology management system, we have started reforming the system of allocating funds for scientific research projects and made vigorous efforts to open up a technology market and develop various scientific research associations in order to make science and technology better serve economic construction. At the same time, the reform of the educational system has also gradually developed.

The Party Central Committee and the State Council have always attached importance to Shanghai's opening to the outside world. In 1983, the State Council approved Shanghai's recommendat-on on promoting the city's foreign trade. In 1985, it approved and transmitted Shanghai's preliminary plan for further opening to the outside world. During the Sixth 5-Year Plan, Shanghai expanded its import-export-trade-only foreign economic exchanges to cover more fields, including use of foreign capital, introduction of foreign technology, buidling use of foreign capital, introduction of foreign technology, building overseas construction projects, and export of technology and labor service. During the 5 years, 242 contracts on the use of foreign capital amounting to $1.27 billion were signed. From 1983 to 1985 858 foreign technologies worth $890 million were imported. Some of the imported technologies have been put into operation with good results.

Shanghai has also made great progress in domestic economic cooperation. In 1984, we formulated some policies and measures regarding the development of domestic economic cooperation. We have since strengthened our lateral ties with other localities in economy, technology, personnel, information, and management. We have successively developed cooperation with 28 fraternal provinces, municipalities, and autonomous regions in setting up some 2,000 economic associations and undertaking some 300 joint resource development projects. We have also cooperated on more than 5,000 programs involving either joint research or the transfer of scientific and technological achievements. The cooperation has brought about closer economic ties between Shanghai and fraternal provinces and municipalities and has promoted their common economic development.

3. Formulation of an Overall Economic Development Strategy and a General Urban Development Plan Has Set Clear and Definite Objectives for Shanghai's Transformation and Development

The Party Central Committee and the State Council, very much concerned about Shanghai's economic and social development, have repeatedly issued important instruct-ons on Shanghai's transformation and development. The cadres at all levels, theoretical workers, practical workers, and personages from all circles in Shanghai have spent a fairly long time on research and exploration for a long-range plan for Shanghai. In 1984, the State Council sent an investigation and research group to Shanghai to help us research economic development questions. We then invited some Chinese experts and scholars of relevant specialities to a symposium on Shanghai's economic development strategy. After comprehensive research and discussion, we prepared a report outlining Shanghai's economic development strategy. In the report, we have clearly and definitely set the objectives, principles, tasks, and measures for Shanghai's economic development, and we pointed out that Shanghai's tasks in the near future are to readjust the structure of production, promote technical progress, improve basic urban facilities, and bring about a coordinated development of all sectors. In February 1985, the State Council approved the outline. In accordance with the outline, we have formulated a general urban development plan of Shanghai, which clearly defines the urban layout. The plan calls for putting the stress of development on the Pudong District, developing satellite cities, expanding southward towards the Hangzhou Bay and northward toward the estuary of the Changjiang step by step, and building small suburban towns in a planned way in the course of transforming and building Shanghai proper. The Central Secretariat has in principle agreed to the general urban development plan. The formulation of the economic development strategy and the general urban development plan shows that Shanghai's transformation and development have begun a new stage.

Although great changes took place in Shanghai's economic and social situation during the Sixth 5-Year Plan, our work still lags behind the expectations of the Party Central Committee and the State Council as well as the demands of the Shanghai people. At the same time, we still have many difficulties and problems. On the one hand, some reform measures are not coordinated, and the reform of the macroeconomic management system cannot fully meet the needs of the work of invigorating microeconomic activities, affecting the vitality of enterprises and obstructing the market from fully playing its role. The economic structure has not yet been straightened out. There are too many levels of government organization; bureaucratic workstyle of arguing back and forth and being dilatory still exists to a varied degree, and attention given to the building of socialist spiritual civilization is insufficient to meet the needs of the four modernizations. On the other hand, Shanghai has the problems of insufficient basic urban facilities, heavy city street traffic, poor telecommunications, housing shortage, serious pollution, insufficient cultural facilities, irrational geographical distribution of industrial enterprises, insufficient floor space in enterprises and factories, backward technology and equipment, slow progress in developing a new generation of products, big waste in raw and processed materials and energy, failure to increase export and foreign exchange earnings in the last few years, serious deficiency in local financial resources, and limited foreign exchange reserves. Because of the aforesaid problems and difficulties, we think Shanghai is facing a severe challenge. Therefore, we must seriously sum up experience, do a still better job in all reform and construction, strive to make greater achievements during the Seventh 5-Year Plan, and greatly improve Shanghai's situation.

II. Principles and Major Tasks of the Seventh 5-Year Plan

Deputies, the Seventh 5-Year Plan, which was approved in principle by the Fourth Session of the Sixth NPC, shows bright prospects for China's economic and social development in the last 5 years of the 1980's, and inspires us to work hard in unity to fulfill this grand plan. As an important component of China's Seventh 5-Year Plan, Shanghai's Seventh 5-Year Plan is formulated in line with a general demand for building socialism with Chinese characteristics, a basic principle for invigorating domestic economy and opening to the outside world, the demands set by Shanghai's economic development strategy, and the proposal of the municipal party committee for Shanghai's Seventh 5-Year Plan. During this period, Shanghai will adhere to the following important policies and principles in economic and social development:

--Giving priority to reform, actively promoting reform of the economic structure, and making sure that reform and development are adapted to, and promote, each other;

--Resolutely controlling the scale of investment in fixed assets, rationally readjusting the investment structure, and ensuring the completion of key construction projects;

--Giving top priority to improving economic results and particularly to improving product quality and lowering material and energy consumption, and correctly handling the relationship between economic results and growth rates and between quality and quantity;

--Stepping up construction of basic urban facilities, and integrating gradual transformation of old city districts with speedy building of the new;

--Taking a further step to developing an open domestic economy and open to the outside world, enhancing the ability to export and earn more foreign exchange, and better integrating Ohanghai's production and construction with the efforts to expand domestic and international economic and technological exchanges;

--Persisting in putting science and education at an important strategic position, promoting scientific and technological progresses, and accelerating the development of intellectual resources.

--Comprehensively adopting advanced technology, and accelerating the transformation of traditional industries and the development of new industries in a selective way;

--Readjusting the structure of production according to plan and speeding up development of tertiary industry;

--Further improving the urban and rural people's material and cultural life as production and productivity grow; and

--Energetically stepping up the building of socialist spiritual civilization while promoting the building of socialist material civilization.

Many things remain to be done during the Seventh 5-Year Plan, and we must prioritize them. In accordance with the proposal of the municipal party committee for the Seventh 5-Year Plan, we should put the stress on three major tasks: 1) to step up construction of basic facilities and improve the investment and living environment; 2) to actively use foreign capital, increase export and foreign exchange earnings, and expand domestic and international economic and technological exchanges; and 3) to accelerate scientific and technological progress and personnel training and promote the development of economy and other undertakings. These three tasks are the key to building Shanghai into an open, multifunctional and modern socialist city.

For these reasons, the fighting goals of Shanghai's Seventh 5-Year Plan are: By 1990, the gross national product will reach 67.3 billion yuan, or double that of 1980, representing an annual growth rate of 7.5 percent; the total output value of industry and agriculture will reach 118.65 billion yuan (not including output value of the cooperative and individual economy), an increase of 92 percent as compared with 1980, representing an annual growth rate of 6 percent; national income will reach 57.2 billion yuan, representing an annual growth rate of 7 percent; and local state revenue will reach 23.1 billion yuan, representing an annual increase of 5 percent. During the 5-year period, the total amount of local investment in fixed assets will be 22 billion yuan, an increase of 50.1 percent as compared with the Sixth 5-Year Plan. By 1990, we will complete the building of a number of key capital construction projects and modern enterprises in the municipality. On the basis of popularizing 9-year compulsory education, the number of professional people in various fields in the municipality will increase by 65 percent during the 5-year period.

We will earn more foreign exchange through exports, with an annual increase of 8.4 percent for the period. Consumption levels of urban and rural residents will increase by about 6 percent annually and their living standards and environment will be further improved. Fulfillment of the Seventh 5-Year Plan will place Shanghai's economy on an upward trend and prepare for continued economic development in the 1990's.

I wish now to explain some of the main questions concerning the municipality's Seventh 5-Year Plan:

1. Maintaining an Appropriate Economic Growth Rate While Increasing Economic Results

In transmitting the "outline of the strategic plan for Shanghai's economic development," the State Council's circular pointed out. "In evaluating Shanghai's economic work in the future, it is imperative to consider Shanghai's contributions to the building of the four modernizations in the whole country as the principal criterion. Therefore, the 'gross national product' should be the primary target." Based on this requirement, our principal fighting goal during the Seventh 5-Year Plan is to double the gross national product by 1990 as compared with 1980 and to increase the total output value of industry and agriculture by 92 percent during the same 10-year period. The task of the Seventh 5-Year Plan is to smooth the way for improving economic relations, readjust the production structure, promote technological transformation, and raise econo-ic results in order to create a favorable economic environment for carrying out reform of the economic structure in an all-round way.

On the other hand, in the course of developing Shanghai into a multipurpose central city, we must continue to develop the positive role of Shanghai's old industrial bases. While constantly raising technological levels and economic results, we must maintain a stable rate of industrial growth. This is to meet the need of expanding exports, making the market prosper, increasing construction funds, and accumulating more money for the state and also to lay an important material foundation for revitalizing Shanghai's economy. During the Seventh 5-Year Plan, the annual increase of Shanghai's industrial production will be 6 percent, with that of light industry to be 5.8 percent and that of heavy industry, 6.3 percent. The growth of Shanghai's industrial production will mainly depend on technological progress, improved management, increased product quality, reduced materials consumption, and increased economic results. We must speed replacing old products with new ones in producing consumer goods and develop medium- and high-grade products as well as famous brand products in order to meet the people's needs and the demand of the international market. Those enterprises that produce equipment should speed their own transformation, import and absorb advanced foreign technology, and supply outstanding and advanced equipment for various economic departments and export. Those enterprises that produce raw materials should use the Baoshan Iron and Steel Complex, the Jinshan petrochemical plant, and other existing enterprises as the foundation and intensify processing work in order to meet the needs of production and construction by supplying high-quality, refined, and specialized products and to replace imports. In developing new industries, we must lay stress on developing microelectronics, optical fiber communications, new materials, and biotechnology and strive to achieve good results and gradually build these industries.

2. Accelerating the Construction of Basic Urban Facilities and Improving the Investment and Living Environment

According to the arrangements of the national planning conference, Shanghai's total investment in fixed assets during the Seventh 5-Year Plan will be 22 billion yuan, 9.2 billion yuan of which will be invested in capital construction and 12.8 billion yuan in technological transformation. Such an investment scale is far from meeting Shanghai's development needs. Therefore, all departments and organizations should consider the overall situation, make proper arrangements, and do things according to their capability and the principle of making overall plans and considering all factors to ensure completion of key projects.

Our basic urban facilities, particularly our harbor, railroad, air transport, postal, telecommunications, and urban transport facilities, are strained and overloaded, creating conspicuous obstructions to Shanghai's economic and social development and its efforts to develop an open domestic economy and to open to the outside world. For this reason, we have increased basic facility investment in proportion to the total investment in fixed assets in the municipal Seventh 5-Year Plan. Investment in urban public utility, transport, postal, telecommunications, energy, and housing projects for the 5 years will amount to 9.04 billion yuan, accounting for 41 percent of the total investment in fixed assets in the Seventh 5-Year Plan and an increase of 65.4 percent as compared with the Sixth 5-Year Plan. This investment reaches 10 billion yuan if investment in building marketable houses, which is not included in the plan, is included. We will also use foreign investment to accelerate the construction of basic facilities.

With the investment, we will undertake a number of key projects during the Seventh 5-Year Plan. In order to benefit sooner from the investment, we plan to complete some key projects in two stages.

During the first stage, or the first 2 years of the 5-year plan, we plan to complete a new railroad passenger station, the first phase of the outer loop of the Shanghai-Hangzhou railroad, the Yanan East Road river-crossing tunnel, the first phase of the water-drawing project on the upper reaches of the Huangpu Jiang, the first phase of the Pudong gas plant, the widening of Hongqiao Road, an overpass for motor vehicles on Jiaotong Road, a 125,000-kilowatt generator at the Minhang power plant, and a telecommunications building.

During the second state, or the last 3 years of the 5-year plan, we plan to complete the Shanghai-Jiading and the Xin-Song [5450 2646] first-class highways, the remainder of the project involving the outer loop of the Shanghai-Hangzhou Railroad, the remainder of the water-drawing project on the upper reaches of the Huangpu Jiang, the second phase of the Pudong gas plant, the improvement of a bottleneck near the Waibaidu Bridge, the widening of Chengdu

Road, the expansion of the passenger terminal building at the Hongqiao airport, a number of shipping berths at Guangang, generators with a total power-generating capacity of 1.8 million kilowatts at the Shidongkou No 1 and No 2 power plants, the Shanghai sections of three 500,000-volt transformer lines leading from Shanghai to Xuzhou, Huainan, and Gezhouba, and the installation of additional telephones bringing the city's total number of telephones to 600,000.

During the Seventh 5-Year Plan, we will use foreign investment to build subways, the Huangpu Jiang Bridge, the East District sewer project, and the Pudong development project.

During the Seventh 5-Year Plan, we will also complete a number of new houses, guest houses, and office buildings. By 1990, the outlook of Shanghai's urban districts will improve markedly, with the Shanghai railroad station and airport taking on a new look and a number of highrise buildings standing in Hongqiao District. There will be a wide and beautiful road between Waibaidu Bridge and Waitan. The old city district will be surrounded by a number of new housing areas, and some slum areas will improve in appearance.

To fulfill the abovementioned tasks, the following work should be done well:

First, urban planning should receive close attention. In accordance with Shanghai's comprehensive urban development plan, planning departments at all levels should follow the principle of "coordinating efforts to formulate unified plans, and increasing efficiency by allowing these plans to be managed at various levels." They should speed up the formulation of plans for various professions and zones, as well as of other detailed plans.

Second, adequate preparations and plans for the construction of infrastructural facilities should be made without fail. Great attention should be given to feasibility studies and comprehensive arrangements. The plans should be implemented in groups and by stages so as to concentrate on carrying out an all-out campaign and to devote our limited financial, material, and human resources primarily to the construction of key projects in order to maximize their social and economic results.

Third, full attention should be given to the comprehensive plan for improving the environment. The goal is: By 1990, despite the considerable progress in production, the amount of pollutants discharged by the entire city shall be kept at the 1982 level. The requirements in some aspects and in environmental quality in some areas shall be raised. Emphasis should be placed on controlling environmental pollution in the Hetian area. Under the Seventh 5-Year Plan, attention should be given to improving the method of city garbage disposal. Greenbelt areas should be expanded, so that per capita greenbelt area will increase from .7 square meter in 1985 to 1 square meter in 1990.

Fourth, city administration should be strengthened. This is an important task for implementing urban planning, raising the operational efficiency of public utilities, and beautifying the city. Therefore, we should strive to effectively manage the city's plans, land, environment, construction, traffic, appearance, and hygiene.

To accelerate the construction of infrastructural facilities in Shanghai, the support and cooperation of all quarters are needed. All localities, units, departments, and residents should actively cooperate with the departments concerned in land requisition and relocation, so that all projects will progress smoothly as scheduled.

3. Vigorously Developing Science and Technology, Promoting the Transformation and Revitalization of Shanghai

Science and technology are central to revitalizing Shanghai, promoting the four modernizations, and catching up with world levels in hi-tech development. They are also the key to preserving Shanghai's strong points. Therefore, we must realize the strategic significance of scientific and technological development, attach importance to scientific and technological progress, and make all quarters feel the need of developing science and technology. Development of economic work in all aspects should rely on scientific and technological progress, while science and technology should strive to serve economic construction and social development.

To promote science and technology, the first objective is to vigorously develop and popularize scientific and technological projects that yield good and quick results, and to actively adopt new technologies to transform traditional industries and improve their production techniques. During the Seventh 5-Year Plan, the major goals to be fulfilled in order to promote Shanghai's industrial technology are: The leading force should be those products designed to catch up with and surpass advanced world levels; the starting point should be to absorb and digest advanced technologies at home and abroad; the purpose should be to achieve better economic results and increase foreign exchange earnings; and emphasis should be laid on transforming and developing the 9 traditional industries, namely, textiles and garment, foods and beverages, home appliances, precision machinery, power equipment, communication equipment, metallic materials, high polymer materials, and building materials, involving 40 broad categories of products and 161 backbone enterprises. Industrial departments should pay attention to development and research of new products, establish intermediate experimental departments, actively adopt international standards, and see to it that more than 2,500 new products are developed in Shanghai in 5 years' time. By 1990, the technology, equipment, and major products, export products in particular, of Shanghai's major industries should reach the level of the developed countries of the late 1970's and early 1980's, with some products catching up with the international level of 1990. In agriculture, it is necessary to cultivate and popularize fine-strain seeds and high-yield technologies, establish bases for developing nonstaple food technology, actively implement the "spark plan," and use science and technology to serve agriculture and village and town enterprises. Under the Seventh 5-Year Plan, Shanghai will designate 125 key scientific and technological achievements for popularization. This will help quickly transform scientific research results into production forces.

In developing science and technology, it is necessary to coordinate the efforts of all quarters concerned to tackle major assignments and key technological projects for our economic and social development. All scientific research units should take the initiative in carrying out key scientific and technological projects of the state, and strive to complete the municipality's 24 key projects, including technological transformation of outdated industry, establishment of new industries, urban infrastructure, and major topics in medical science and agriculture, which urgently need to be solved. At the same time, it is necessary to pay close attention to digesting, assimilating, and updating imported technologies, as well as domestic development of their auxiliary equipment. Efforts should be concentrated on domestic development of the sundry components for Shanghai Sangtana sedans, color TV sets, and refrigerators among the 300 technological projects to be imported, digested, and assimilated during the Seventh 5-Year Plan, so that at least 80 percent of the components will be manufactured domestically. Urban construction, transport, postal, telecommunications, and other departments will actively adopt advanced foreign technologies to raise their design, construction, operational, and management levels.

It is necessary to make the best use of Shanghai's advantages in science and technology to develop high technology and continue to intensify the study of basic and applied sciences in order to prepare for the reserve scientific and technological forces for economic, scientific, and technological development and social progress for the next decade, or even the next century. In developing high technology, it is necessary to focus on micro-electronics, optical fiber communications and biological technology, and study and develop new materials, thereby facilitating the establishment and advances of new industries. Efforts should be made to intensify the study of high technology in the fields of laser, remote control, flexibility processing, space, and nuclear technology. In the study of basic sciences and their application, we should strive to complete a number of projects, with the world's advanced level, in molecular biology, solid physics, applied mathematics, applied chemistry, and medical science. In studying the prevention and treatment of malignant diseases, we should consolidate and expand research into cancer and other areas where China is already leading other countries.

In developing science and technology, it is necessary to further reform the scientific and technology management system and adopt appropriate policy measures, especially in the following four fields: First, it is necessary to increase expenditure for science and technology by making the increase in the appropriation for science and technology higher than that in regular local financial revenues, reform and perfect the appropriation system for scientific research institutes, improve and popularize the contract system listing remunerat-on, and institute the funding system for basic science research projects. Second, it is necessary to build up economic departments' strenth to develop science and technology by allowing enterprises to include scientific research expenses into their cost and spend most of the income from transferring the fruits of their projects on technological development, and by giving preferential treatment in regulatory tax reduction or exemption, in accordance with the government regulation governing higher depreciation rate of fixed assets, to enterprises actively adopting advanced technology and equipment to upgrade themselves technologically. Third, it is necessary to bring into full play the role, and more effectively coordinate the efforts, of Shanghai's scientific research units affiliated to the Chinese Academy of

Sciences or other central research units, military industry units, institutes of higher learning, and local scientific research organizations. Fourth, it is necessary to energetically explore and enliven the market and develop various forms of association combining scientific research with production. Besides, it is necessary to reform the job title evaluation system and introduce that of engaging specialized technical posts in accordance with the State Council's unified arrangements, to further harness the enthusiasm of the large numbers of scientific and technical personnel.

4. Promoting the Undertaking of Education, Intensifying the Training of Specialized Personnel

It is our steadfast long-range strategy to attach great importance to education, a cornerstone of our modernization drive. To achieve a relatively big advance in education during the Seventh 5-Year Plan, we should make vigorous efforts for education, making primary education become unversal, training specialized personnel in various fields, and striving to increase educational expenditures by 2 percent over the growth of regular local financial revenues.

The 9-year compulsory educational system is the foundation for the entire educational undertaking. Special attention should be paid to improve education in rural areas. Since the key to improving the quality of education lies in raising the quality of teachers, priority should be given to developing normal education to ensure the source and quality of students of normal colleges and schools. It is necessary to stabilize and expand the contingent of teachers, set up a system of advanced study and evaluation of teachers, and vigorously unfold the activity of respecting teachers and stressing education, thereby mobilizing the whole community to show great interest and concern for the undertaking of education. All districts will make senior middle school education universal by 1990, and the suburban counties will strive to basically popularize junior middle school education within the next 2 or 3 years. It merits our attention that a peak in nursery school, kindergarten, and primary school enrollment is approaching within the next few years, and it will require the cooperation of various quarters in adopting effective measures to successfully carry out this important task having a vital bearing on the quality of the next generaton. Besides, attention should be given to rebuilding dangerous primary school buildings.

While popularizing compulsory education, we must follow the policy of gearing our work to the needs of modernization, of the world, and of the future and to the all-round development of moral, intellectual, physical, and aesthetic education, and must strive to develop educational work in the following four aspects in order to train various kinds of specialized and qualified people for appropriate jobs:

First, we must develop vocational and technical education by gradually establishing a sound training system consisting of vocational and technical schools of senior and middle school level in all fields which can be linked to the regular school system. We must also pay particular attention to training senior technical workers who have abundant practical experience and are proficient in their work.

Second, we must strengthen higher education. We must fully tap the potentials of existing universities and colleges and further expand these schools, readjust the faculties and administrations of schools of higher learning, accelerate growth in those fields where we are lacking or are weak, and support the expansion of new branches of learning and frontier sciences.

Third, we must firmly grasp education for adults, pay attention to the principle of integrating study with application and use various methods, ways, and forms to promote adult education at various levels.

Fourth, we must actively and effectively run various training and research classes for advanced economic and technical management cadres.

During the Seventh 5-Year Plan, the municipality's regular schools of higher learning will be able to supply some 170,000 polytechnic and regular class and graduate school graduates to various sectors; of these, over 80,000 graduates may be allocated to the municipality. Adult education schools of college level will train some 130,000 people; full-time polytechnic schools of secondary school level will train 92,000 people; secondary vocational and technical schools will train 28,000 people; adult education schools of polytechnic school level will train 110,000 people; adn the various technical schools will train 100,000 people during the period. The number of advanced and secondary level technicians in proportion to the total number of technicians will be raised from 32 percent in 1985 to 55 percent in 1990.

On the one hand, we must develop education and make great efforts to train people. On the other hand, we must foster the social habit of respecting knowledge and capable people, assign people to appropriate posts, and provide opportunities to capable people, including those who have acquired knowledge and skills in various fields through self-study, so as to promote the development of various fields of work.

To develop education and speed up training of people during the Seventh 5-Year Plan, the key lies in doing a good job in reforming the educational structure. We must continue to correct our thinking in education; vigorously improve the content, methods, and quality of teaching; strengthen education on ideals, morals, discipline, and the legal system for students; guide students to integrate theory with practice and to integrate themselves with the workers and peasants; encourage students to develop their thinking and pioneering spirit; unfold beneficial cultural and sports activities to improve student health conditions; continue reforming the educational management system; expand the schools' decisionmaking powers while strengthening centralized guidance and control; gradually implement the system of having the school principal or president assume full responsibility of school administration; and reform and improve the enrollment system and the allocation of graduates to various jobs.

5. Actively Increasing the Use of Foreign Funds and Raising the Ability to Increase Our Foreign Exchange Earnings

During the latter part of the Sixth 5-Year Plan, the municipality quickened its pace of utilizing foreign funds, which was a good beginning. During the Seventh

5-Year Plan, we must utilize foreign funds more effectively and on a bigger scale. We must create a new situation, lay stress on building capital construction projects in the municipality, expand exports, produce items which had to be imported so far, carry out important technical transformation, and develop tourism, cultural facilities, and other necessary tertiary industries.

We still lack experience in utilizing foreign funds for building capital construction projects in the municipality, and therefore we must follow the principle of being positive and prudent. On the one hand, we must free our thinking and be bold in obtaining loans; on the other hand, we must only do what we are capable of doing and take our trade balance and repayment capability into consideration. In addition to continuing to invite direct investment by foreign firms, we must open up other ways, including obtaining funds directly from the international market, in order to gradually create a new situation of utilizing foreign funds through diversified channels.

We will adopt various forms to raise and repay the foreign funds we have absorbed. It is necessary for enterprises themselves to use commerical loans for abroad to build and manage projects capable fo earning foreign exchange and repaying foreign funds. To construct projects that lack the capacity to earn foreign exchange and repay foreign funds, we may use long-term, low-interest loans offered by international monetary organizations or on an intergovernmental basis, or link these projects with some auxiliary projects capable of earning foreign exchange for comprehensive development and management, thus maintaining a basic balance of absorbing and repaying foreign funds. We can also let the municipality make general plans for repaying foreign funds. Other projects can be developed and managed through public bidding by overseas investors in accordance with our planning and requirements. It is imperative to do a good job in preliminary feasibility studies for all projects using foreign capital.

To further attract foreign investors, we must consolidate, improve, and develop existing Chinese-foreign joint ventures, cooperative enterprises, and enterprises set up exclusively with foreign capital, and formulate and improve corresponding economic laws and regulations concerning foreign nationals. In accordance with the principle of equality and mutual benefit and stipulations of relevant laws, we should fully protect the legitimate rights and interests of Hong Kong and Macao compatriots, Overseas Chinese, and foreign traders who come to Shanghai to make investments and develop economic and technical cooperation.

Whether we can use more foreign capital or not is determined by our capacity to earn foreign exchange. According to the plan, the total value of Shanghai's exports in 1990 will be $4.3 billion. Of that total, the value of Shanghai products will be $ billion. The average annual growth will be 8.4 percent. The proportion of export commodities will increase from the current 30 percent to 40 percent of the total value of purchased commodities in Shanghai's domestic and foreign trade. This calls for our concerted efforts to make a breakthrough. It is necessary to strive hard to promote the production of marketable export commodities and further raise the quality and grade of export commodities. In terms of technology, variety, design, packaging, decoration, and advertising, it is necessary to make greater efforts to meet the demands of the international market. While making the most of exports of light and textile industrial products, we must also strive to increase the proportion of exports of machinery and electrical products and complete sets of equipment. We must strengthen the coordination between industry (agriculture) and foreign trade, technology and foreign trade, and import and export; actively disseminate experience and practice in this connection that have been proven to be effective; act in unison on exports; and promote joint management. It is necessary to consolidate and develop markets already available; actively open new markets; understand quotations on the international market in good time; do a good job in information feedback; adopt flexible measures to expand marketing channels; and establish and improve marketing and service systems so as to expand exports. It is necessary to seriously implement and perfect policies encouraging export so staff members and workers of foreign trade departments and plants producing export products can enjoy more preferential treatment. When a percentage of foreign exchange, which is earned from thorough processing of primary products supplied by fraternal provinces and cities, is retained in accordance with state stipulations, a rational proportion of this percentage must be returned to the fraternal provinces and cities.

While we are making efforts to expand commodity exports, we must also strive hard to develop tourism. Capital turnover in tourism is quick. Tourism also earns more foreign exchange while consuming less material resources. It does not contaminate the environment very much. In addition, it can spur the development of communications. light and textile industries, food industry, industrial art, and business and service trades; it also promotes friendly contacts among people of all countries. In this connection, Shanghai has a very large potential. Moreover, we should also coordinate with all fraternal provinces and cities to form a tourism network. During the Seventh 5-Year Plan, we will strive to increase the number of tourists visiting Shanghai from overseas by 150 percent over the Sixth 5-Year Plan, some 1.6 million people in 1990.

6. Actively Develop Lateral Economic Ties, Promote Codevelopment of the Economies of Shanghai and Other Localities

In the past several years, Shanghai has accumulated very rich experience in internal cooperation which has grown remarkably and produced marked economic results. However, we have not yet met the needs of economic development. During the Seventh 5-Year Plan, Shanghai should further develop lateral economic ties.

It is currently a good time to develop lateral economic ties. We must take the initiative to establish economic associations of all forms with a broader view, an open policy, and a positive attitude by adhering to the principles of exploiting advantages and avoiding setbacks, developing various forms, promoting mutual benefit, and achieving common progress. Our goal is to build integrated economic entities in the Shanghai Economic Zone, the Chang Jiang River Basin, and various localities throughout the country to manufacture products of famous brands, to develop scientific research work, to comprehensively utilize important natural resources, and to process export goods. Our aim is to organize groups of enterprises that cover various districts and departments and to continuously develop our economy which "fans out in two directions" in close connection with our efforts to promote economic and technical exchanges with foreign countries so as to create favorable conditions for transforming and rejuvenating Shanghai.

On the basis of the "Regulations of the State Council on Several Issues for Further Strengthening Lateral Economic Ties" and in close connection with the actual situation in Shanghai, we are working out measures to promote lateral economic ties in Shanghai. 1. Each year, we should use a part of the state investment in fixed assets to promote economic ties. We should simplify the procedure for checking and approving projects and give enterprises more decisionmaking powers while centralizing our guidance and working out a plan for strengthening lateral ties. 2. We should promote the lateral flow of funds. Various specialized banks should support economically integrated departments and enterprises with loans and charge them low interest rates for particular projects that promote economic ties. 3. In distributing products and supplying materials, we should give more decisionmaking powers to and make things convenient for enterprises that have established economic ties with others. 4. We should give preferential treatment to enterprises that have established economic ties with others and reaped profits from their economic associations or received remuneration from the transfer of technology or the offer of consulting services. Such treatment includes tax reduction or exemption. 5. We should give certain preferential treatment to enterprises that have established economic ties with others and retained a certain proportion of profits and to those that have set out to develop economic ties with other enterprises and have received remuneration in this connection. 6. We should adopt a more flexible policy in dealing with those who come to Shanghai from other localities to run enterprises so as to promote the production and circulation of commodities. We believe that as long as we unify our ideas, adopt a sound policy, coordinate with all the departments concerned, and vigorously forge ahead, we will definitely be able to quicken our pace in strengthening lateral economic ties in Shanghai and do a still better job in fulfilling our strategic tasks for the development of Shanghai's economy.

Here, I would like to stress one point. Shanghai is a city with emphasis on the processing industry. Various localities need Shanghai's support, but Shanghai needs the support of various localities even more. In order to achieve common prosperity, we must cordially receive people from various departments and units of fraternal provinces and cities; earnestly exchange views and humbly learn from them; and establish a long-term, stable, and fine relationship of economic cooperation with them on the basis of equality and mutual benefit.

7. Readjust Industrial Setups, Maintain Sustained, Steady and Coordinated Development of the National Economy

One of the important tasks in developing Shanghai's economy during the "Seventh 5-Year Plan" is to straighten out economic relations, readjust industrial setups, and bring about self-sustained economic growth as soon as possible.

In Shanghai's total setup of production, the current ratio of primary, secondary, and tertiary industries is 4 to 70 to 26 respectively. Over the past few years, tertiary industry has grown rapidly, but its proportion in the total setup remains low. It fails to keep pace with the development of primary and secondary industries and the needs of the people in raising their living standards. Therefore, to vigorously develop tertiary industry has become an urgent task. We must give top priority to developing tertiary industry. While trying to raise the absolute value of the primary and secondary industries, we must increase the proportion of tertiary industry from 26 percent in 1985 to 33.4 percent by 1-90 with an annual average growth rate of 13 percent so that the ratio of primary, secondary, and tertiary industries will be readjusted to 3.4 to 63.2 to 33.4.

The internal structure of these three industries shall be rationally readjusted as follows:

In primary industry, the principle of "stabilizing grain output, readjusting cotton crop, ensuring vegetable supply, and developing feed and marketable cash crops" has been adopted as far as crop cultivation is concerned. We should properly carry out grain production, increase forage output, and strive to promote the production of nonstaple foodstuff by increasing variety and improving quality so that peasants in suburban areas will be self-sufficient in grain while supplying most of the nonstaple foodstuff needed by urban residents. We should also set up multilevel and multiform service systems before, during, and after production. While readjusting the structure of agriculture, it is necessary to build water conservancy works and to accelerate the pace of farm mechanization. It is necessary to improve the management of state farms so that they can gradually become bases for domestic and foreign trade goods and for urban nonstaple foodstuff; models of agricultural modernization; and service centers for the rural economy. In order to supplement agriculture with industry, improve agricultural production conditions, continuously promote specialized, large-scale commodity production and modernize agriculture, we should attach great importance to the development of village and town enterprises, and based on the requirement for integrating urban and rural areas and guided by the plan for developing rural towns, we should develop village and town enterprises that produce supplementary equipment for major industrial sectors and are oriented to exports and agriculture, thereby enabling Shanghai's rural economy to advance in a more harmonious manner. It should be emphatically pointed out here that urban areas should step up their support for rural counties, especially those in outer suburbs, in various fields.

In secondary industry, readjustments should be made in line with the requirements set in the strategy for economic development, which calls for "four decreases and two increases" (that is, decreasing energy and material consumption, transportation volume, and the "three wastes" and increasing the intensity of technology and the added value). In view of the extensive scale, broad branches, strong coordination, and high economic efficiency of Shanghai industry, readjustment of its internal structure will mean a fairly difficult systems engineering project. We plan to make the readjustment in accordance with the following principles: First, in order to build up our ability to earn more foreign exchange through exports, we should reduce exports of outdated, low-grade, competitive commodities in various designs for export. Second, in order to enrich the people's livelihood and enliven the market, it is necessary to develop medium-, high-grade and famous brand quality light and textile industrial products and durable consumer goods and cut down on the production of low-grade and coarsely finished products in general. Third, in order to supply advanced technological equipment and new materials to other parts of the country, it is necessary to develop new, highly efficient, and computerized electrical and mechanical engineering products and set up new raw and semifinished materials industries and other trades while cutting down on the production of low technology, heavy-duty products for general use. Fourth, in order to lessen the burden on urban areas, reduce their reliance on raw and semifinished materials and energy, and protect the environment, we should develop small, exquisite, light-weight, and energy-efficient products with a higher added value and decrease the production of energy-inefficient and low value products by cooperating with inland areas in step-by-step relocating the production of goods that consume a lot of energy and materials to areas where raw and semifinished materials originate. Fifth, instead of concentrating on economic cooperation within the municipality, we should encourage cooperation among key enterprises and major trades in the Shanghai Economic Zone and the whole country as well and set up enterprise corporations with coordination among specialized departments. We shall carry out investigation and study and map out an overall plan for readjusting the industrial structure in a planned and systematic way so that Shanghai's industry will be gradually transformed from an extensive to an intensive type and from relying mainly on material supply to relying on technological progress during the Seventh 5-Year Plan.

In tertiary industry, we shall focus attention on developing transport, posts, telecommunications, commercial services, banking, and insurance business, and appropriately promote tourism, housing and real estate, information services, and consultancy. In commercial services, the total retail sales in the municipality in 1990 shall be increased by 44.7 percent over that of 1985, averaging an annual increase of 7.7 percent. Hence, it is necessary to further relax policies; expedite circulation channels; bring into fuller play the leading role of state-run commerce; pay greater attention to developing collectively and individually run commerce; increase the supply of staple and nonstaple foodstuff; and enrich the consumer market. The number of commercial outlets in the entire municipality shall be increased from 106,000 in 1985 to over 125,000 in 1990. It is necessary to promote the supply of small commodities and energetically promote catering, service, and repair trades in order to solve practical problems in the people's everyday life.

8. Raising People's Living Standards, Developing Social Security Work

On the basis of developing production and increasing labor productivity, we should constantly raise the people's material and cultural level. This is the basic starting point for the Seventh 5-Year Plan for National Economic and Social Development. During this plan, the annual increase in the actual income of staff members and workers in the municipality is estimated at approximately 5 percent, the annual increase in the peasants' average net income will be about 7 percent, and the annual increase in the consumption level of urban and rural residents will be about 6 percent.

The improvement in people's housing conditions and living environment is a basic task in raising the people's standard of living. We plan to build new houses in towns and other urban areas, with a total areas of 22 million square meters, and will strive to build more houses if the situation permits. At the same time, we shall pay attention to the building of various facilities for the new housing areas, and improving the environment and quality of life. We shall build a number of "new urban areas" with convenient communications, good facilities, rich and varied cultural life, and a beautiful environment on the borders of old urban areas.

During the Seventh 5-Year Plan, we shall continue to grasp family planning work, vigorously advocate eugenics, promote sound child-rearing practices and raise the quality of the population. We shall contain the annual natural growth rate of population at about 0.6 percent. In addition, we should strictly control the mechanical [ji xie 2623 2750] growth of the population, especially in key urban areas. We should further develop medical and public health work and strengthen the building of health care facilities. We should also strengthen our work in the prevention of disease, raise the quality of medical care, reduce the incidence of disease, and improve the people's health.

During the Seventh 5-Year Plan, the proportion of old people in the municipality will increase, so we must continue to mobilize and rely on all forces in society to provide care for the aged and show concern for their material and spiritual life. In the meantime, we should show concern for the life of disabled people and their study and work. We should improve and develop social welfare undertakings and give preferential treatment to families of servicemen and revolutionary martyrs. We should gradually establish, and perfect, a social security system.

III. On Reform of the Economic Structure

The Seventh 5-Year Plan is a key period, in which our country's economic structure will change from the old to the new model. Continuing and deepening systematic reform of the economic structure will be an important guarantee for implementing Shanghai's economic development strategy and fulfilling the Seventh 5-Year Plan.

During the Seventh 5-Year Plan, the goals of reform of the economic structure in Shanghai are as follows:

1. It is to firmly implement the decision and regulations of the party Central Committee and the State Council on expanding the power of enterprises to make decisions and further invigorate enterprises, especially large and medium-sized state enterprises.

2. It is to further expand the socialist commodity economy, strengthen the circulation of goods in key urban areas, and gradually improve the market system.

3. It is to strengthen and improve means of regulating economic operations, pay attention to the macroeconomic control system and shift state control of enterprises from direct to indirect means.

4. It is to promote lateral economic associations between different regions, departments, and trades to meet the need of production and circulation.

5. It is to actively create conditions for gradually improving administrative organizations, rules, and regulations inorder to cope with the new system.

In order to realize the above-mentioned goals, generally complete the change from the old to the new economic system and put Shanghai's urban economic structure onto the new track, we must effectively carry out the following work:

1. Further Invigorating Enterprises, Especially Large and Medium-Sized State Enterprises

Enterprises must truly become relatively independent economic entities, socialist commodity manufacturers and dealers with full authority for their own management and full responsibility for their own profits and losses. Except for a handful of enterprises, the overwhelming majority should have assumed responsibility for their own profits and losses by the end of the Seventh 5-Year Plan. It is necessary to continue to implement the various regulations of the State Council and the municipal government regarding expanding enterprises' decision-making power. Management departments at all levels must delegate more power regarding production and dealership to enterprises, guide them in the exercise of such powers, and render them better service. To constantly enhance the enterprises' capability in accumulation, transformation, and development, it is essential to systematically reduce the enterprises' regulatory tax and raise the depreciation rate for the fixed assets of some trades in accordance with state regulations. In the light of unified arrangements by the State Council, we must also gradually reform the enterprises' wage system, perfect the director (or manager) responsibility system, institute multifarious forms of economic responsibility systems, actively enhance the modern management level of enterprises, cut down the enterprises' number of administrative tiers, and through experiment, gradually reform the structure of companies of an administrative nature. We must further bring into play the active role of the collective economy in the national economy. We must also carry on reform of small state enterprises by turning them into collective enterprises, vigorously develop the collective economy, guide and develop the individual and other forms of economy.

An important aspect in the reform of the economic structure is to develop lateral economic ties. Hence, it is necessary to vigorously promote various forms of lateral economic association between enterprises, and break the numerous barriers characterizing the old economic system, in order to accelerate reform of the entire economic system and advance progress to socialist modernization.

2. Further Expanding the Socialist Commodity Market and Gradually Improving the Market System

We must continue to improve the wholesale system, properly run wholesale companies and trade centers, and establish the Shanghai Trading Information Center and several multipurpose large wholesale markets. We must also develop new modes of commerce, coordinating industry and commerce, agriculture and commerce, commerce and trade, agriculture, industry, and commerce. Through improving management and operation of the trade centers and exchange markets, we should strive to improve the marketability of commodities, regulare supply and demand, exchange information, promote circulation, and perfect their service. While gradually reducing the variaties and quantities of materials under unified state allocation and distribution, we must ensure supply of the principal materials required under mandatory planning. Under guidance and management of the people's banks in the municipality, we must fully bring into play the role of the Shanghai branches of the various specialized banks, make efforts to properly run the Bank of Communications, appropriately expand powers for the grassroots financial institutions, develop more channels and modes of financial credit, encourage borrowing between banks in a planned way, experiment with the issuance of debentures and stocks, open more channels for enterprises in raising funds, enhance the efficient utilization of funds, and gradually bring about the formation of a financial market. Simultaneously, we must broaden and activate the technology market, consumer goods' markets, the means of production, finance, technology, and real estate in order that a socialist market can take shape. Pricing reform during the Seventh 5-Year Plan should be carried out in accordance with the State Council's unified arrangements in a planned and systematic way. A number of measures must be taken to mitigate the influence of price adjustments in raw and semifinished materials. And to ensure general price stability of the market.

3. Instituting a New Macroeconomic Management System

During the Seventh 5-Year Plan, we should comprehensively implement the measures to strengthen macroeconomic control as the party Central Committee and the State Council have instructed. Economic operations should be controlled and regulated by gradually improved economic and legal measures, supplemented by necessary administrative means. The mainly direct control should gradually be changed to a mainly indirect control. We should further reform the planning system, reduce the proportion of mandatory planning, pay attention to economic information and economic forecast, carry out macroeconomic control and regulation through the financial, banking and tax departments, and gradually shift the stress of planning work to managing the economy mainly with economic policies and economic levers. We should improve local economic legislation and adjudication, establish and imrpove government economic legal institutions, and strengthen institutions of economic inspection and supervision. We should readjust government economic management organization, reduce levels, simplify administrative procedures, and separate government functions from enterprise management.

In order to accomplish reform in the economic structure, it is necessary for us to enhance our understanding of that reform.

We should enhance our understanding and put reform above all else. During the Seventh 5-Year Plan, reform of the economic structure is a very arduous task. Cadres at all levels should seriously study important party and government documents concerning reform, thoroughly understand the characteristics, objectives, orientation, tasks, and relevant policies of economic structural reform, unify their thinking and enhance their understanding. We should soberly understand Shanghai's role in China, live up to the expectations placed on the municipality by the party Central Committee and the State Council, and truly put reform above all else. We should display a courage to pioneer and introduce new ideas, assume a scientific attitude of seeking truth from facts, adhere to the principle of establishment before abolition, constantly further reform, and strive to march in the front row with our peers.

We should consolidate our confidence and correctly understand the complexity and arduousness of the reform. Currently, we are in the process of substituting a new structure for the old. While a considerable part of the old structure is still functioning, the new has begun to work. As a result, frictions and contradictions often exist between the two structures. The period of overlap of the two structures will not be very short. However, we should not let equilibrium between the two structures drag on too long, otherwise, both our reform and our construction will be adversely affected. Because the old structure is still playing a big role, our present reform task is even more arduous. Psychologically, we should be fully prepared. During the transition from the old structure to the new, there will be contradictions, and naturally there will be different views or even arguments over matters concerning the reform. We should not let a little problems in our work shake our confidence in reform. We should carefully plan and guide the reform, solve problems in our work in good time, and make the new structure hold a leading position as soon as possible.

We should adapt our thinking to a planned commodity economy as soon as possible. Shanghai is an old industrial base with a processing industry and state enterprises holding a dominant position. After a long period of direct government management of the economy, we have become accustomed to a system of mandatory planning, under which the state assigns tasks, supplies raw and processed materials, and monopolizes the marketing of products. The new situation created by the comprehensive reform is demanding of our cadres at all levels to change old patterns and outmoded ideas, and learn as soon as possible how to conscientiously use the law of value and the market mechanism to enhance the ability of enterprises to deal with the changing market situation, in competition and in self-transformation. It also demands of us to learn how to use economic and legal measures to regulate economic activities in society through various economic organizations, and to improve our skills in indirect management.

In short, our reform task during the Seventh 5-Year Plan is very arduous. We must sum up experience in the course of practice, carefully consider the present and the future, do meticulous work, and soundly promote reform.

During the Seventh 5-Year Plan, we must build socialism in both material and spiritual aspects, meaning a prerequisite of, and a supplement to, each other. Stressing the need to build "two civilizations" simultaneously, we must pay close attention to building spiritual civilization. It is necessary to intensify ideological and political work in accordance with the tasks and demands of the new period, and regularly conduct education among the masses of cadres and people in ideals, morality, general knowledge, and discipline, as well as in the situation and policies. It is necessary to further launch the "five stresses, four beauties, and three ardent loves" activities, and encourage the spirit of working hard for the modernization and revitalization of the Chinese nation, in order to resist and oppose the inroads of decadent bourgeois and feudalistic ideas. It is necessary to continue to stress the principle of material incentive while striking at ideas and acts of seeking private gain at public expense and "putting money above anything else." Special efforts should be made to closely coordinate school, family, and community in intensifying ideological education among youngsters to ensure healthy growth of the younger generation. It is necessary to deepen the activities for "civilized residents, units, and cities," step up education in professional ethics among all trades and professions, adn build the "ten major civilized windows" by improving service quality and attitude, treating others with courtesy, respecting the old, assisting the young, readily helping others, keeping public places clean, and observing traffic regulations, thereby building Shanghai into a civilized socialist city.

Departments engaged in teh study of social sciences should conduct in-depth and systematic study on major theoretical and policy questions regarding social development and reform, and strive to complete a number of quality projects and offer good advice to governments at various levels.

As culture is an integral part of socialist spiritual civilization, we should energetically develop and nurture various cultural undertakings during the Seventh 5-Year Plan in order to enrich the people's spiritual life and raise their intellectual and moral standards. In newspaper publication, it is necessary to improve the quality of newspapers and accelerate the construction of business buildings for the three newspapers. It is also necessary to pay attention to the social benefits of publication work, speed up the technological transformation of printing enterprises, and expand their printing capacity and quality. We should enrich radio and TV programs, improve their quality, increase broadcasting hours, and shoot more TV films reflecting the characteristics of the times and providing inspiration for the people. We should also encourage literary and artistic creation, build more stages for literary and artistic performances, and improve their quality. In stepping up construction of cultural facilities, it is necessary to build and renovate a few movie houses and theaters, raise funds to build culture and arts centers, facilitate construction of the new building for the Shanghai Library, and improve the management of museums, archives, and other cultural establishments. We should extensively unfold mass physical culture activities, build up the people's physical strength, and vigorously train good coaches and athletes in order to win more victories in competition at home and abroad.

It is necessary to give further expression to socialist democracy and improve the socialist legal system. Efforts should be made to popularize legal knowledge and enhance legal sense among the municipality's residents within the next 5 years. It is necessary to mobilize and rely on various quarters to take concerted action to improve public order, deal firm blows at serious economic crime and criminal offenses, and check and prohibit all improper activities corrupting general social conduct. It is also necessary to further implement the responsibility system in public security, educate, help, and transform criminals with minor offences, and do everything possible to further stabilize society. We are convinced that, by relying on the broad masses of people under the leadership of the municipal party committee, we shall definitely be able to achieve a fundamental improvement in prevailing social conduct and create a good social environment for transforming and revitalizing Shanghai.

Deputies:

The implementation of the Seventh 5-Year Plan is a glorious and yet arduous task, and we feel deeply that we have a heavy responsibility. In order to live up to the trust placed in us by the Shanghai people, we shall firmly improve government organizations at all levels, and seriously pay attention to the following three tasks:

We shall reform the administrative organization. The municipal government will be reformed in accordance with a principle of separating government functions from business management, simplifying administration and decentralization, and the indirect management of enterprises. It will gradually readjust its organization, strengthen multifunction departments, disorganize or merge overlapped organizations, reduce management levels, and streamline temporary agencies. It will strengthen its leadership over district and county governments, improve and readjust district and county governmental organizations, and make district and county governments play a greater role in urban construction and management, the building of spiritual civilization, management of the collective and individual economy, and development of tertiary industry. We shall strengthen the basic level administration of neighborhoods, townships, and towns, particularly the offices of neighborhoods newly-added to urban districts, in order to gradually establish a more reasonable and highly efficient urban government management system.

We shall improve our leading methods. We are in a period of great change caused by reforms and opening to the outside world. Leading cadres at all levels and all staff members should conscientiously adapt themselves to the changes, study basic Marxist theories hard, gain economic and specialized knowledge, go among the masses at the grassroots units, pay attention to investigation and study, and improve our ability to make decisions scientifically and to deal with problems. We should know that the management of a modern city, especially a big city like Shanghai, is very complex systems engineering, and the leaders' knowledge and experience alone are not enough for the job. In addition to continuing to rely on government departments, we should bring into play the role of the research and consultancy departments in solving major problems. We should solicit opinions from all quarters, pool the wisdom of the masses, compare all options before making a final decision, and raise the scientific level and feasibility of the decision. Government economic management departments should gradually change their working methods. They should no longer devote their energy to assigning quotas, approving construction projects, allotting funds and materials. Instead, they should carry out overall planning, implement policies, organize coordination, provide services, use economic means of regulation, and exercise effective inspection and supervision.

We shall improve our workstyle. The behavior and workstyle of government functionaries have a direct bearing on the image of the government in the eyes of the people. In order to improve our workstyle, we should pay attention to three things. First, we should strengthen unified leadership. On the basis of fully displaying democracy, we should know how to practice centralism and make resolute decisions. Decisions must be implemented and no one should go his own way. Important projects must be firmly carried out to the end. We must coordinate all concerned and solve problems in good time to ensure completion of the projects on schedule. Second, we should improve working efficiency. Government departments at all levels should establish a clear and definite system of responsibility, perform their duties, strengthen lateral ties among themselves, coordinate work on their own accord, and correct the workstyle of wrangling and being dilatory in doing things. We should improve our practice at meetings. A work meeting must be attended by representatives of the organizations concerned, so that it can make definite and feasible decisions. We should reduce meetings and documents to give cadres at all levels more time to go deep into the realities of life to solve problems. Third, it is necessary to encourage the spirit of doing solid work and renouncing empty talk in favor of practical work. Government departments at various levels should make arrangements for their work and inspect it, and they should "keep their promises and take resolute action." This year, the municipal government should carry out 15 practical tasks having a close bearing on the people's daily life, and it should make it a practice to carry out similar tasks every year in the future. Government functionaries should bear firmly in mind the purpose of serving the people wholeheartedly, be modest and prudent, and be honest and devoted to their official duties; they should not abuse their powers to seek personal gain; and they should forge close ties with the masses, continue to improve their workstyle, play an exemplary role, and be a public servant trusted by the masses of people. We warmly welcome you deputies and people in the municipality to supervise, criticize, and help with the work of the municipal government.

Deputies, the Seventh 5-Year Plan shows a grand, beautiful future for us. At the same time, we should fully realize that our tasks are arduous. Because the financial and material resources we can use during the Seventh 5-Year Plan are limited, many long-standing problems cannot be solved overnight. Solving such problems will call for a long, hard struggle by people throughout the municipality. We believe that under the correct leadership and kind attention of the party Central Committee and the State Council, and under the direct leadership of the municipal party committee, we can certainly successfully carry out the Seventh 5-Year Plan through the arduous efforts and heroic struggle of Shanghai's workers, peasants, intellectuals, cadres, members of the PLA, and security policemen with a glorious revolutionary tradition, through the unity and concerted efforts of democratic parties, various nationalities, and personages who aredently love the socialist motherland, and with Shanghai's favorable conditions as an open city and the vigorous support of various fraternal provinces and municipalities. In so doing, we shall lay a solid foundation for making Shanghai an open, multifunctional, modern socialist city with a rational structure of industrial production, advanced science and technology, and a high degree of civilization by the end of this century.

ANHUI PEOPLE'S CONGRESS SESSION ENDS

OW200545 Hefei ANHUI RIBAO in Chinese 29 Apr 86 p 1

[Excerpts] After successfully completing all scheduled tasks, the Fourth Session of the Sixth Anhui Provincial People's Congress came to a triumphant conclusion at Jianghuai Grand Theater on the morning of 28 April.

The session called on workers, peasants, intellectuals, and cadres, as well as PLA commanders and fighters; judicial, procuratorial, and public security cadres and police; and all democratic parties, people's mass organizations, and patriots to work with one heart and one mind, display the spirit of the foolish old man who moved the mountain, and strive for the fulfillment of the tasks for this year and the gigantic Seventh 5-Year Plan under the leadership of the CPC Central Committee, the State Council, and the Anhui Provincial CPC Committee.

The executive chairmen of the sessions were Huang Huang, Wang Guangyu, Su Yu, Su Hua, Zhang Zuoyin, Wei Xinyi, Xia Deyi, Zheng Rui, Yang Chengzong, Zhao Minxue, Ying Yiquan, Kang Zhijie, Du Weiyou, Zheng Huaizhou, and Hu Xiangnong.

The session adopted a resolution on Anhuis Seventh 5-Year Plan and the report on the plan and decided to approve Governor Wang Yuzhao's report "Persist in Reform, Realize the Splendid plan, and Strive To Fulfill Anhui's Seventh 5-Year Plan" made on behalf of the provincial people's government and to approve in principle the "Seventh 5-Year Plan for Anhui's Economic and Social Development" formulated by the provincial people's government.

The session also adopted resolutions on Anhui's 1986 plan for economic and social development; on Anhui's 1985 final accounts and 1986 budget, on the report on the work of the provincial people's Congress Standing Committee; on the report on the work of the provincial Higher People's Court; and on the report on the work of the provincial People's Procuratorate.

The session approved requests by Zhang Zuoyin to resign from the post of vice chairman and by Tian Lei and Li Jixiang to resign as members of the sixth provincial People's Congress Standing Committee. The deputies accordec Zhang Zuoyin, Tian Lei, and Li Jixiang warm applause to thank them for their meritorious services to the sixth provincial People's Congress Standing Committee.

The session approved the "election rules" and a namelist of general scrutineer and scrutineers. Through secret ballot in a by-election, the session elected Chen Tingyuan [7115 1656 0337] as vice chairman and Shi Yuansheng [0670 0337 3932], Li Dajing [2621 1129 4842], Zhou Zhenjiang [0719 2182 1730], and Wei Fuifeng [7614 3843 1496] as members of the sixth Provincial People's Congress Standing Committee. The session also elected Tai Baozhou [6733 0203 3166] and Wang Zhicai [3769 2784 2088] as chief procurators respectively of the Chuxian and Chaohu branches of the provincial People's Procuratorate and Yao Heting [1202 7729 0080] as president of the Anqing Prefectural Intermediate People's Court.

Seated on the rostrum were, in addition to members of the session presidium, the governor and vice governos of the provincial people's government, the president of the provincial higher people's court, and the chief procurator of the provincial people's procuratorate, as well as veteran Comrades Huang Yan, Li Shinnong, and Zhang Kaifan.

Some NPC deputies from Anhui attended the session as observers. Also attending the session as observers were other officials of the provincial people's government and responsible persons of departments subordinated to the central authorities, organs directly under the provincial government, and colleges and universities in Hefei.

The session closed victoriously amidst the majestic national anthem.

HEBEI: SIXTH PROVINCIAL PEOPLE'S CONGRESS ENDS

SK200817 Shijiazhuang HEBEI RIBAO in Chinese 5 May 86 p 1

[Excerpts] The 10-day fourth session of the Sixth Provincial People's Congress was successfully concluded this afternoon after fulfilling all its scheduled tasks.

The executive members of the congress presidium served as the executive chairmen of the closing ceremony of the congress session. They were Sun Guozhi, Wu Qingcheng, Guo Zhi, Yue Zongtai, Zhang Zhenchuan, Pan Chengxiao, Liu Ying, Wang Yu, Han Qimin, Wang Youhui, and Li Tie.

Seated on the rostrum were Xing Congzhi, Xie Feng, Yang Zejiang and Yin Zhe, as well as the executive chairmen of the congress, and other members of the congress presidium.

Also seated on the rostrum were responsible comrades of the provincial CPC committee, including Li Wenshan, Zhang Chao, Ye Liansong, Lu Chuanzan, Qu Weizhen, Bai Shi, and Chen Yujie, and responsible comrades of the provincial government, the provincial CPPCC committee, the provincial military district, the various democratic parties, the provincial higher people's court, and the provincial people's procuratorate, including Wang Zuwu, Hong Yi, Zhang Runshen, Li Feng, Xu Chunxing, Bai Tieshi, Chen Lintang, Ma Zhuozhou, Wang Enduo, Ma Xinyun, Liu Zongyao, Du Jingyi, Dong Xuelin, Zhang Pingdong, Liu Zhiqi, Yang Naijun, Liu Zhenhua, Zhu Zeji, and Yu Zhenzhong.

Also seated on the rostrum were Wang Zheng, Zeng Mei, Niu Shucai, Hu Kaiming, Cao Youmin, Ge Qi, Ding Tingxin, Zhao Zhuoyun, Zhao Zhenzhong, Zhou Xueao, and Lu Zhiguo.

The session pointed out that the guidelines, principal tasks and work plans defined in the Seventh 5-Year Plan are correct and the stipulated fighting objective is feasible, and that it is possible to realize them through common efforts of the people throughout the province. It also pointed out that the guidelines, objective, and plans accord with the demands of realizing the grand goal by the end of this century.

At the fifth plenary meeting of the fourth session of the Sixth Provincial People's Congress held this morning, deputies elected Xie Feng governor of the provincial People's Government, and some members of the Standing

Committee were elected to people's congress through by-elections and secret vote.

The results of the by-elections were first announced at the closing ceremony held this afternoon. The session then adopted in success [word indistinct] resolution on the report of the Hebei Provincial "Seventh 5-Year" Plan; a resolution on the report of the draft 1986 Hebei Provincial economic and social development plan; a resolution on the report of the 1985 Hebei Provincial financial account and of the 1986 draft financial budget; regulations on popularizing compulsory education in Hebei Province; a resolution on the work report of the Hebei Provincial People's Congress Standing Committee; a resolution on the work report of the provincial Higher People's Court; and a resolution on the work report of the provincial People's Procuratorate. The congress session came to an end amid the grand playing of the national anthem.

The executive chairman of this morning's session were Han Qimin, Zhang Zhenchuan, Wang Wanchun, Zhang Chunfu, Yang Xiangrong, and Cao Xi.

REPORTAGE ON XIZANG PEOPLE'S CONGRESS SESSION

Preparatory Meeting Held

HK200207 Lhasa Xizang Regional Service in Mandarin 1130 GMT 19 May 86

[Excerpts] A preparatory meeting for the fourth session of the Fourth Xizang Regional People's Congress was held in the Lhasa Theater this morning. The meeting announced that the preparatory work for the session has been completed, and the session will open on 20 May. Pagbalha Geleg Namgya, vice chairman of the Regional People's Congress Standing Committee, presided at the meeting.

The session agenda will be as follows: 1) To hear and discuss a regional government report on the draft of the region's Seventh 5-Year Plan for national economic and social development, and to examine and approve this plan; 2) to hear and discuss a report of the regional economic and planning commission on the draft plan for the region's national economic and social development in 1986, and to examine and approve this plan; 3) to hear and discuss a report of the regional finance department on the final accounts for 1985 and the draft budget for 1986, and to examine and approve the final accounts and the budget; 4) to hear and discuss the work report of the regional People's Congress Standing Committee; 5) to hear and discuss the work report of the regional Higher People's Court; 6) to hear and discuss the work report of the regional People's Procuratorate; 7) appointments and dismissals; 8) other.

People's Congress Session Opens

HK210249 Lhasa Xizang Regional Service in Mandarin 1130 GMT 20 May 86

[Excerpts] The fourth session of the Fourth Xizang Regional People's Congress opened in Lhasa today. Pagbalha Geleg Namgya presided at the opening ceremony. Present were responsible comrades of the party, government, and army in the region including Raidi, Basang, Mao Rubai, and Puqung.

Doje Cering, acting-chairman of the regional People's Government, delivered a report on the region's Seventh 5-Year Plan. The report was in three parts: 1) the execution of the Sixth 5-Year Plan; 2) the basic tasks and focal points for the Seventh 5-Year Plan; 3) the main policies and measures for accomplishing the Seventh 5-Year Plan.

In the first part of the report, he reviewed the region's great achievements during the Sixth 5-Year Plan. He announced that the main targets of the plan were basically completed. The national economy developed, and progress was made in all undertakings. There was a marked improvement in the living standards of the peasants and herdsmen, and some of them started to get rich. Socialist nationality relations of equality, solidarity, and mutual assistance continually developed. The present is the best political and economic period in Xizang since its peaceful liberation.

In the second part of his report, Doje Cering said that by 1990 the region's total industrial and agricultural output value should reach 1.2 billion yuan and gross domestic product should reach 1.49 billion yuan, which are respectively 34.8 percent and 33 percent higher than the 1985 figures. The basic tasks during the Seventh 5-Year Plan are as follows:

1. Carry out deepgoing and systematic reform of the economic structure, and further harmonize the various relationships. We must strengthen our own vitality, improve economic results, and make good progress in accomplishing the two switches. During the period of the plan, we should basically bring the region's economy into an open-style and operational-type track.

2. We should vigorously develop commodity economy centered on the basic task of eliminating poverty and enriching the people, and bring about a relatively big improvement in the masses' living standards. Average peasant and herdsman income by 1990 should reach 500 yuan.

3. Open up more sources of increasing revenue and strive for a turn for the better in the financial situation. We should eliminate our deficits.

4. We must make the greatest efforts to step up key construction work, technological transformation, and exploitation of brain-power. We should prepare the necessary material, technological, and talent reserves for continued economic and social development in the region in the 1990's.

We must focus on the following seven tasks in order to attain the goals and task of the Seventh 5-Year Plan: 1) Seriously grasp agriculture and animal husbandry, the foundation, 2) Make the greatest efforts to improve education. 3) Strengthen the construction of energy, communications, and telecommunications. 4) Vigorously develop tourism. 5) Further develop external economic and trade ties. 6) Actively develop nationality handicrafts and the processing industries. 7) Actively develop ming.

In the third part of his report, Doje Cering proposed seven major policies and measures for accomplishing the Seventh 5-Year Plan: 1) We must continually straighten out the guiding ideas on economic work. 2) We must carryout deepgoing and systematic reform of the economic structure. 3) We must persevere in opening up to the world. 4) We must tap more sources of increasing financial revenue. 5) Attach importance to capital construction and strengthen management over it. 6) Build the two civilizations simultaneously. 7) Improve work style.

Doje Cering Reviews Sixth 5-Year Plan

HK220423 Lhasa Xizang Regional Service in Mandarin 1130 GMT 21 May 86

[Excerpts] In his report to the fourth session of the Fourth Regional People's Congress, Regional Government Acting Chairman Doje Cering said: The 5 years of the Sixth 5-Year Plan were a period of claring away leftist influence, bringing order out of chaos, and gaining a fresh and deeper understanding of Xizang.

He said: The region's total industrial and agricultural output value in 1985 amounted to 100.45 percent of the Sixth 5-Year Plan target and showed an increase of 27.4 percent over 1980, having risen at an annual rate of 4.9 percent. Agriculture and animal husbandry production revived and developed amid reform and readjustment during the 5 years. Industrial and communications production made some progress amid reform and fulfilled the Sixth 5-Year Plan targets. In particular, nationality handicrafts focused on collective and individual operations have revived and developed relatively rapidly in recent years.

There has been a great improvement in the basic conditions of communications and transport. The transport tasks were fulfilled relatively well. Construction of rural roads and bridges developed somewhat. Collective and individual transport undertakings developed rapidly. Total motor vehicle freight transportation amounted to 131 percent of the plan. Preparations for the establishment of the Xizang Aviation Company are now underway.

The region scored notable success in capital construction and technological transformation during the 5 years. Investment completed in fixed assets amounted to 80 percent more than during the Fifth 5-Year Plan.

New developments have occurred in the region's external economic relations and trade. Tourism is gradually developing, and tourist facilities have now formed on an initial scale.

Expenditure on education during the Sixth 5-Year Plan increased by 170 percent compared with the previous 5-year plan. Initial readjustments have been carried out in education.

The party's policy on freedom of religious belief has been further implemented, and the masses' legitimate religious activities have been respected and protected.

The party and government have made positive efforts to improve the people's living standards, which have risen markedly. This is mainly shown in the following ways: 1) The income of the masses in the agricultural and pastroal areas has increased relatively rapidly. The wages of workers in units owned by the whole people increased at an annual rate of 22 percent during the period of the plan. 2) There has been a marked increase in urban and rural consumption level, and changes are occurring in the consumption pattern. 3) Housing conditions have improved. 4) There has been a big increase in urban and rural savings deposits. 5) There has been relatively great development of urban public utilities.

Doje Cering Reports on Seventh 5-Year Plan

HK230205 Lhasa Xizang Regional Service in Mandarin 1130 GMT 22 May 86

[Excerpts] Acting Regional Government Chairman Doje Cering said in his report at the fourth session of the Fourth Regional People's Congress that the Seventh 5-Year Plan is a key period in carrying out reform of the economic structure, bringing about the two switches, putting the economy gradually onto the track of self-development and into a benignant cycle, and laying the foundation for the enrichment of the masses. He said: The basic tasks for the Seventh 5-Year Plan are as follows:

1. Carry out deepgoing and systematic reform of the economic structure, further harmonize relationships in all respects, increase self-vitality, and improve economic results. We should take a relatively great stride forward in bringing about the two switches.

2. Vigorously develop commodity economy centered on eliminating poverty and enriching the masses, and bring about a relatively great improvement in their living standards.

3. Open up more sources for increasing revenue, strive for a turn for the better in the financial situation, and eliminate deficits.

4. Do everything possible to step up key construction work, technological transformation, and exploitation of brain-power. We should prepare the necessary material, technological, and talent reserves for the region's economic and social development in the 1990's.

He said: We must focus on a number of tasks during the Seventh 5-Year Plan:

1. Seriously grasp agriculture and animal husbandry, the foundation. During the period of the plan, we must continue to persevere in the principle of focusing on animal husbandry, integrating animal husbandry, agriculture, and forestry, diversifying in light of local conditions, and developing commodity production. The economy in the agricultural and pastoral areas should gradually become specialized and modernized commodity economy.

2. Do everything possible to make a success of running education well. We must vigorously step up basic education during the Seventh 5-Year Plan, improve the quality of education, and adopt a variety of forms of running schools. We must give priority to teacher training and improve the building of the teacher force. We must straighten out and improve tertiary education and specialized secondary education, gradually develop adult education, and gradually establish teaching in both Tibetan and Chinese languages.

3. Strengthen energy, communications, and telecommunications construction. We must map out plans for developing electric power throughout the region. In communications, we must continue to get a good grasp of road construction and speed up the construction of air transport. We must step up the building of modern telecommunications, with the focus on developing ground satellite stations. We must develop domestic and international telephone and facsimile communications, and improve postal services.

4. We must vigorously develop tourism.

5. Further develop foreign economic relations and trade. During the Seventh 5-Year Plan, we must focus on the cardinal links of production and procurement centered on increasing our ability to earn foreign exchange from exports. We must organize relatively ample resources of exports. We should set up a variety of export commodity bases and gradually from a relatively complete export production setup.

While upholding the principle of unified external dealings, we should further relax the policies and vigorously develop trade with neighboring countries and border trade.

6. We should actively develop nationality handicrafts and processing industries.

7. We must actively develop mining. In the next 5 years, we should gradually establish and put on a sound basis a local mining legal system, carry out geological prospecting in a planned way, and map out plans for exploiting and using resources. The government and the departments concerned should provide assistance and guidance in capital, technology, equipment, transport and sales.

Congress Hears Planning, Budget Reports

HK230207 Lhasa Xizang Regional Service in Mandarin 1130 GMT 22 May 86

[Text] The fourth session of the Fourth Xizang Regional People's Congress held its second full gathering on the afternoon of 22 May. (Xiang Yang), director of the regional Economic and Planning Commission, delivered a report on the draft 1986 national economic and social development plan for 1986. (Li Liangyan), deputy director of the regional finance department, reported on the final accounts for 1985 and the draft budget for 1986.

Director (Xiang Yang) said that the guiding idea in arranging this year's plan is to continue to implement the series of important central instructions on work in Xizang and the spirit of the enlarged meeting of the regional CPC Committee Standing Committee, base everything on Xizang realities, further eliminate leftist influence in economic work, continue to practice the principle of opening up to the world and invigorating the domestic economy, persevere in reform, and strengthem macroeconomic control. It is necessary to maintain a certain economic growth rate under the premise of improving economic results, which must be assigned an important strategic position. We should actively develop tourism and foreign trade. Other undertakings should develop correspondingly. Urban and rural living standards should be further improved on the basis of the development of production. We must also get a good grasp of building spiritual civilization.

(Li Liangyan) said in his report: In view of the region's actual financial state, the principle in arranging the budget for this year is to ensure the expenditure needs for the population, for normal undertakings, and for structural reform, cut expenditure on capital construction and on administration, support the masses in getting rich, and support the development of education and tourism.

PROVINCIAL AFFAIRS

REPORTAGE ON GUANGDONG PEOPLE'S CONGRESS SESSION

Luo Tian Declares Meeting Open

HK210349 Guangzhou Guangdong Provincial Service in Mandarin 0300 GMT 21 May 86

[Excerpts] The fifth session of the Sixth Guangdong Provincial People's Congress opened in the Zhongshan Memorial Hall this morning, attended by 986 people's deputies. The executive chairmen today were Luo Tian, Lin Ruo, Ren Zhongyi, Li Jianzhen, Liu Tianfu, Liang Lingguang, Wang Ning, Wu Nansheng, Zhang Juhui, Xue Yan, Yi Meihou, (Guo Yixin), (Liao Buru), (Yang Wengui), and (Zhong Yaokui). Luo Tian, chairman of the provincial People's Congress Standing Committee, declared the session open at 0900. Governor Ye Xuanping delivered a report on the draft of the province's Seventh 5-Year Plan for national economic and social development.

He first reviewed and affirmed the achievements of the province during the Sixth 5-Year Plan in persevering in reform and opening up to the world. He continued [begin recording]: By 1990, the province will have formed a considerable industrial and agricultural production capacity with a relatively rational pattern. The open zones will further play their role as windows of technology, management, nowledge, and the open policy, and their external and internal radiation roles. There will be a marked improvement in the energy shortage as a result of the construction of a number of thermal power stations, and the linking up of the Guangdong and Guangxi power grids, plus the exploitation and use of natural gas and offshore oil. In air, waterway, railroad, and highway communications and in telecommunications, a network will be formed, centering on Guangzhou, linking up places inside and outside the province, Hong Kong, Macao, and foreign countries. A system of scientific research serving economic construction and of its popularization will be initially formed. The province will form in foreign economic relations and trade an export commodity setup with strong market competitiveness, good foreign exchange earnings capability, and Guangdong characteristics. The markets and tourism will become more flourishing. The province will enjoy good political stability and social order and mood. The people will be happy in their lives and business. Guangdong will enter a new period of economic invigoration. [end recording]

Governor Assesses Sixth 5-Year Plan

HK220849 Guangzhou Guangdong Provincial Service in Mandarin 0300 GMT 22 May 86

[Text] Governor Ye Xuanping said in his report at the fifth session of the Sixth Provincial People's Congress that most of the targets set for the Sixth 5-Year Plan were fulfilled or overfulfilled. The Sixth 5-Year Plan goes into the history book as the most prosperous in the province's history.

Ye Xuanping said: The province's economy achieved sustained and steady growth during the Sixth 5-Year Plan. Total industrial and agricultural output value in 1985 was 69.1 billion yuan, having risen at an annual rate of 13.6 percent during the 5 years. Gross social product, gross domestic product, and financial revenue all rose by an annual average of more than 13 percent. National income rose at an average annual rate of 11.7 percent. Such growth was higher than what the province recorded during the Fifth 5-Year Plan and also exceeded the national average. This was the fastest period of economic growth in the province since the founding of the state.

REPORTAGE ON HUNAN PEOPLE'S CONGRESS SESSION

Mao Zhiyong, Others Attend Opening

HK220315 Changsha Hunan Provincial Service in Mandarin 1000 GMT 21 May 86

[Excerpts] The fourth session of the Sixth Hunan Provincial People's Congress opened in Changsha today. The opening ceremony was attended by Mao Zhiyong, Xiong Qingquan, and other leading comrades of the party and government in the province. Executive Chairman Jiao Linyi declared the session open at 0900.

Governor Xiong Qingquan delivered a government work report to the session. The report was in four parts: 1) the main achievements during the Sixth 5-Year Plan; 2) the basic tasks and strategic focal points during the Seventh 5-Year Plan; 3) get a good grasp of this year's economic work; 4) vigorously step up the building of socialist spiritual civilization and the legal system.

Also present at the opening ceremony were responsible comrades of the provincial CPC Committee, advisory commission, discipline inspection commission, government, CPPCC, and military district including Liu Zheng, Liu Fusheng, Wan Da, Zhao Chuqi, Shi Xinshan, Chen Bangzhu, Wang Xiangtian, Cao Wenju, Yu Haichao, Yang Huiquan, Chen Xinling, Yin Changmin, Zhou Zheng, Tong Ying, Peng Mingbing, (Shi Jinhu), Jiang Jinliu, and Gu Shanqing.

The session held its second full gathering in the afternoon. (Wang Xiaofeng), director of the provincial planning commission, reported on the draft provincial economic and social development plan for 1986. (Xu Baoyuan), director of the provincial finance department, reported on the final accounts for 1985 and the draft budget for 1986.

(Wang Xiaofeng) said: As far as reforms are concerned, this year the province must concentrate on consolidation, digestion, replenishment, and improvement, and prepare for new strides in reform next year and the year after. In economic construction, we must continue to control investment in fixed assets and excessive growth in consumption funds. We must also strive to improve supplies, further invigorate the economy, and strive for a rough balance between social supply and demand, thus ensuring steady and coordinated development of the national economy.

(Wang Xiaofeng) said: The province's industrial and agricultural output value this year should raise by 7.5 percent over last year. He also reported on the specific tasks and main measures for this year.

(Xu Baoyuan) then reported on the final accounts for 1985 and the draft budget for 1986. He said: The province had a balanced budget in 1985 and also maintained the surplus level of the previous year. On the draft budget for 1986, he said: This year we must further perfect the fiscal and taxation reform measures, vigorously develop production, and further improve economic results. We must tap more sources of increasing revenue and ensure key construction work. We must focus on supporting the development of education and science, and appropriately increase investment in agriculture. On the basis of developing production and improving economic results, we should continue to improve living standards. We should maintain a balanced budget through strengthening comprehensive balance and fiscal controls, and achieve a slight surplus. He also reported on specific measures for achieving the tasks in this year's budget.

Governor Gives Government Work Report

HK230405 Changsha Hunan Provincial Service in Mandarin 0900 GMT 22 May 86

[Excerpts] In his government work report at the fourth session of the Sixth Provincial People's Congress, Hunan Governor Siong Qingquan first reviewed the province's main achievements during the Sixth 5-Year Plan.

He said: Most of the tasks and goals of the Sixth 5-Year Plan were fulfilled or overfulfilled. Gross domestic product rose at an annual average of 9.6 percent during the 5 years, while national income rose at an annual average of 813 percent. Industrial and agricultural output value rose at an annual average of 8.7 percent. Agricultural output value, including village-run industries, rose at an annual average of 8 percent. Industrial output value rose at an annual average of 9.3 percent. Local financial revenue, calculated according to comparable headings, rose at an annual average of 9.2 percent.

The province's grain output in 1985 was 25,143,000 tons, having risen at an annual average of 3.4 percent. Output of pork, beef, and mutton was 1,385,100 tons, having risen at an annual average of 8.4 percent. In 1985 Hunan ranked among the top five in the country in production of grain, pigs, tea, tobacco, jute, ambary hemp, ramie, and reshwater products.

The province's coal output in 1985 was 29.45 million tons, having risen at an annual average of 4.2 percent. Electric power generation was 14.75 billion kilowatt hours, having risen at an annual average of 4.4 percent. Steel output was 1.09 million tons, having risen at an annual average of 9.5 percent. The province ranked among the top five in the country in production of 10 nonferrous metals, chemical fertilizer, sulphuric acid, and cigarettes. We were among the 12 provinces and municipalities producing more than 1 million tons of steel a year.

The province made major progress in capital construction and technological transformation during the Sixth 5-Year Plan. New developments occurred in science and technology, education, culture, public health, and sports. Living standards in urban and rural areas showed notable improvement. Comparing 1985 with 1980, the average net income of the peasants rose from 220 yuan to 395 yuan, while the average cash earnings of urb an workers rose from 718 yuan to 1,109 yuan. Total urban and rural savings deposits at the end of 1985 were 5.011 million yuan, an increase of 340 percent over 1980.

Governor Xiong Qingquan also spoke on shortcomings and mistakes in work and on difficulties and problems on the way ahead. He said: After the party's work focus shifted to economic construction, we failed to carry out an intensive survey of the province's basic conditions, and our strategic ideas on economic development were not clear-cut enough. Not enough stress was placed on the strategic focal points. Although we could see that the shortage of electric power was a major factor constraining Hunan's economic development, we laid too much stress on the difficulties in solving this problem and failed to summon up sufficient resolve to concentrate efforts on electric power production.

Our support and service for agriculture in recent years has been ineffective. In particular, agricultural capital construction has been slackened somewhat. We have failed to take effective action in using our abundant agricultural and sideline production resources to speed up the development of the food and fodder industries and promote the township enterprises.

Governor Xiong Qingquan said: Although we have attached importance to assisting old revolution bases, minority-nationality areas, and remote and poor regions in developing production and solving the masses' livelihood difficulties, we have failed to do enough study of the actual problems there, and the policies and measures have not been sufficiently firmed up. While attaching importance to building material civilization, we have failed to get a sufficient grasp of building socialist spiritual civilization and the legal system. Certain factors of instability have appeared in our economic life amid our excellent economic situation. Supply of some materials has failed to meet demand. Prices rose too fast at one time. In capital construction, we have failed to strictly control construction projects not covered by the plan.

In improving and widening roads, although our point of departure was good and some successes were scored, due to failure to act according to capital construction procedures, to insist on scientific design and careful construction work, and to strictly enforce the laws and regulations on acquisition of land and demolition of houses, there was a rush into mass action, and in some cases compulsory orders were given which violated law and discipline and harmed the masses' interests. This is a profound lesson. The provincial government and the government at all levels have taken and are continuing to take steps to seriously solve this problem.

Governor Xiong Qingquan proposed the basic tasks and the major economic and social development targets for Hunan during the Seventh 5-Year Plan. He also gave views on questions related to achieving the main targets. He said: The basic tasks for the province during the Seventh 5-Year Plan are as follows:

1. Continue to promote all-round reform of the economic structure and basically lay the founation for a new-style socialist economic setup.

2. Maintain sustained and steady economic growth. Under the premise of controlling total investment in fixed assets, we should vigorously step up key construction work, technological transformation, and exploitation of brain-power, to strengthen our reserve force for economic and social development during the 1990's.

3. Continue to improve urban and rural living standards on the basis of developing production and raising economic results.

Governor Xiong said: In the course of 5 years of hard work, we should strive to catch up with and surpass the national averages in economic and social development targets, and ensure synchronous growth of industrial and agricultural output value, national income, and financial revenue. Calculated by 1985 prices, gross domestic product should rise by an annual average of 8.5 percent and national income by an annual average of 8 percent up to 1990. Calculated by 1980 prices, industrial and agricultural output value should rise by an annual average of 7.7 percent. We should strive to achieve the first doubling by 1989. The average net peasant income should rise at an annual average of 7 percent, while workers' wages should rise at an annual average of 5.2 percent during the 5 years. The total urban and rural consumption level should rise by an annual average of 5 percent.

Governor Xiong Qingquan stressed: The merit for the economic achievements of the Sixth 5-Year Plan should be ascribed to reform. We must continue to depend on reform to fulfill the Seventh 5-Year Plan. Reform is the primary task of the plan period. There are three main contents of the province's economic structural reform during the Seventh 5-Year Plan: 1) Further invigorate the enterprises, especially the large and medium enterprises, and truly turn them into relatively independent economic entities and socialist commodity producers and operators responsible for their own operations, profit, and loss. 2) Further develop the socialist commodity market, and establish a unified, open, and competitive socialist market setup. 3) State management of the enterprises should gradually switch from focusing on direct control to indirect control. A new socialist macroeconomic management system should be set up.

Governor Xiong said: The current situation in the province's reforms is good. However, reform is a major and unprecedented change. Problems of various kinds are inevitable. It is also very natural that people should have a variety of different views on reform. We must certainly not get panic-stricken and give up eating for fear of shocking just because some problems occur. Reform requires a number of pioneering comrades to engage in bold exploration and innovation. When certain shortcomings and mistakes occur in the course of their exploration and innovation due to lack of experience, we must enthusiastically help them to sum up the experiences and lessons, correct the shortcomings, and continue to forge ahead.

HOANG VAN HOAN VISITS SHANXI PROVINCE

HK220347 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 21 May 86

[Excerpts] Comrade Hoang Van Hoan visited Shanxi Province on 20 and 21 May. On his arrival by train from Xian, he was welcomed by Li Ligong, secretary of the provincial CPC Committee; Zhang Changzhen, member of the standing committee of the provincial CPC Committee; Luo Guibo, a member of the Central Advisory Commission; and [name indistinct], director of the provincial foreign affairs office. Comrades Li Ligong and Luo Guibo also gave a banquet for Comrade Hoang Van Hoan, and accompanied him to various places in Taiyuan City including the provincial museum.

Hoang Van Hoan also made a special trip to Luo Guibo's home to see his old friend.

Interviewed by reporters, Comrade Hoang Van Hoan said that Shanxi has an ancient history and its people have glorious revolutionary traditions. I believe that under the correct leadership of the CPC Central Committee, the people of Shanxi will certainly make contributions to invigorating China during the practice of socialist construction.

Comrade Hoang Van Hoan left Taiyuan on the evening of 21 May.

SIXTH SHANDONG PEOPLE'S SESSION CONCLUDES

SK200359 Jinan Shandong Provincial Service in Mandarin 2200 GMT 19 May 86

[Text] The fourth session of the Sixth Shandong Provincial People's Congress successfully concluded amid the playing of the majestic national anthem on the morning of 19 May after its agenda items were satisfactorily fulfilled.

The session called on the people throughout the province to more closely unite as one, to push forward the drive to conduct reforms and to pioneer the road of advance by displaying the indomitable spirit, and to strive to fulfill or overfulfill the Seventh 5-Year Plan of the province.

The closing meeting of the session held that morning approved the resolution on the province's Seventh 5-Year Plan and the report on the Seventh 5-Year Plan, the resolution of the 1985 provincial final financial accounts and the 1986 financial budget, the resolution on the work report given by the provincial People's Congress Standing Committee, the resolution on the work report given by the provincial Higher People's Court, and the resolution on the work report given by the provincial People's Procuratorate.

The closing meeting of the session also approved the three resolutions on the resignation application submitted by some Standing Committee members of the provincial People's Congress, vice governors of the province, the president of the provincial Higher People's Court, and the chief procurator of the provincial People's Procuratorate.

After full deliberation and consultation, the session balloted for 4 vice chairmen of the provincial People's Congress Standing Committee and 14 Standing Committee members of the provincial People's Congress, and decided to appoint 3 vice governors of the province.

The session also elected the president of the provincial Higher People's Court and the chief procurator of the provincial People's Procuratorate. In line with the legal procedure, the name of the elected chief procurator will be made public after the approval of the NPC Standing Committee.

Xu Leijian, executive member of the session's presidium, presided over the closing meeting. Also attending the closing meeting were executive members of the session's presidium, including Liang Buting, Jiang Chunyun, Li Zhen, Xiao Han, Gao Fengwu, Zhang Zhusheng, and Xu Jianchun.

Attending the closing meeting as observers were responsible persons from the departments, commissions, and offices under the provincial CPC Committee; deputy secretaries general of the provincial People's Congress Standing Committee and deputy directors of the general office under the Standing Committee; responsible personnel from the departments under the provincial People's Government; vice presidents of the provincial Higher People's Court; and deputy procurators of the provincial People's Procuratorate.

On the afternoon of 19 May, chairman, vice chairmen, and the newly elected vice chairmen and members of the provincial People's Congress Standing Committee got together to hold a cordial talk.

GUIZHOU CPC SECRETARY VISITS TEXTILE FACTORY

HK021311 Guiyang Guizhou Provincial Service in Mandarin 2300 GMT 1 May 86

[Text] On 1 May, International Labor Day, Hu Jintao, Provincial CPC Committee secretary, and He Renzhong, vice chairman of the provincial Advisory Committee, went to the Qingzhen textile printing and dyeing mill to extend holiday greetings to the workers and staff who stood fast at their posts on the holiday.

As soon as Comrades Hu Jintao and He Renzhong arrived at the mill at 0930, they went directly to the workshops and spent 1 hour familiarizing themselves with production in the textile, weaving, printing, and dyeing workshops. They had cordial conversations with workers. Then they went to the office to meet all the staff working there and listen to a report on production by a responsible person of the mill.

The Qingzhen textile printing and dyeing mill did well in production from January to April this year. Comrade Hu Jintao said that this was a result achieved by the 4,000 staff and workers of the mill who have been united and fought heroically. He expressed the hope that the staff and workers would continue their efforts and maker greater contributions to the country.

He said that to develop the excellent situation, factories and mines must grasp two things at present: 1) They must persevere in reforms within enterprises, further perfect and improve the responsibility system, unleash the initiative of staff and workers, and invigorate the enterprises; and 2) they must strengthen business management and produce more marketable products to open up more markets and improve their economic results. Leadership organs at all levels must change their style, do more practical things, pay attention to efficiency, and do their utmost to serve the grass roots.

YUNAN NATIONAL ECONOMIC SEMINAR CONCLUDES

HK200835 Kunming Yunnan Provincial Service in Mandarin 2200 GMT 19 May 86

[Text] The 5-day second national feasibility study and economic evaluation seminar concluded yesterday morning in Kunming. In the course of the meeting, some 100 participating specialists and scholars held lively discussions on making scientific decisions on investment projects. They also proposed many constructive suggestions.

The closing session held yesterday morning was chaired by (Zhang Tan), deputy director-general of the Economic, Technological and Social Development Research Center under the State Council. Zhou Daojiong, president of the People's Construction Bank of China, delivered a summary speech.

He said: This seminar is a gathering of specialists and scholars from three sectors namely universities and colleges, designing and consultative institutes, and relevant departments, committees and banks of the State Council. They are the core force of China and advocate the practice of making scientific decisions on investment projects. The representatives of these three sectors proposed more than 80 theses on different viewpoints at the seminar. They unanimously hold that conducting feasibility studies, evaluating the national economy and making scientific decisions on investment projects are very important guarantees for checking the scale of investment, readjusting the structure of investment and improving the economic results of investment.

Comrade Zhou Daojiong pointed out: This seminar is a meeting for exchanging ideas, examining results as well as for specialists and scholars to suggest their ways and means.

Gao Yang, a member of the Central Advisory Commission and chairman of the board of directors of China Investment Consultative Company, made an important speech at the closing session.

He pointed out: feasibility studies are new things developed in the wake of reforms of the economic structure. He encouraged the intellectuals who engage in the work to make greater contributions to making scientific decisions on investment projects and for the four modernizations.

The closing session was also attended by Ma Hong, director general of the Economic, Technological and Social Development Research Center under the State Council; Jin Renqing, vice governor of Yunnan.

XIZANG TOURISM, ECONOMIC WORK CONFERENCE OPENS IN LHASA

HK140456 Lhasa Xizang Regional Service in Mandarin 1130 GMT 13 May 86

[Excerpt] On economic work and trade, Dainba Gyaincain said: Lhasa is rich in resources for making agricultural and sideline products, native products and specialities. Through this conference, we must take immediate actions to thoroughly investigate our natural resources, make measures suit the local conditions, mobilize the positive factors of various areas, carry forward the spirit of the foolish old man who removed the mountains, and use the natural resources to develop work concerning production, purchasing and export. We must promptly create a new situation in which the economic work and trade are flexible, brisk and run in an orderly way despite strict control.

Dainba Gyaincain stressed: No matter whether we develop tourism or handle economic work and trade, we must seek a common understanding, coordinate our steps, and take the overall situation into consideration. Only thus can we achieve positive results when invigorating Lhasa City.

CONTROL OF INSTITUTIONAL PURCHASES DISCUSSED

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 9, 20 Sep 85 pp 20-21

[Article by National Staff Office in Control of Institutional Purchases under the Ministry of Finance: "Ministry of Finance Issued 'Circular Concerning Further Control of Institutional Purchases'"]

[Text] To control the irrational increase in consumption funds and to help achieve a balanced receipts and payments in state finance, the Ministry of Finance, with the concurrence of the leading comrades in the State Council, has recently issued the "Circular Concerning Further Control of Institutional Purchases." After analyzing the causes of the continued increase in institutional purchases, the circular lists the following measures to strengthen such control:

1. The control should be strictly based on the state's allocated indices. The indices for the control of institutional purchases in the current year has been allocated and relayed to the lower levels by the National Staff Office in Control of Institutional Purchases, as instructed by the State Council. All regions and departments must comply with the indices allocated by the state and see to it that these indices are adhered to at all levels, down to the basic level, and that only savings, but not overspending, are permitted. They should set up an institutional purchase account in which the quantities of commodities purchased and the amounts spent on them should be recorded.

2. The system of examination and approval for purchase of the 17 specially controlled items must be strictly enforced. Except for the motor vehicles imported by Hainan Island and some items specially approved by the State Council, approval for the remaining items will be withheld within the current year. In the future, any unit desiring to import the specially controlled items must first obtain the concurrence of the national, provincial, autonomous regional, or municipal staff office (of municipalities directly under the central government) in control of institutional purchases before starting the import procedures. Imports without this process of examination and approval will be considered as a violation of the financial law. The purchases of specially controlled commodities by units below the county level (including the collective units in townships and towns) must be first examined and approved by the staff office in control of institutional purchases above the county level.

3. The volume of institutional purchases by the regular armed forces, the people's armed forces, and the police force must be 20 percent below the actual volume of the previous year. The state' system of examination and approval for the specially controlled commodities must be strictly complied with.

4. The indiscriminate distribution of material objects or souvenirs is resolutely prohibited. In the future, except for some souvenirs distributed in the meetings of labor models and of representatives of advanced elements approved by the State Council, the ministries and departments under the State Council, or the provincial people's government, no material objects or souvenirs can be distributed in any name at the meetings held by any unit.

5. All regions and departments must include their institutional purchases in their agenda which must be periodically reviewed and precautionary measures must be taken against any possible loss of control. The expenses incurred in violation of the state's control regulations will not be reimbursed, and the financial personnel should do their jobs well in this respect. In the case of indiscriminate purchases or any excess over the control indices, the higher authorities must deduct the corresponding amounts from the retained profits or from the surplus in the contract responsibility system.

6. All relevant departments must cooperate closely in strictly adhering to the procedures of examination and approval. In making payments for the purchases of the controlled commodities by any unit, the banks at all levels must be guided closely by the approval certificate issued by the staff office in control of institutional purchases, without which, the banks must refuse to pay for these purchases either in cash or by transferring any money from one account to another. All units supplying the commodities must also carry out their transactions on the strength of these approval certificates without which, no commodity can be supplied. If any unit is found selling these commodities in violation of the regulations, its profits from such sales will be confiscated. When any unit purchases the vehicles under state control, the vehicle supervisory departments can issue the vehicle licenses only on the strength of these approval certificates.

7. In the 3d quarter of this year, the people's governments at all levels organized the banks and the finance, commerce and transportation departments to conduct check-ups on the situation of institutional purchase control. The units and individuals which had complied with the state's control regulations in an examplary manner and had reduced expenses with good results were commended, while those responsible for lavish spending, extravagance and waste in violation of the state's control regulations were disciplined, and the leaders were held responsible for their action.

LIMITS SET ON PRICE REFORM DURING SEVENTH 5-YEAR PLAN

Beijing GONGREN RIBAO in Chinese 14 Oct 85 p 2

[Article by Lu Shi [6424 4258]: "Need For Reform of the Price System and Price Regulations"]

[Text] Operation of a planned commodity economy requires conscious compliance with and application of the laws of value. Prices are the main form for expressing the regulatory role of the laws of value, and they are the most important and most responsive economic levers. Equitable prices function in many ways. They are both able to regulate the the equitable distribution in all sectors of the means of production and workforces and to regulate market supply and demand relationships. They are also able to spur producers to carry on the production of commodities at individual production times that are lower than the production times required in society as a whole, to give impetus to technical progress and to improve administration and management. Consequently, gradual reform of the price system and of price regulations are crucial to the success of the Seventh 5-year Plan.

1. Major Problems in the Current Price System

Quite a few inequities exist in the country's current price system, which are manifested principally in the following four ways:

First, no price spread for different quality of the same product. For both industrial manufactures and agricultural products, in one degree or another, there is a lack of premium price for premium quality and no lowering of price for inferior quality. For example, in the case of coal used for power, there is no price distinction on the basis of the cangue rate or calorific capacity; high grade cement is produced by large and medium size enterprises, which peg the price low while low grade cement is made by small size enterprises which, conversely, peg the price high. Cotton is graded by color, luster and length without standards for tensile strength or mellowness. All of these things are bad for improvements in product quality and the development of varieties, styles and colors.

Second, parity prices for different products are not fair. Inequities exist today in the parity prices of one farm product and another, one industrial manufacture and another and between agricultural and industrial products.

Inequities in comparative prices of industrial manufactures is manifested primarily in the overly low prices of primary products such as certain mine products, energy and raw and processed materials. Not only does this discourage production in these basic industries and bring about an enduring situation of supply being unable to meet demand, but it also discourages processing industries from improving their economic effectiveness, accelerating technical progress and lowering consumption of energy and of raw and processed materials. Take coal, for example. Each ton of raw coal in China is worth only 67 kilograms of wheat, or 367 kwh hours of electricity used in industry, or 38 kilograms of processed steel while each ton of coal used for power can be exchanged for 337 kilograms of wheat or 1,100 kwh of electricity or 165 kilograms of processed steel in the international market. Coal prices in China are obviously too low. Profits in the coal industry are also overly low in comparison with other industrial sectors. In 1982, the rate of profit on capital in the industrial sector averaged 10.6 percent while it was only 0.5 percent in the coal industry.

Third, there is an inversion between purchase and market prices of principal agricultural and sideline products in which sale prices are lower than purchase prices. Not only is this bad for a rational readjustment of the structure of agricultural production, but it is also bad for the circulation of goods. Furthermore, it increases the burden on the treasury with each passing year. In 1979 state subsidies for the purchase of grain and oil amounted to 7.3 billion yuan and by 1984 they had increased to 20.5 billion yuan.

Fourth, house rents are too low, and tertiary industry prices or fees are too low. As a result, these enterprises lack vitality and develop slowly. Some have even contracted and find it difficult to carry on . For example, the average rent per square meter per month in an urban dwelling is only 0.13 yuan, which is less than one-fifth the depreciation, maintenance and management cost. House rent for industrial employees amounts to less than 3 percent of family income, preventing a rationalization of the structure of the people's expenses. The more housing, the more subsidies enjoyed; no housing, no subsidies enjoyed. This makes it economically bad to restrict more housing and to strive for better housing. It also discourages the amassing of funds to build houses and enthusiasm for individual building or purchase of houses. Barber and bath house fees are also too low, and this occasions general losses. All these things have become impediments to development of tertiary industries and the expansion of employment.

2. Basic Requirements For Reform Of the Price System During the Seventh 5-year Plan

Reform of the price system is rather complex. It ramifies into the whole national economy and has a bearing on countless households. Consequently, it is necessary to be unswerving and to advance with measured pace, constantly exploring as one goes along.

The guiding thought in reform of prices during the period of the Seventh 5-

year Plan is the need for gradually smoothing out the present inequitable price system and striving to make the price system equitable. The following are the several general ingredients in this recipe:

First is readjustment of the prices of primary products such as energy and mine products to solve the problem of overly low prices for coal, crude oil, iron ore, non-ferrous ores, and lumber to help accurately assess the economic effectiveness of enterprises and advance the development of production and conservation of these products, which are in short supply.

Second is stable purchase prices for agricultural and sideline products, proper readjustment of the inequitable comparative prices of a small number of agricultural and sideline products for solution to the problem of sale prices being lower than procurement prices for an inversion between purchase and market prices.

Third is readjustment of tertiary industry prices or fee standards to solve the problem of overly low tertiary industry fees. Housing standards and fee collection standards should be studied. Except for certain designated subsidies, policies should be drawn up that encourage individual employees to buy houses. Pilot projects should be used to gradually attain the price differences that exist internationally, some of which result from differences in the labor productivity rates, resources, economic policies, and social systems. These problems should be solved through the readjustment of customs duties, foreign exchange prices, collection of industrial and commercial taxes on imported products, and institution of rebates of industrial and commercial taxes for goods exported. Prices for products that have little influence on the life of the people, goods that are but little produced in China, and particular products imported to nurture exports may be linked to international market prices.

Though this year's price reforms will apply mostly to the prices of meat, poultry, eggs, vegetables and such non-staple foods, nevertheless, these cannot be considered small steps. The price reform task for the next year and the year after will be efforts to digest the effects brought about in 1985 in the wake of reform measures, gradually completing individual actions, integrating them, and consolidating the results of reforms. Except for individual products for which prices are very unfair, seriously hurting production, and the flow of goods that have long since been pondered and calculated and that will be properly readjusted when the national economic situation is right, major reforms do not seem to be in the offing.

3. Need To Maintain Overall Price Stability in the Process of Reforming the Price System

Reform of the price system is a readjustment of the price structure that consists mostly of changing inequitable price parities. Product prices should rise and fall. But because prices for primary products are overly low in China's present price system, any substantial rise in prices will mean rise to a certain extent in the overall price level. To ensure steady economic development and maintain stability in the public's daily lives, we must control the trend of price rises within certain limits so that there will be no violent fluctuations in the prices of goods and so that there will be no tremendous rise in overall prices extending over several years.

To reduce to the minimum the impact on society, across the board consideration has to be given at the time of readjustment to the ability of the country, enterprises and individuals to bear price rises. Increase in the country's financial outlays resulting from price rises must be controlled within plan amounts. Rises in costs to enterprises resulting from the rise in prices of raw and processed materials have to be considered in terms of enterprises' real ability to eat such costs in addition to relief provided by state reduction or partial exemption from taxes. Specific analysis has to be made of the clamor to raise prices as a result of the rise in the cost to enterprises of raw and processed materials. The impact of prices on the standard of living has to be taken into consideration to ensure that the real income of both city and rural residents rises steadily and so that the real standard of living rises gradually. Particular care must be exercised with regard to the "food basket," which is linked closely to the standard of living. It is still necessary to take appropriate action with regard to certain goods in great demand,the supply of which must be assured. This includes providing needed government subsidies or setting price limits so as to prevent the prices of non-staple foods and other products from rising too much. In short, in the course of reform of the price system, we must strive to avoid a rise in the prices of industrial manufactures as prices of agricultural products rise, and to avoid a rise in the prices of processing industry prices as prices of raw and processed materials rise to genuinely prevent a price increase spiral and a change reaction in price rises from occurring.

Readjustment of prices of the means of production, particularly of plan prices for mine products and for raw and processed materials to make them generally fair requires a process. If action is taken with undue haste, everything having to be ironed out within a short period of time, there will be tremendous increases in prices that most processing enterprises will find it difficult to digest. Consequently, during the period of the Seventh 5-year Plan, we must continue to carry out a dual price system, i.e., to continue to set a national price for the portion of products within plan, and having a market price for that portion of goods that enterprises produce in overfulfillment of plan that they may sell themselves. In addition, prices of goods within plan must be rigorously controlled with some small planned, step-by-step readjustments made, while prices of portions outside of plan should be liberalized, the two prices gradually becoming close and finally coalescing into an overall price. This road to price reform is also in keeping with the diverse economic forms and varied forms of operation existing in the country. Certainly the twin tier price system may also bring new problems in its wake. For example, it will be disadvantageous for the development of normal competition among enterprises and it will provide opportunities for profiteering, speculation and buying solely for the purpose of selling. Therefore, price supervision and market control will have to be intensified under the dual price system, and crackdowns made on illegal activity such as speculation in buying and selling, jacking up the prices of goods and seeking exorbitant profits. Small items used in daily life and daily necessities may be farmed out for processing and orders placed. Products resulting from major raw and processed materials and from the designated use of designated materials supplied at state list prices are to be supplied to the market at national prices. Jurisdiction over price controls should be delegated to local government whenever possible. When the central government should control prices centrally, the emphasis should continue to be on proper centralization.

FINANCE AND BANKING

REFORM OF FINANCIAL SYSTEM TERMED 'MAJOR COMPONENT'

Beijing LIAOWANG [OUTLOOK WEEKLY] in Chinese No 45, 11 Nov 85 pp 12-13

[Article: Chen Muhua [7115 1970 5478] Talks About Reform of the Banking and Financial System

> [Text] Editor's Note: Reform of the banking and financial system is a major component of reform of the country's economic system during the Seventh 5-year Plan. For this reason, this publication's correspondent interviewed Chen Muhua, who is the member of the State Council in charge of financial and banking work, who answered seven questions we posed to her.

Correspondent's Question: What is the role of banks in the current economic reform?

Comrade Chen Muhua's Answer: One major aspect of reform of China's economic system is to institute a planned commodity economy with the goal of changing the former ingrown and rigid economic pattern, the country's economy thereby moving toward liberalization, enlivening and full vitality to insure realization of the magnificent goal put forward by the 12th Party Congress.

A planned commodity economy requires lively and good management of the macroeconomy and an opening up and enlivening of the microeconomy. Banks are the hub of financial activity in the national economy, and the Central Bank is the most important institution for the regulation of the macroeconomy.

Banks use the role of economic levers such as loans, interest rates and foreign exchange rates, and they apply currency policies i.e., a tightening and a loosening of money to raise or bring together funds to guide the direction of flow of funds, to improve the efficiency with which funds are used and to regulate overall social demand so that the economy maintains steady, coordinated development.

Reform of the economic system, simplification of administration, delegation of authority and the enlivening of enterprises all require reform of the banking system. This is to say that banks have to change their former sole role of "large receipts and payments," perform more of the functions of banks, meeting needs in reform of the economic system, and provide necessary conditions for enlivening the economy. With the relative decrease in plans of a command nature and the relative increase in plans of a guidance nature, it becomes even more important to apply the function of banks in the regulation of the economy and in influencing the direction, scale and speed of economic development. In short, reform of the economic system requires reform of the banking and financial system, and the success of banking and financial system reform provides important support for reform of the economic system and development of the national economy.

[Question] What progress is being made in reform of China's financial and banking system?

[Answer] The financial and banking system have been in the process of gradual reform ever since the 3d Plenum of the 11th CPC Central Committee, and definite results have been achieved in several important areas.

First of all, reforms have resulted in the founding of the Central Bank. (Up until the time of reform, China had only the People's Bank and the Bank of China.) A financial and banking structure has been preliminarily formed in which the People's Bank is the leader, the Industrial and Commercial Bank, the Agricultural Bank, the Construction Bank and the Bank of China are major specialized banks, and rural credit cooperatives and other financial institutions are auxiliaries.

Second has been reform of the financial management system with institution of funds control methods centering around current deposits and current loans. Under leadership and control of the People's Bank, funds have been divided among the specialized banks, each one being independently responsible for its own operations. The People's Bank applies centralized planning to buttress financial control of the macroeconomy through control of the amount of social credit and control of credit to specialized banks.

Third is development and improvement of various credit methods to enliven banking and finance. For example, funding of capital construction has been changed from grants of funds to issuance of loans. Initiation of technical transformation loans and providing loans is done selectively. The principle is followed of ordering goods on the basis of sales. There has been a liberalization of commercial credit in a controlled way, and the revival of insurance in China, etc.

At the present time, the emphasis in reform of China's financial and banking system is in two areas. One is the need for further improvement of techniques for Central Bank control of the macroeconomy, buttressing of financial control, and smoothing out relationships in all aspects of the finance and banking system. Second is the need to persevere in the direction of reform of making all specialized banks more businesslike and using flexibly the various economic means that banks possess to enliven finance and banking.

[Question] What are the main shortcomings existing in China's finance and banking system at the present stage? What kind of banking system has to be built to meet needs in development of the nation's economy?

[Answer] The main problem in China's finance and banking system today is that finance and banking macrocontrols are not vigorous enough. Strict system management methods and flexible and effective control methods are lacking. Relationships between one bank and another and between banks and businesses are not smooth. Problems of separation between central and local authorities with regard to the system for providing loan funds and credit funds have not been solved well. The credit implements used in the country's financial and banking system are not yet sufficiently developed; they are undiversified and funds are not used flexibly.

As reform becomes more pervasive, China will have to improve gradually the financial and banking structure that is led and managed by the People's Bank, in which all specialized banks are leading players, and in which diverse banking and financial institutions co-exist. It will take many years of effort to build a socialist banking and financial system that the Central Bank regulates smoothly, in which specialized banks operate on their own two feet according to needs of a planned commodity economy, and in which financial and banking institutions and the various forms of credit are mutually reinforcing.

[Question] What plans are there for further bank development during the period of the Seventh 5-year Plan? Objectively, how will control and regulation be exercised?

[Answer] The main goal of bank expansion during the Seventh 5-year Plan period will be to make banking and financial work gradually meet the needs of development of the whole economy. Various reform measures will have to be readjusted and improved constantly to meet needs in reform of the whole economic system. In addition to the overall requirement for strengthening of macroeconomic control and for promoting an enlivening of the macroeconomy, the banks themselves will have to focus on efforts in various regards to raise the political and professional quality of bank personnel, to introduce advanced techniques in a planned and gradual way, and to improve banking legislation.

Banking and financial work in China is carried out under guidance of the planned economy. Regulation and control of investment in fixed assets, consumption funds, the size of credit, foreign exchange reserves and the amount of currency issued must be subordinated to the overall requirements of the Seventh 5-year Plan. This means that they must carry out the national plan. Specifically, this entails various regulatory means including the use of credit plans, finance and banking policies, foreign exchange control and credit, interest rates, foreign exchange rates, and reserve funds. In enlivening the macroeconomy, special attention has to be directed toward supporting the technical transformation of old enterprises, supporting improvements in product quality and supporting the development of production of enterprises that show good economic effectiveness and whose products are needed for the market or for export.

[Question] During the last half of 1984, a situation developed of too rapid growth of consumption funds and credit funds and investment in fixed assets on too great a scale. During the first half of 1985 the State Council took action to control the amount of credit, to control the issuance of currency, and to control foreign exchange. What is the situation today?

[Answer] A series of control actions have been taken on credit and the issuance of currency during 1985 that have produced results. Overall the amount of credit has been controlled and issuance of currency has been improved. Nevertheless, as a result of the effects of inertia on economic development, plus inability to take too large steps to effect controls that affect normal economic life, the amount of credit remains too large today. It will be necessary to regulate it to maintain a balance between overall supply and demand in society. As reform of the financial and banking system improves steadily, we can make the country's financial and banking work better to meet needs in building the economy.

[Question] Please talk about possibilities for formation of a financial market in China.

[Answer] Financial markets include short term funds markets, long term funds markets, foreign exchange markets, and other forms of funds markets. Interbank credit exchange has begun to develop today among China's specialized banks and other financial institutions. The discounting and pledging of treasury bonds is permitted under certain conditions; the honoring and discounting of commercial bills of exchange is spreading step by step and trial issuance of debenture bonds by specialized banks has begun. These circumstances demonstrate a gradual maturation of conditions for the formation of short-term financial markets in China; however, conditions are not yet ripe for a liberalization of foreign exchange markets in China.

[Question] If possible, can you talk about the situation and possibilities for issuance of stock shares, debenture bonds and for floating interest rates?

[Answer] There has as yet been no large scale issuance of stock shares or plans for issuance of debenture bonds.

Interest rates on reserves have been revised twice in 1985. Interest rates are a major economic device used by banks. Suitable readjustment of interest rates for credit in accordance with needs for economic development and the development of finance and banking is a normal function of banks.

POST WAGE REFORM MEASURES IN STATE ORGANS, INSTITUTIONS

Circular on Bonuses, Allowances

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 11, 20 Nov 85 p 27

[Circular of the Ministry of Finance, and Ministry of Labor and Personnel: "Circular Concerning Problems of Bonuses, Subsidies, Allowances and Labor Insurance for Personnel of State Organs and Institutions after Wage Reform"; date of issuance not given]

[Text] Recently, the Ministry of Labor and Personnel and the Ministry of Finance issued the following circular about questions of bonuses, subsidies, allowance and insurance benefits for the personnel of state organs and institutions in Labor, Personnel and Wage Document No 33 (1985):

1. Strict Control of Bonus Payments

The regulations concerning the bonuses for the personnel of state organs and institutions have been provided in Document No 6 (1985) issued by the Staff Office of the State Council and in Finance Document No 100 issued by the Ministry of Finance. In the future, all institutions having economic income should collaborate with the Ministry of Finance in determining the proportions of income and other funds to be retained and the amount of bonuses to be paid. Bonus taxes will be levied on excess bonuses, and the specific rules will be worked out by the Ministry of Finance in consulation with the Ministry of Labor and Personnel as soon as possible for the State Council's approval.

The bonuses for the promotion of staff members and workers will still be paid in accordance with the "Trial Regulations on Bonuses for Personnel Promotion in the State's Administrative Organs."

2. Strict Enforcement of Subsidy, Allowance Regulations

All regions, departments and units must strictly abide by the regulations issued by the State Council or the State Council's Wage Reform Group, the Ministry of Labor and Personnel, and the Ministry of Finance as authorized by the State Council, concerning regional wage allowences, regional subsidies, subsidies for health hazards, subsidies for the class masters of secondary and elementary schools, and heating allowances. The scale of these payments cannot be raised without authorization. With the exception of those introduced by the regions with the written authorization of the State Council, all the subsidies and allowances introduced by the provinces, autonomous regions, municipalities directly under the central government, and the various central departments must be handled in accordance with Article 10 of the "Regulations Concerning Certain Problems in Implementing the Wage Reform for the Personnel of State Organs and Institutions" contained in Labor, Personnel and Wage Document No 19 (1985), issued by the State Council's Wage Reform Group and the Ministry of Labor and Personnel. In other words, the state does not recognize these subsidies and allowances, which, therefore, should be eliminated or revised during the wage reform. The payment of all subsidies and allowances appropriated out of the administrative and business expenses must be stopped; and the funds appropriated out of the bonus funds built up with the institution's retained income cannot be included in the basic wages. In the future, bonus taxes will be levied on the excess portion.

3. Revision of the Labor Insurance and Welfare System

The retirement benefits of cadres, staff members and workers should be paid according to the scale specified in the State Council's Document No 104 (1978). The benefits for those who have participated in the wage reform program will be calculated and paid according to their basic wages, position wages and seniority allowances. The increase, or disguised increase, in retirement benefits initiated by the localities or departments must be rectified.

The welfare funds appropriated according to regulations should be used mainly in aid of workers under hardship and for collective welfare. The practice of privately dividing the welfare funds under any pretext must be prohibited. After the wage reform, the payment for cleaning expenses by various units can be preserved in principle. These expenses will be paid out of the surpluses when the institutions concerned are responsible for its own financial surpluses and deficits or out of the extra-budgetary funds and business income. The actual payment cannot exceeded 4 yuan per person each month in the central state organs and the localities.

No region, department or unit can charge the individual workers' expenses on reading matters to its administrative or operating expenses. The expenses on various publications concerning political theories and required for the professional and cultural advancement of the cadres, workers and staff members can be paid out of the education funds. Attention should also be paid to the professional cadres' needs for special technical publications.

4. Proper Authority for Examination and Approval

According to the regulations of the CPC Central Committee and the State Council concerning the strict control of bonuses, subsidies and allowances, the authority to formulate and revise the scales of wages, bonuses, subsidies and allowances should be exercised mainly by the State Council or by the Ministry of Labor and Personnel and the Ministry of Finance authorized by the State Council. No region or department can formulate or revise these scales at will. When new projects have to be initiated and the existing regulations have to be revised, they must first be examined by the Ministry of Labor and Personnel and the Ministry of Finance before being submitted to the State Council for approval.

5. Strengthening Control and Supervision

All state organs and institutions must conscientiously implement the state regulations concerning wages, bonuses, subsidies, allowances and insurance. Any contravention must be resolutely corrected, and failure to make corrections will be severely dealt with, to the extent of holding the leaders responsible. The labor and personnel, the finance and the auditing departments at all levels must conscientiously exercise their control and supervision, while the banks at all levels have the authority to refuse any request for payment that does not conform to the regulations.

Regulations on Financial Management

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 11, 20 Nov 85 p 28

[Regulations of the Ministry of Finance: "Certain Regulations on Financial Management after the Wage Reform in Institutions"; issued 12 Oct 85]

[Text] As approved by the State Council, the Ministry of Finance issued "Certain Regulations on Financial Management after the Wage Reform," the text of which is as follows:

Article 1 These regulations have been formulated specially to strengthen the financial management of institutions, to properly organize economic income and to use funds fruitfully in coordination with the wage reform in various institutions as a means to promote their development.

Article 2 The financial departments will no longer allocate operating funds for those institutions which have been developed into enterprises and are economically independent. These institutions should abide by the relevant state regulations, practice independent accounting, and assume sole responsibility for their profits and losses.

1. According to state regulations, the after-tax net income should be used to set up business development funds, workers' welfare funds, workers' bonus funds and reserve funds. The proportion of business development funds generally should not be below 50 percent; that of the workers' welfare funds, not above 20 percent; that of workers' bonus funds, not above 25 percent; and that of reserve funds, about 5 percent. These proportions may vary at the discretion of the departments in charge according to different institutions' conditions.

2. Taxes should be paid according to state regulations. For those institutions having difficulties with the payment of taxes, tax reduction or exemption may be granted according to the tax laws and after approval by the taxation department.

3. During the wage reform of 1985, if any wage reform were carried out by any unit in accordance with the wage scale and the wage increase control figures set by the state, the province, the autonomous region, or the municipality directly under the central government, but with the unit's own financial resources, this unit will not be affected by the wage readjustments in the state organs or institutions hereafter.

4. According to state regulations, when the systems of depreciation funds and overhaul funds are set up for the fixed assets, the proportions of such fund allocations will be determined by the department in charge in collaboration with the finance department. The systems of cost control and economic responsibility should be strengthened. The scale of charges should be subject to the control and supervision of the state's price administration department.

Article 3 If an institution cannot be independent, or entirely independent economically, its funds should in principle be allocated by the finance department on the basis of the institution's business plans and tasks and according to existing state regulations.

1. For those institutions which are able to develop gradually into enterprises, to practice independent accounting and to assume sole responsibility for their own profits and losses, the subsidy for business expenditures will be reduced every year. These institutions should become economically independent within the number of years determined jointly by their departments in charge and the finance department. Before becoming economically independent, they may retain their income and use it later to cover part of their budgeted expenditure.

2. For the institutions under total budget management and having economic income, the proportion of their income retention should be determined by their departments in charge in collaboration with the finance department.

3. For the institutions under balance budget management and having economic income, the method of "assessed income, fixed amounts of subsidy, retention of increased income and savings in expenditure, but no subsidy for shortfall in income and excess in expenditure" should be adopted.

4. The institutions having no economic income will have fund allocation from the Ministry of Finance, and the method of a "budget responsibility system under which, the surplus can be retained but the shortage will not be made up" should be adopted.

5. These institutions should use their savings from increased income and reduced expenditure to set up business development funds, workers' welfare funds, and workers' bonus funds; and their proportions should be jointly determined by the departments in charge and the financial department.

6. If the institutions having economic income and carrying out wage reform in 1985 require more funds to increase the wages according to the program of wage increase for the personnel of state organs and institutions, they will provide all or part of these funds. The amount to be provided by them will be

determined by the finance department in collaboration with the departments in charge in light of actual conditions.

Article 4 The institutions carrying out the wage reform and paying bonuses at their own expense should use their bonus funds for this purpose. If the bonuses paid exceed the state limit, a bonus tax will be levied on the excess portion according to law.

Article 5 The payment of various subsidies, allowances, and labor insurance benefits by the institutions must conform to state regulations. The institutions are not allowed to set up their own regulations.

Article 6 The institutions should open a special wage fund account in the bank according to state regulations and accept the bank's supervision and examination over the use of this fund.

Article 7 The regulations for the financial management and extra-budgetary funds management of all institutions should be worked out by the departments in charge in collaboration with the finance department.

Article 8 The Ministry of Finance is responsible for the interpretation of these regulations.

Article 9 These regulations will become effective at the end of 1985.

SPECIAL ECONOMIC ZONES

SHENZHEN SEZ: ACHIEVEMENTS, PROBLEMS, PROSPECTS

Guangzhou GANG AO JINGJI [HONG KONG AND MACAO ECONOMIC DIGEST] in Chinese No 9, 25 Sep 85 pp 23-28

[Article by Liang Wensen [2733 2429 2773], Deputy Director Shenzhen Municipal Economics Research Center: "Economic Development and Prospects For the Shenzhen Special Zone"]

[Text] 1. Construction Achievements

Since its founding in 1980, the Shenzhen special economic zone has devoted 5 years of effort to the initial and foundation-laying stage. As of the end of 1984, the whole city had completed capital construction for an investment of 3.6 billion yuan, had preliminarily completed the building of 32 square kilometers of basic facilities, had opened 63 main urban thoroughfares (asphalt) from 21 to 50 meters wide and totaling 86 kilometers in length, had built the Chiwan pier for 10,000 ton ships and the Nantou helioport, and had built a large number of industrial buildings, residences for employees, commercial buildings, tourist facilities and cultural, educational and medical facilities (such as Shenzhen University, a library and a women's and children's hospital). Capital construction covering an area of more than 6 million square meters has been completed including a 2.78 million square meter housing area. A tiny 3 square kilometer village with a population of only slightly more than 20,000 has become a modern new city with an initial population of more than 400,000. Excavated from bare land, it has been praised by Americans as "an overnight city."

Industry has developed very quickly in the Shenzhen special zone and its structure has undergone tremendous changes. Before the special zone was built, Baoan County's industry had been predominantly undiversified traditional agriculture. Agriculture held a dominant position in the make-up of the society's industry. In the period of 5 years, other industries, businesses, construction industries, industrial enterprises, transportation and communications have grown dramatically with businesses, industrial enterprises and the construction industry becoming the three main pillars of the industrial make-up of the society. For example, net output value of agriculture as a proportion of national income and the proportion of persons in the whole city employed in agriculture fell from 65.1 percent and 86.9 percent respectively to 14.1 and 23.5 percent respectively in 1984, while the proportions for industry rose from 7 and 8.8 percent respectively to 27.6 and 15 percent respectively. The construction industry rose from 7.1 to 27.4

percent, and businesses rose from 14.3 to 24.6 percent. In short, as compared with the past, Shenzhen has built an entirely new industrial structure in which the proportion of industrial enterprises has gradually risen, the direction of development tending toward industrial enterprises. This has been the main cause of the rapid development of the special zone economy.

In 1984, gross industrial output value for the whole city reached 1.814 billion yuan, a 28.9 fold growth since before founding of the special zone in 1979 for an annual 97.35 percent incremental increase. Gross output value of agriculture grew 10.5 percent for an average 2 percent annual increase. Retail sales of social products totaled 2.045 billion yuan, a 15.1 fold increase in for a 74.4 percent annual average incremental increase. Financial income reached more than 500 million yuan, a 13.4 fold increase for an approximately 70.5 percent average annual incremental increase.

In accordance with central government requirements for the economic zone, the Shenzhen special zone instituted "taking four things as key links," namely taking the attraction of foreign capital as a paramount source for construction funds; taking joint ventures, cooperative ventures and independently funded enterprises as paramount economic forms; taking foreign sales of products that have been produced as a key link; and taking market regulation as a key link in economic activity. These embody the economic character of the special zone, namely a special economic zone under leadership of the national socialist economy in which foreign-funded enterprises predominate with diverse economic forms coexisting and developing.

As of the end of 1984, the Shenzhen special zone had signed 2,215 agreements with foreign traders calling for the investment of a total of H.K.$16.66 billion of which the actual amount of foreign funds invested so far amounts to approximately HK$4.137 billion or one-seventh of the total foreign investment in all of China and 22.2 percent of the total investment in construction of the Shenzhen special zone. Of the total investment in Shenzhen special zone industry, foreign investment amounted to 40.4 percent showing a gradual shift of funds mainly toward the building of industrial production.

As of 1984, the city had 609 industrial enterprises. In terms of economic forms, these included 217 Chinese state-owned industrial enterprises, or 35.6 percent of all industrial enterprises; 323 collective industrial enterprises, or 53 percent; and six state and collective joint industrial enterprises, or 1 percent. There were 54 Chinese and foreign joint venture and cooperative industrial enterprises, or 8.9 percent, and nine independently funded industrial enterprises, or 1.5 percent. In terms of the make-up of gross industrial output value, output value of state-owned enterprises amounted to 35.9 percent, collective industries 10.2 percent, and state and collective joint industries 0.2 percent. Chinese and foreign joint venture and cooperative venture enterprises accounted for 34.8 percent, and independently funded industrial enterprises accounted for 18.9 percent. This means that broken down in terms of economic form, the number of industrial enterprises having a foreign connection (including joint venture, cooperative and independently funded enterprises) amounted to only 10.4 percent of all industrial enterprises.Nevertheless,the output value of industrial enterprises having a foreign connection amounted to 53.7 percent of gross industrial output value showing the extremely rapid growth of the industrial output value of industrial enterprises having a foreign connection. The per enterprise industrial output value of such enterprises was higher than that of state-owned enterprises and collective enterprises. In the importation of technology, some imported technology was advanced, but not much. Approximately only 7 percent was of advanced world caliber and 27 percent met advanced domestic standards. For example, American "multi-terminal electronic computer systems," and laser processing production lines, as well as some of the production technology imported for "titanium dioxide," "float glass," and "hollow core glass" was of advanced international technology caliber, and some of it filled in domestic blanks. Industry in the special zone began from nothing and gradually developed, and it has developed step by step in the direction of advanced industry.

On the basis of the development of production, inhabitants' earnings and living standards have risen very greatly. For example, in 1984 the labor productivity rate for all personnel in industrial enterprises in Shenzhen City was more than 28,000 yuan, a 42 percent increase from 1983. For the special zone, the labor productivity rate was 31,000 yuan, up 48.31 percent from 1983. It had overtaken Shanghai. Employee monthly wages averaged 188.70 yuan, up 40.6 percent from 1983 and peasant per capita net income [gross income minus expenses but not minus taxes and interest payments] was 848 yuan, up 32.9 percent from 1983. In 1984, national gross output value created per worker in Shenzhen City was 5,270 yuan; in the special zone it was 5,414 yuan, which was approximately two times the average for the country as a whole, but less than one-fifth that of Hong Kong. In 1984, per capita national gross output value figured in terms of population was 3,109 yuan, i.e., more than US$1,000 to exceed the "moderately well-off level" 16 years in advance of the end of the 20th Century.

The economic situation in the Shenzhen special zone has been very good for the first half of 1985. As compared with the same period in 1984, gross industrial output has increased 92.1 percent; completed investment in capital construction has increased 75.54 percent; retail sales of social commodities have increased 25.7 percent, and financial earnings have increased 97.6 percent. In the importation of foreign capital, agreed investment increased 1.66 fold and actual investment by foreign traders increased 75.1 percent. The first half of 1985 has been characterized by the large number of accords signed for industrial project imports requiring substantial investment. This means that the special zone economy is maintaining momentum for high speed, high efficiency, and stable growth, and this is not very easy given the increased control throughout the country of foreign trade and foreign exchange, and the shortage of credit.

Formerly Shenzhen had not only a weak material foundation, but it was also fairly backward culturally. Simultaneous with the building of material civilization has been serious attention to the building of socialist spiritual civilization in the special zone, attention going to the nurturing of socialist ideological consciousness and moral values. During the past 5 years, 355 million yuan has been invested in scientific, cultural, educational and medical facilities. This is 5.3 percent of total investment and 30.6 percent of government financial outlays. The SHENZHEN TEQU BAO [SHENZHEN SPECIAL ZONE

NEWS], a television station, the SHENZHEN QINGNIAN BAO [SHENZHEN YOUTH DAILY], the TEQU GONGREN BAO [SPECIAL ZONE WORKERS DAILY], TEQU WENXUE [SPECIAL ZONE LITERATURE] and TEQU KEJI [SPECIAL ZONE SCIENCE AND TECHNOLOGY], etc. have been founded to provide a fine socialist spiritual diet.Overall, people's value concepts have changed deeply as the special zone has developed in matters such as valuing time, being concerned with efficiency, respect for the law, observing discipline, and "no achievement equals failure." They lashed out against bureaucratism and egalitarianism, and they have relatively well resisted bourgeois corrosion, degenerate ideology and behavior. A beginning has been made in the special zone of establishing a "pioneering spirit, " and seeking new ethics.

2. Fundamental Experiences

The ultra-rapid building and the ultra-rapid development of the Shenzhen special economic zone has resulted primarily from having put into effect the Central Committee's open door policy and flexible measures, and institution of systems reforms, and has resulted also from the correct leadership that the province and city have provided and the active work of the broad masses of cadres and the public. Looked at from the economic angle, fundamental experiences from which huge achievements have derived have been as follows:

1. Gradual creation of a fine investment environment. Investment environment is a comprehensive concept for development that includes political, economic and social elements. It is a prerequisite for good operation of the special zone. The finer the investment environment, the great the attraction for foreign traders. After 5 years of effort, the special zone has preliminarily established a fine investment environment. For example, preparation of the infrastructure for construction (hook ups of electricity, water, communications, gas, roads, sewage and drainage and leveling of the land) has laid a highly effective foundation for the building of facilities. Legislatively the following 12 special zone laws pertaining to special zones (including eight special laws, one regulation, and two detailed rules and regulations for implementation) have been passed and published, among them: "Guangdong Province Special Economic Zone Regulations," "Shenzhen Special Economic Zone Foreign Economic Agreements," "Provisional Regulations on Technology Imports," "Peoples Republic of China Foreign Investment Bank and Foreign and Chinese Joint Venture Bank Control Regulations." Social order is in shipshape condition and public security is fine, etc.

2. Institution of foreign imports and domestic link ups. This strategic measure has been an important reason for rapid development in Shenzhen, and it is also the two wings that have been made ready for the economy's future takeoff. Among the foreign economic relations of the special economic zone is the need to import foreign capital, advanced technology, scientific management and high level personnel, the need for the special economic zone's products to break into international markets and to help export products from inland to create foreign exchange, and the need to transport into the country information and needed natural resources and goods from outside China. In recent years, the Shenzhen special zone's imports of foreign capital and advanced technology has risen year after year, and products exported have also increased year by year, some of them having more than quadrupled. This has

played a decisive role in development of the special zone economy. Nevertheless, imports from outside have to be supported by link ups inside. If the wing of domestic link ups is missing, the special zone's economy will be unable to take off, much less be able to fly high. In recent years, domestic link ups have also developed very rapidly. By the end of 1984, the interior had supplied one-sixth of construction funds for the Shenzhen special zone; 97 percent of the professional workers who had built the Shenzhen special zone came from inland China, and 92 percent of the large army of workers also came from inland China. Inland China has provided 57 percent of the steel and 55 percent of the cement that has been used, and approximately 70 percent of goods in Shenzhen markets has been produced in inland China. The Shenzhen special zone's use of foreign capital, its introduction of foreign technology and its expansion of trade must be combined with capital natural resources, skilled personnel and techniques from inland China for the special zone to make the most of its role. In short, foreign imports and domestic link ups are an undertaking that reflects clever use of both domestic and foreign resources, the markets of the two, and the skills of the two, thereby linking the two. The closer they are linked, the faster economic development and the higher economic results.

3. Efforts to find and set up a special zone economic system model that flexibly and effectively responds to prevailing international market patterns. The Shenzhen special zone is a middle ground between the socialist economy of China and the capitalist economy of Hong Kong. It is special in form, and its economic form is made up primarily of joint venture, cooperative venture and independent venture enterprises. Consequently, its economic activity uses market regulation primarily under guidance of state plan. This is in keeping with the concept of one country, two systems and three forms. In accordance with central government requirements, the Shenzhen special economic zone has endeavored to go beyond the prevailing economic system in recent years to provide experiences for reform of the system in inland China. It conducted a series of reforms beginning with the construction industry, breaking through old rules and regulations and outmoded notions in capital construction. For the most part, it adopted a system of selective price bids from outside and level by level contracting inside, freeing production enterprises and delegating authority to them. In the circulation of goods, it adopted the method of one predominant industry and economic diversification. It instituted a program of "little control and much delegation," and it instituted an equitable fluid and floating wage system for skilled personnel. In the financial system, it instituted user fees for land takeover and issued debenture bonds, and in the monetary and banking system it instituted the introduction of foreign investment banks, issued stock certificates and and mortgage loans, etc. to clear the way for a commodity economy, achieving importatant results. In a nutshell, it proceeded largely from realities in the special zone to use the laws of value under control of the macroeconomy to make the most of the role of market regulation. It expanded commodities, raised the degree of socialization of commodities, kept open channels for the circulation of commodities, thereby enlivening the economy.

3. Problems in Moving Ahead

During the past several years some problems have also existed in moving ahead with economic development of Shenzhen. These have been manifested as follows:

(1) Exceptionally quick development of commercial trade and real estate. During the previous stage, Shenzhen's prosperity has relied mainly on these endeavors. Industrial production has been catching up since 1984; however, the industrial base remains weak, and the impetus of development in which commerce dominates has not changed completely.

(2) Too small a proportion of the special zone's products are sold abroad in international markets---less than 30 percent. Imports are larger than exports. In other words, sales inside China are large, and the marketing structure has yet to become rational; maintaining an industrial foreign exchange balance is difficult.

(3) Industrial products are not processed to a great degree. Quite a few enterprises still do only simple processing. In 1984, net industrial output value amounted to only 30 percent of gross output value. This was lower than the national average of 35 percent. Production of some electronic products consisted of nothing more than simple installation of components brought in from abroad. Technologically, labor intensive industries are still a considerable percentage of the total.

Proper handling of these problems is necessary. The special zone is diligently checking, specifically analyzing, and studying them to find solutions.

4. Whither Shenzhen?

Development of the special zone is currently in process of advancing into a new stage. It is facing the position of Hong Kong after 1977, which has already been decided, the opening up of coastal cities, and the all around launching of urban reform throughout the country. The Shenzhen special zone itself will start using the new situation of special zone management lines and getting ready to reform the banking and monetary system. Consequently, the question of where Shenzhen is headed requires further answers. Determination of strategic objectives, strategic emphasis and strategic steps to be taken, as well as what major actions should be taken to realize more fully and more rapidly the country's requirements of the Shenzhen special zone are matters that have to be explored.

Formulation of a development strategy for the Shenzhen special zone should take as its guiding thought the Central Committee's policy of opening to the outside world and the strategic intent in building special zones. It has to both focus on the attraction of foreign capital, the introduction of advanced technology and advanced management methods to make the most of the special zones' role as "four windows" and "two fans" from which radiate technology, knowledge, management and policies toward the outside world; and it has to focus also on the maintenance of the stability and prosperity of Hong Kong as well as have an active influence on the return of Taiwan to the motherland.

Formulation of a development strategy for Shenzhen also entails taking into consideration the strategic position that Shenzhen occupies. Shenzhen's strengths lie in the following: First, it neighbors Hong Kong and is able to make full use of Hong Kong's favorable conditions. Second, it instituted opening to the outside world and reform earlier than many other places, and its investment climate has already begun to take shape. Third, there are a large number of overseas Chinese and compatriots from Hong Kong and Macao in the local area who want to invest in the building of the special zone. Fourth, preparations to use the special zone's management lines and the carrying out of reforms to the banking and financial system will further open the Shenzhen special zone to the outside world. Its weaknesses lie in a lack of skilled personnel, a shortage of natural resources, a poor industrial base, a low level of technology, insufficient managerial experience, weak capacity to digest and absorb advanced technology. Except for the long-term role of the advantage of a geographical position that is close to Hong Kong, substantial changes may occur in all the other strengths the zone enjoys. As far as Shenzhen's economic relations with the outside world are concerned, most important for a certain period of time will be Shenzhen's relations with Hong Kong. Relations between Hong Kong and Shenzhen should be complementary and mutually advancing for joint prosperity. In long range terms, the international economic center is in process of shifting to the Pacific Ocean region, and the arc of the western Pacific is entering a period of high speed growth. Shenzhen should use this momentum and take all routes to develop economic relations with the outside world. As for Shenzhen's relations with inland China, Shenzhen's opening to the outside world has to depend on inland China while simultaneously serving the modernization of the whole country.

As regards the guiding thought in developing the Shenzhen special economic zone and its strategic location, the strategic goal in development of the special zone should be outward, the focus being on advanced industry, industry and trade developing simultaneously, industry, trade and technology being linked for a multi-functioning special economic zone possessed of a high material civilization and spiritual civilization. It should strive to achieve by the end of the present century a gross national product at the level of Hong Kong's around 1990, and the population of the special zone should be controlled at around 800,000. Shenzhen will not only have to build a city in which buildings stand like trees in a forest, industry prospers, communications are developed, and myriad businesses converge, but it will also have to become a culturally advanced scenic area with a beautiful environment that with a sound legal system and good public order.

5. Views On Several Problems in the Building of the Shenzhen Special Zone

Success or failure in building the Shenzhen special zone and its becoming a barometer for foreign trader investment confidence is a reflection of the special zone's role as a window on policy toward the outside world. Much discussion is taking place nowadays outside of China and in Hong Kong and Macao about the Shenzhen special zone, some of it expressing reservations. Below I will provide some of my personal views about these reservations so all can discuss them.

1. On the Issue of Whether the Special Zone Open Door Policy Is Primarily For Development of Commerce (Trade) or Primarily For the Development of Industry

Some people maintain that the Shenzhen special zone has "three many`s and one little" (many markets, many guesthouses, many restaurants, and little industry). They worry that problems have arisen in the direction of development of the economic structure of the special zone. I believe there is a certain amount of truth in this, and reminders that the Shenzhen special zone should make sure to emphasize development of industry in the future should be welcomed. But, I will have to differ on use of the situation of business and the service trades in the present economic structure of the special zone to repudiate the road that was taken during the previous stage.

A look at the long-term strategic goals in development of the Shenzhen special zone shows industry not trade to be predominant, and this is an unshakable goal. Otherwise, Shenzhen would become a free trade zone. However during the initial foundation-laying stage in the special zone, is it better to develop some industry first, or is it better to develop some business and service trades first? This bears on the issue of how to realize the strategic goals in developing the special zone. In terms of what is necessary and what is possible, commercial business had to pave the way during the foundation-laying stage. Of this there can be no doubt. The reasons are as follows:

First, the focal point for the special zones is development of industry. For the initial construction of plans, there has to first be the "seven hook ups and one leveling," which is to say that basic facilities and plants have to be built before production can begin. In addition, foreign traders coming to Shenzhen to invest have to be provided minimal services and living facilities. This is a necessary process.

Second, when foreign traders enter the special zone to invest in plant operation, they look first at whether an investment environment is in readiness and whether they will be able to make an average profit on international capital. So, at the very outset, most investment by foreign traders is in "three imports and one compensation (import of materials for processing, import of samples for processing, import of parts for assembly and compensation trade). Most such low level forms of cooperation are in joint venture, cooperative venture and foreign funded enterprises requiring little investment and small jobs. This is the stage of testing the water, and it also requires a process.

Third, the building of basic facilities requires large amounts of capital. In a situation in which the state cannot be relied upon to allocate funds for investment, development of businesses and service trades first can generate the accumulation of construction funds within the special zone. During the past several years, for each 1 percent increase in the special zone economy, government revenue has generally increased 1 percent. This has been a reflection of the rapid development of business in the special zones and the emergence of entrepot trade. It has become a "golden bridge" between production and consumption, and it has played a tremendously positive role in development of special zone industry.

It should be pointed out that it will be necessary in the future to give attention to the proportional relationship between commercial trade and other sectors, and to develop normal commodity flow. This is because in industrial development and in development of the whole economy alike, one cannot depart from ordinary business. Still, it is necessary to restrict the flow of other than normal goods. This is because in the present situation in which a two tier kind of "drop" of domestic prices and international prices exists for industrial manufactures and agricultural products, plus various kinds of preferential treatment provided by the state (including exemption from the collection of import duties), some units are keen on using the latter kind of commercial trade as the easiest way of making money so they do not want to invest in industry, or else they want to "appear to be engaged in industry when they are actually engaged in business," and this is not desirable.

In short, there has to be a greater shift toward development of industry in the future. This is the correct path. Yet, one should not suppose that the development of such an industrial structure during the Shenzhen special zone's initial phase is the orientation for development of the future or permanently, nor should one repudiate the correct path that was taken during the initial period. Such insistence that things that are to be done tomorrow be done today is not only divorced from realities in the country, but also shows lack of understanding of the international environment. Our conclusions are that the strategic objective in building the special zones is to make industry paramount and that the business and trade structure that has come into being during the initial phase of development is basically sensible, accords with objective laws, and is a historical process.

2. On the Issue of Whether the Special Zone's Open Door Policy Has Been a Failure or a Success

Some people have published articles to the effect that the Shenzhen special zone's attraction of foreign capital has amounted to only 30 percent of special zone total investment, that products marketed abroad have amounted to only 30 percent of the special zone's products, and that only a small amount of imported technology has been up to advanced international standards. In other words, the main source of capital for the special zone has been from inside China and products have been sold mostly in inland China; the goal of the "four key links" have not been realized in the special zones. They have thus come to the conclusion that the Shenzhen special zone as well the Zhuhai and Guangzhou open door policy has failed. I believe this conclusion to be wrong. It is also not consistent with the facts. A concrete analysis of the issue should be made as follows:

First, let us look at the concept of development. The special zone was set up on a very poor foundation to begin with, but within the short space of 5 years, the trend has been a rise in terms of overall percentages in the amount of foreign capital among the sources of funds, in the amount of industrial enterprises in the structure of industries, in the percentage of goods sold in foreign markets, and in the intensivity of technology and knowledge in the technological structure. For example, in 1984 the proportion of foreign investment in the total amount of investment in industry was 40 percent; net industrial output value was 27.6 percent of the city's total national income; 34.4 percent of sales of industrial manufactures were outside the country, and 45 percent of industrial plants used advanced technology in their technological facilities.

Second, one has to differentiate between goals and actions. The running of a special zone and realization of the special zone's magnificent goal requires moving along step by step; one certainly cannot reach the goal in a single leap. Making the zone into an outward looking economy and achieving balance in foreign exchange also requires a process. For an area that has just been developed, it is fairly common for trade deficits to occur during the initial phase. The history of developing nations has shown the need to go through a stage of import replacement and a gradual transition to export replacement. To achieve future goals, China's special zones have to create conditions,and they have to go through a process. One should not suppose that that the building of special zones has failed because they have not yet achieved their goals. Nor should one suppose that development of special zones requires a blood transfusionsion from the country, i.e., reliance on subsidies. This is also not in keeping with the facts.

Third, the founding of special zones is a product of special policies adopted in China during a new era. They are entirely new things for which no ready made experience exists. How to run economic zones is a gradual process of deepening understanding. Meeting the special zone's strategic goals also requires a process of exploration. At the present stage, certain goals have yet to be realized, and it has also been difficult to avoid some of the foregoing situation.

Fourth, evaluation of the success or failure of the special zone's open door policy cannot rest solely on output value, exports, or foreign exchange criteria. For example, during the past several years, the Shenzhen special zone has provided employment for more than 100,000 youths awaiting employment, and it has transmitted to inland China some advanced technology, all kinds of data, scientific management methods, and experiences in reform of the economic system to make use of its role as a "window." Some of these things cannot be quantifed. This has been particularly true of the positive influence they have had politically. For example, before founding of the special zones in 1978, more than 30,000 people from Baoan slipped away to Hong Kong. Several years ago during capital construction at Shekou when there was filling in of the sea, removal of hills, blasting and excavation, more than 200 corpses were buried of people who had drowned in an unsuccessful bid to escape to Hong Kong. However, during the 5 years since founding of the special zones, more than 1,000 people from Baoshan County have returned from Hong Kong to take up residence. Can "several key links" or several hundred million American dollars in foreign exchange earnings be used to calculate this kind of success or failure of the open door policy? In fact, this is the most convincing testimony to the economic and political achievements of the special zone open door policy.

3. On the Issue of Whether the Special Zone Open Door Policy Is a Stopgap Measure or a Basic National Policy

Some people are doubtful that the special zone open door policy is a long-term policy; they are wary of many changes in policies. For example, China's correction of unhealthy tendencies as well as the correction of some problems that have cropped up in contracts with individual foreign traders since the beginning of 1985, and China's strengthening of control over credit, foreign trade, and foreign exchange have been misinterpreted by foreign traders who suppose that China's open door policy is about to be changed.

I believe this to be a misconception and that concrete analysis must be conducted as follows:

First, the special zone open door policy is a long-term strategic policy; it is an integral part of the overall strategic objectives to be realized in China during the new era. To begin with, formulation of the special zone open door policy is rooted in consideration of the basic elements in the process of developing countries changing from an agricultural country to an industrial country. If the domestic economy includes both production and consumption, it cannot develop separate from the international economy, and modernization of domestic technology cannot move ahead separate from the new international technical revolution. China will be one of the first countries to be affected in the shift to the western Pacific region of the center of the world economy during the 21st century, and it will be placed in a stage of development of its natural resources, manpower, technology and markets. China's institution of a special zone open door policy cannot be reversed.

Second, the modernization of China will be a long process. Even with the realization by the year 2000 of a quadrupling of the gross output value of industry and agriculture, and the attainment of a "comfortable standard of living," a considerable distance will remain to be traveled. At minimum, it will take another 30 or 50 years from that time to catch up with the economic level of the presently advanced industrial countries. Consequently, China's open door policy must be a correspondingly long-term policy, which is to say that China's basic national policy is positively not a policy of expediency to cope temporarily.

Next, will the open door policy change? Everyone is aware that any economic reform is formulated for the achievement of certain economic goals, and China is no exception. As economic development of the special zones becomes a reality, how to more beneficially attract foreign capital, use world advanced technology and compete in international markets, and what is good for development of the special zones and the domestic economy are problems of common concern both to China and foreign countries. Accordingly, the basic aspects of the open door policy will not change, and if specific policies change, they can only change for the better, be better suited to the exchange between China and the outside world of capital, trade and technology, and be more in keeping with the interests of both China and the outside world. Foreign trader investors need not be greatly worried about this.

Second is thoroughgoing reform. The new unhealthy tendencies do not derive from the open door policy or system reform per se. In the correction of new unhealthy tendencies, including the banning of so called "parallel goods" and black market foreign exchange transactions, the use of every policy measure is entirely correct. This unhealthy phenomena disturb normal trade and foreign exchange markets, hurt national economic life, and make it difficult to control the macroeconomy. The reason for them is that some units and individuals take the opportunity to exploit preferential policies and concoct various pretexts to derive benefit from reform, as well as turn the public interest to personal benefit and embezzle state profits.This is to say that objectively some units and individuals do bad things without regard to the country and long-term interests, and that subjectively that the country did not have completely sound policy measures and laws in advance nor did it make distinctions with regard to special zones when taking emergency actions after the fact, but rather acted with "arbitrary uniformity." But, these were specific methods used with regard to the special zones' open door policy that are now in process of being revised. Distinctions are being made on the basis of actualities and peculiarities of the special zones and specific problems are currently being gradually solved. These, then, are specific problems in carrying out the policy; they are not changes in the basic open door policy. Even specific policies can only become increasingly realistic and tend toward perfection.

In short, the open door policy is a basic national policy for China's socialist modernization. If it is to change, it can only move ahead to change for the better; it cannot move backward to change for the worse. This is because a sealed off economy or a semi-sealed off economy offers no way out. Practice has shown and will continue to show that prospects for the special zones open door policy are wonderful.

SPECIAL ECONOMIC ZONES

DEVELOPMENT OF EXPORT-ORIENTED ECONOMY REQUIRED

Guangzhou KAIFANG [OPEN POLICY] in Chinese No 3, 8 Mar 86 pp 10-12

[Article by Ding Lisong [0002 0536 2646]: "Steadfastly Develop an Export-Oriented Economy in Special Economic Zones"]

[Text] After developing for more than 5 years, China's Special Economic Zones [SEZ's] are now fairly well-established. At the working conference on SEZ's which closed in Shenzhen recently, it was proposed that SEZ's vigorously advance in the direction of an export-oriented economy during the Seventh 5-Year Plan. A new stage in their development has begun.

Since their creation, the three zones of Shenzhen, Zhuhai and Shantou have accumulated social fixed assets approaching 10 billion yuan and built up an industrial and agricultural output capacity worth more than 3 billion yuan annually. While they have come a long way from their first days, their task ahead remains an arduous one. The SEZ's must be determined to explore new approaches unremittingly and usher in a new era.

That the zones must develop an export-oriented economy was made clear at their very inception. The CPC Central Committee and the State Council have emphasized time and again that the zones must concentrate on using foreign capital in economic development, on establishing Chinese-foreign joint and cooperative ventures and foreign-owned enterprises in their economic structure and on gearing their products toward the international market. The present proposal for an export-oriented economy in effect only epitomizes the "three concentrations." Of course, the call for the development of an export-oriented economy has deeper and more far-reaching implications than what was originally envisioned. First, the zones should play an even more active role in the division of labor in China's social and economic development by absorbing advanced technology and managerial knowledge from abroad and training personnel equipped with modern expertise and experienced in international economic practices. Second, the zones should serve as "testing grounds" for the restructuring of China's economic system and the open door policy. They should experiment boldly and accumulate experience for use by the rest of the nation. These functions have been succinctly summed up as the "four windows" and "dual radiation" by party and government leaders like Deng

Xiaoping and Zhao Ziyang, an inevitable outcome of the logical development of the party's consistent principles and guiding ideas concerning the experiment in SEZ's.

Some comrades suggest that the party seems overly demanding in that while it did not say anything about export orientation in the past, it now wants the zones to be thus oriented as soon as possible. Clearly these comrades are mistaken. Other comrades believe that the zones were previously "domestically oriented" but have now "changed course." By ignoring the fact that SEZ's develop in stages, this view is equally one-sided. At the recent working conference on SEZ's, Comrade Gu Mu [6253 2606] rightly pointed out, "As the Sixth 5-Year Plan came to a successful end, the zones' embryonic age was basically over. Their formative stage has now arrived." This conclusion has cleared up public doubts and is an important guideline for the correct assessment of the situation in the zones and the determination of the zones' development principles in the Seventh 5-Year Plan and for a long time to come.

There is yet another point of view: SEZ's should be "open" or "dually oriented" instead of "export-oriented" because they must be open to the interior as well as the world. This argument, however, fails to accurately reflect the economic characteristics or developmental goals of SEZ's. As far as the overriding concerns of reform and the open door policy are concerned, is it not true that all regions in the country, including the northwest, southwest and vast stretches of the Central Plains, should be "open" and "dually oriented" in economic matters, import foreign capital and technology and step up horizontal economic linkages between regions and sectors? Only by orienting their economies toward export can SEZ's secure a unique position in China's economy under the overall demands of reform and the open door policy. The "four-window" functions of the zones have been graphically described this way: Out go products (including those that crystallize the nation's high technology,) and in come capital, technology, management and knowledge. Similarly, the SEZ's serve as a "radiating" center in two ways: They radiate outward the nation's products and the open door policy and radiate inward mainly knowledge, technology, qualified personnel and reform experience. Should SEZ markets and hinterland markets help satisfy one another's needs? The answer is clearly yes. Nevertheless, the zones essentially buy from the interior products to fill supply gaps in their markets, while sending to the interior import substitutes and technical products that can be exchanged for foreign technology or improve production conditions in the interior, such as certain equipment and key or basic parts and materials in short supply within China. It can thus be seen that the proposition that the zone economy be "open" or "dually oriented" instead of "export-oriented" dilutes the distinctive characteristics of SEZ's and cloud their developmental goals.

To meet the demands of their formative stage, SEZ's must make economic restructuring the thrust of their work this year and next.

Over the past 5 years and more, the zones have taken big strides forward. But even as they chalked up an outstanding record, they have unavoidably left behind a host of problems in investment structure, industrial structure and production structure that are now crying for solution. Among the major problems are a series of irregularities including excessive investments in capital construction as the zones over-extended themselves in recent years, a credit explosion, the rising share of funds tied up in long-term projects, a dearth of circulating funds among production enterprises, and an upsurge in consumption funds and commodity prices; an unsound investment structure characterized by an overemphasis on nonproduction capital projects; overly rapid expansion, which precluded the establishment of a favorable investment environment within a limited area; the inability of many enterprises to add value through processing and to export to balance their foreign exchange; and the fact that the managerial standard of enterprises and the quality of cadres and workers still fall short of what an export-oriented economy requires. The kernel of the problems is this: In their guiding ideas and focus of work, SEZ's have failed to keep pace with the evolving situation or put together a sensible and effective set of regulatory mechanisms to handle the relations between the whole and the part and between macroeconomic control and microeconomic invigoration.

Addressing the working conference on SEZ's, Comrade Gu Mu had these problems in mind when he demanded that SEZ's check the scale of capital construction and concentrate on production, standard improvement and economic efficiency enhancement. In other words, the zones must conscientiously devote themselves to "consolidation, strengthening, rectification and improvement" on the basis of their achievements over the past few years. Their short-term missions are:

--Formulate annual plans as well as an economic development plan for the duration of the Seventh 5-Year Plan, based on international market surveys and national economic forecasts. The key is to set a reasonable growth rate. Special Economic Zones owe much of the brisk growth of their agricultural and industrial output value from 1980 through 1985 to a strong infusion of additional inputs. So far they have not made it their priority to increase the efficiency of capital and inputs. If they manage to ease the growth rate properly, they will be able to cut back on inputs, increase outputs and augment national income appreciably while ensuring a steady expansion in gross output value.

--Hold the line on capital construction so that credit, consumption funds and prices can be more effectively controlled. In the short haul, SEZ's should concentrate their capital construction dollars on export-oriented production enterprises (particularly enterprises financed by foreign capital) that promise to be strong foreign-exchange earners. The aim is to help strengthen export-oriented industries. Moreover, SEZ's should continue to perfect infrastructural facilities so as to create a good investment environment without delay. Accordingly, the development of nonproduction projects should be tightly restricted this year and in 1987 and no new areas should be built in principle. In strict accordance with government control requirements, capital construction will generally be maintained at the 1984 or 1985 level. If we do a good job on these several fronts, we will successfully rein in increases in credit, consumption funds and prices.

--Enhance inter-industry coordination and step up enterprise restructuring with the central aim of improving social and economic efficiency. Based on the basic demand of increasing export and balancing foreign exchange, SEZ's must select projects carefully, whether they are financed by foreign capital or organized jointly with units in the interior, in order to ensure that new enterprises are economically feasible from the outset. Efforts should be made to adjust and scale back on enterprises which have developed the capacity mainly to assemble imported parts and components for sale on the domestic market. This can be achieved through industrial guidance and such economic tools as credit, interest rates and taxes. Incentives should be offered to enterprises to encourage them to develop new technology and manufacture new products for export. Legal mechanisms should be employed in enterprise restructuring to bring enterprise operations and activities under the supervision of such government agencies as auditing, tax, customs and industry and commerce administration. Scientific working procedures and a sound management system should be devised in an all-out drive to advance the various indicators, such as product quality, engineering quality, capital turnover rate, productivity, net output value and profit rate to the forefront among similar enterprises in the nation. Such an accomplishment can serve as the basis for the establishment of a system of evaluation standards for the export-oriented economy in the zones.

--Continue to reform the economic system in depth and provide good social conditions for sustained economic development. Prolonged confinement to a closed economic model has inhibited our ability to regulate modern economic activities. Even in the SEZ's, no notable breakthrough has been made in this regard. The most serious weakness is the failure to apply indirect control mechanisms to regulate the economy properly and skillfully. For this reason, reform in the zones should focus on the establishment of a macroeconomic control system that can regulate overall growth, adjust the economic structure, create a good economic environment for enterprises and manage economic activities through economic and legal tools and modern communications. To achieve this non-direct economic objective vital to the development of an export-oriented economy, we must clearly improve the decision-making - advising - supervision - execution system whereby zone authorities manage their economy. However, bearing in mind the spontaneous tendency of administrative agencies to directly intervene in economic life, we must demand that the central bank in the zones play a particularly active role in macroeconomic regulation and the easing of capital circulation to make sure that market mechanisms function smoothly. The challenge of financial reform in the zones will be the provision of systematic safeguards to enable banks to participate in macroeconomic decision-making more extensively.

These four tasks have been put forward for the sole purpose of sparking research and thinking to help the economic structure of the zones meet the demand of an export-oriented economy. Special economic zones are an experiment in the course of which success and limited failure may well appear in turns, but both embody promise and hope. Provided we explore painstakingly, strive to forge ahead and steadfastly work to develop an export-oriented economy, the experiment is bound to succeed.

LABOR AND WAGES

METHODS OF WAGE CALCULATION IN TOWNSHIP, TOWN ENTERPRISES

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 9, 20 Sep 85 pp 22-23

[Article by Li Wenhui [2621 2429 5610]: "Several Forms of Wages and Methods of Their Calculation in Township and Town Enterprises"]

[Text] Because of the economic structural reform, labor remuneration is now linked with economic results in township and town enterprises. A new way of remuneration has been adopted to suit the conditions of each enterprise. It more aptly embodies the principle of distribution according to work and plays a positive role in developing the township and town enterprises and raising the workers' living standards. There are now many different forms of remuneration in these enterprises, but this article will present the following four along with the different methods of calculation.

1. Remuneration Based on Consumption

This method is based on a close relationship between the consumption of various materials, fuel, and power and the consumption of labor. The lower the consumption per unit, the higher will be the wages; conversely, the higher the consumption per unit, the lower will be the wages. If the workers want to earn more wages, they must not only increase the output and improve the quality, but also reduce consumption. This form of wages is particularly suitable for the processing enterprises and in the shoe, hat and garment trades in which the consumption of raw materials accounts for a fairly high proportion of the production cost. An example of the actual method of calculation is given as follows:

A certain shoe factory signed a contract for 3,000 pairs of male and 4,000 pairs of female cloth shoes. The production of these shoes was assigned separately to workshop A and workshop B. The contract stipulated that the production price was 3.20 yuan for each pair male shoes and 2.90 yuan for each pair of female shoes (regardless of their sizes). According to the factory's calculation, the production cost in the workshops accounted for 80 percent of the production prices, after the following deductions: 5 percent for taxes, 1 percent to be turned over to the department in charge as management fee; 6 percent for the factory's management fee; and 8 percent as profits. Thus the production cost was 2.56 yuan (3.20 yuan x .80) for each pair of male shoes and 2.32 yuan (2.90 x .80) for each pair of female shoes. The workers' wages were equivalent to the production cost minus the consumption of materials and the appropriation of 11 percent of the wages for the workers' welfare funds. The products were classified into grade one and grade two which should account for more than 95 percent and less than 5 percent respectively. No wage would be paid for rejects, and the materials consumed on them had to be included in the total consumption. Thus, the workshops were only concerned with production and the factory guaranteed the supply of materials and the marketing of products. In the course of production, the workshops could draw any material they wanted without the factory's examination and approval. In calculating the wages, the factory must figure out the entire production cost according to the quantity and quality of the products examined and take into account the raw materials, fuel and power consumed, and the depreciation of the fixed assets to be charged. After deducting all these items, the remainder was the workers' wages. In this example, Workshop A fulfilled the contract for the male shoes and the products were checked and accepted. In this workshop, the consumption of materials accounted for 6,100 yuan; that of power, 300 yuan; and the charge on fixed asset depreciation, 200 yuan. Then the wages for that workshop were 2.56 x 3,000 - 6,100 - 300 - 200 = 1,080 yuan. After an 11 percent appropriation for welfare funds, the actual wages for the workers in the workshop were:

1,080 - (1,080 x .11) = 961.20 yuan.

Supposing that the proportion of grade one products was raised 2 percent for which the factory awarded a 30 yuan bonus, the total wages were:

961.20 + 30.00 = 991.20 yuan.

Similarly, the consumption of materials in Workshop B accounted for 75,000 yuan; that of power, 350 yuan; and fixed asset depreciation, 230 yuan. The wages for that workshop were:

2.32 x 4,000 - 7,500 - 350 - 230 = 1,200 yuan.

After an 11 percent appropriation for welfare funds, the amount was reduced by (1,200 x 11 percent) 132 yuan. Supposing that the proportion of grade two products rose 0.5 percent for which a penalty of 20 yuan was imposed, and 5 pairs of shoes were rejected (and the materials consumed were included in the total consumption) with no wage paid, then the actual wages for the workers in this workshop were:

1,200 - 132 - 20 = 1,048 yuan.

The wages of individual workers in the two workshops can be worked out according to their attendence, the grades of technical skill, and the piecework wages in various work processes.

2. Remuneration Based on Contracts

This form of remuneration can be used for the individuals or collectives contracted to fulfill certain economic targets for the departments in charge and assuming sole responsibility for profits and losses. The system of contract responsibility is now quite popular in various forms; so too is this form of remuneration. Contracts can be signed between the individuals and the work shifts and teams, between the work shifts and teams and the workshops or factories, and between the enterprises and their departments in charge, level by level. The contractor must fulfill the targets within the contract period. Part of the income from the above-quota portion has to be turned over to the state, or used for expenses in the implementation of certain policies according to the contract, and the entire remaining portion goes to the workers. The practice of imposing no ceiling or lower limit and the close link between the interests of the state, the collective and the individuals have fully aroused the enthusiasm of the workers in production. This form of remuneration is suitable not only for industrial enterprises but also for the construction, transportation and service trades. Now let us take a township-run brick-and-tile factory for example to illustrate this method of calculation.

A contract was signed between the workshop and the factory whereby the former guaranteed a profit delivery of 4,000 yuan every month in addition to the payment of 300 yuan for the fixed asset depreciation. The taxes for the state and the fees for the department in charge were to be paid at the rate of 10 percent and 1 percent of the output value respectively. According to the contract, the workshop had to buy clay (1 cubic meter for 660 bricks) from the factory, while the factory guaranteed the supply of coal and electric power. Should the production be interrupted by any delay in these supplies, the factory would pay 1.50 yuan to each person for each day lost.

The workshop had an output value of 30,000 yuan in 1 month (this output value is not specified in the contract). According to the contract, however, a total of 15,000 yuan had to be deducted for the materials, fuel and power consumed, 4,000 yuan to be turned over to the state out of the profits, 300 yuan to be charged for the fixed asset depreciation, 3,000 yuan (30,000 x 10 percent) to be paid as taxes, and 300 yuan (30,000 x 1 percent) to be paid as management fee. Thus

Workshop wages = 30,000 - (15,000 + 4,000 + 300 + 3,000 + 300) = 7,400 yuan

Welfare funds = 7,400 x 11 percent = 814 yuan

Actual workshop wages = 7,400 - 814 = 6,586 yuan.

The wages for this workshop can be divided among the individual workers according to their duties, types of work, attendance and so forth. Similarly, the workshop can contract the work according to the targets to the work shifts and teams or even the individual workers for making unfired bricks and for firing them.

3. Remuneration Based on Profit Sharing

According to this form of remuneration, a certain proportion of the profits realized in the enterprise operations will be distributed among the workers as wages. It is suitable mainly for the commercial, catering and service trades, because the amount of labor expended in these enterprises can only be reflected by their business income. The warehouse, store, work groups or individual workers may sign contracts with the enterprise, and the enterprise can in turn sign a contract with its department in charge.

There are two methods in profit sharing as a means of remuneration. First, the sharing of realized profits. This method is fairly simple, but the various taxes (such as business tax, income tax, energy and transportation tax, etc.) and the fees to be paid in the implementation of certain policies must be taken into account in advance. This is particularly necessary for the enterprises paying fairly heavy taxes. Second, the sharing of net profits, that is, the profits remaining after the payment of various taxes, the delivery of profits to the department in charge, and the depreciation charges. This method, though fairly complex, yields fairly practical results.

Examples for these two methods of calculation are as follows:

Wages = business profits (or net profits) x proportion of workers' share.

Example 1. A certain township industrial enterprise contracted the operation of its hotel to a certain person. According to the contract, the contractor had 40 percent of the profits while the hotel had the remaining 60 percent. The business profits of the hotel in that period were 2,000 yuan. According to the contract, the following deductions should be made: 100 (2,000 x 5 percent) yuan for business tax, 200 yuan for fixed asset depreciation, 150 for easily worn out articles of low value, and 250 yuan for water and electricity. Thus

Wages = (2,000 - 100 - 200 - 150 - 250) x .40 = 520 yuan.

Example 2. If the profits in the above example were net profits, then the income tax had to be taken into account in advance. The annual income tax should be figured out according to the eight-grade progressive tax and then broken down into a monthly tax to be readjusted at the year end. Let us suppose that 45 percent of the net profits in the above example were paid as wages, and that the annual profits were expected to be 6,000 yuan. (The actual profits would certainly turn out to be different, but this should not affect the payment in advance, subject to late readjustment.) If the correct tax rate were 28 percent, then, after the deductions by quick calculation, the income tax should be 1,300 yuan a year, or 108.30 yuan a month. Thus

Wages = (2,000 - 100 - 200 - 150 - 250 - 108.30) x .45 = 536.27 yuan

4. Remuneration Based on Piecework

Here the calculation for wages is based on the output or the amount of labor spent in the production. This form of calculation is a little biased toward the output, and can be used only in limited areas. It cannot be used in the enterprises whose consumption of materials accounts for a fairly high proportion of their production cost, but is suitable for the mining and tunneling trades, such as coal mining, quarrying, or stone and sand processing, because, other than some dynamite and tools, these enterprises consume little materials. This form of wages is easy to calculate and manage.

For example, the work team of a certain sand plant had a contract with the management whereby the factory guaranteed the sales of products and the work team undertook the production. The invoices of the transportation department and the receipts of the custodians were used by the work team as proof of its output. According to the contract, the wages were 5 yuan for each ton containing less than 3 percent and 4 yuan for each ton containing less than 5 percent of clay. No wage would be paid if the clay content is more than 5 percent.

The work team produced 400 tons of sand during the contract period. After a check-up, it was found that the clay contents were below 3 percent in 300 tons, below 5 percent in 90 tons, and above 5 percent in 10 tons. Thus

$$\text{The work team's wages} = 5 \times 300 + 4 \times 90 = 1{,}860 \text{ yuan.}$$

These wages were divided among the workers according to the amount of their labor.

POPULATION

GANSU ACHIEVES POPULATION GROWTH TARGET

HK230433 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 22 May 86

[Excerpts] During the Sixth 5-Year Plan, Gansu's average annual, population growth rate was kept below the target of 12.8 per 1,000 and there were 35,000 less births than planned. This was announced at the provincial representative meeting of advanced collectives and individuals in family planning, which opened on 22 May. The meeting has been convened by the provincial CPC committee and government.

Lu Kejian, deputy secretary of the provincial CPC committee, spoke at the meeting. He said: In common with the whole country, beginning this year Gansu will enter a new 10-year peak population growth period. The national annual population growth rate must be kept below about 12.4 pr 1,000 during the Seventh 5-Year Plan. Gansu's current population growth rate is 2 per 1,000 higher than the national average. Family planning work is in a backward state in one-third of our counties. The task of controlling population growth is very arduous. The party committees and government must assign family planning work an important place and continually strengthen leadership over it.

HONG KONG

HONG KONG URBAN PLANNING FOR TRANSITION PERIOD

Hong Kong JINGJI DAOBAO [ECONOMIC REPORTER] in Chinese No 43, 28 Oct 85 pp 9-10

[Article by Liu Shaojun [0491 4801 6874]: "Preparation of a Hong Kong Land Policy for 1997"]

[Text] The preparation of a Hong Kong land policy for 1997 is an extremely important topic. During the coming 12 year period, the formulation and putting into effect of Hong Kong's land policy will have an extraordinarily important effect on socio-economic development before and after 1997 as well as stability and prosperity after 1997. This large topic is worthy of the attention and study of progressive experts and of real estate circles of the older generation.

Basic Elements in the Formulation of Land Policy

First of all, I would like to propose for discussion several basic elements affecting the formulation of Hong Kong land policies as follows:

(1) Land is the world's most precious resource. In a flourishing and industrially and commercially developed society, this resource is even more precious. Hong Kong has a large population relative to available land, the land amounting to no more than 1,067 square kilometers and the population exceeding 5.4 million. By the end of this century, the population will have increased to 7 million. Formulation of a future land policy will have to provide for adept development, skilfull use and proper distribution of this precious resource.

(2) Real estate cycles fluctuate. During the past decade or more,the Hong Kong real estate market has gone through several cycles of rise and fall. As compared with elsewhere in the world, these cycles have been characteristically relatively short and the rise and fall fairly large as, for example, the high tides of 1973, 1980 and 1981 and the ebbtides of 1974, 1983 and 1984. Although they have be related to other special factors such as the oil embargo and the September 7 talks, basically they have been unable to escape cyclical fluctuations. Moreover, a look at recent events shows these fluctuations tending toward increasing severity and the cycles increasingly short. Consequently, in the formulation of a land policy, it seems that some

efforts should also be put on land and high rise building availability so as to regulate these fluctuations and avoid further adversity for industry, business and the lives of the people.

(3 Free Operation of the Real Estate Market in a Capitalist Society. Government land policies can not interfere too much in the free operation of the real estate market. This is the only way in which to insure the confidence of local and foreign investors in Hong Kong real estate and continue investment in construction in the city so as to promote further Hong Kong's stability and prosperity.

(4) Importance of private property rights. Hong Kong has no permanent property ownership rights; it has only property lease rights. Following the joint Chinese-British statement on Hong Kong,the incumbent government may lease land until the year 2047. Promotion of any land policy by government can not violate the provisions of land lease contracts or disturb property rights. So long as it is in the public interest, should it become necessary to take back property and change land lease provisions, a certain procedure has to be followed and appropriate and fair compensation given. Furthermore, the absoluteness of property rights must be fundamentally attested to in law to maintain investor confidence.

(5) Long Range Planning. Land development is an expensive task that requires a lot of time and careful consideration. Development of a new city or town such as Tunmoon and Shatin takes more than 10 years before construction is complete Therefore, the formulation of land policies requires a combination of a stable political environment and a long period of time. Prior to the joint Chinese-British statement, the government had formulated a long term land policy, but because of the 1997 limit, there was uncertainty about how long it would run.Currently, attachment 3 and quick formulation of a basic law have been matched up for the formulation of a long term land policy extending to the year 2047 that can be implemented.

(6) Future Economic Development. Hong Kong has more than 900,000 people currently engaged in the export manufacturing industry, but fewer than 80,000 engaged in finance and banking and the service trades. Consequently, industry and exports will continue to be Hong Kong's life blood. Naturally this will require thinking about production procedures, designing and science and technology to increase competitiveness. Nevertheless, a good land policy is a necessary concomitant to this development.

(7) Government Financial Policies. In Hong Kong, with its large population relative to available land, land revenues very obviously have a bearing on government fiscal policies. Expenditures for public works, which currently run to more than HK$5 billion per year are a mainstay of Hong Kong economic activity. Were it possible for a large part of these payments to be offset by income from land development, that would be of tremendous help for Hong Kong's low tax system policy. A look at the past record shows that land earnings for the 1979/1980 period accounted for 34.7 percent of government revenues; however, during the 1983/1984 period, they amounted to only 7.4 percent of government revenues. A look at the past 10 or so years shows revenues from land at a time of stability in the real estate market to have amounted to

approximately 10 percent of government revenues. If, on the basis of this figure, current land revenues are taken to be approximately HK$3 to 4 billion, this would help government stabilize its financial expenditures and avoid tax increases.

Does the Hong Kong Government Have a Land Policy?

During 1980 and 1981, we heard quite a few people talk about government's high land price policy, and during 1984 and 1985 some people also opposed government's low land price policy, which is to say that when prices were high, government sold at a high price and when prices were low, it sold at a low price. Does government have a land policy? I think it has always had one, though it has been incomplete. For example, the land policy for the New Territories some years ago was mostly decided by the Secretariat of Chinese Affairs and the New Territories District Administration with the result that it sometimes seemed that each department had its own regulations and that policy sometimes lacked continuity and longterm planning. Even during the 1970's, there was still no long term planning for the availability of land. This led to insufficient land and high rise buildings being available during 1979 and 1980 when the property cycle rose, so land prices soared creating a panic. Yet, with the windfall receipt of approximately HK$10 billion in land sales revenues, no detailed consideration was given to the continuation and consistency of these revenues and so they were not used well but rather only added greatly to regular government expenditures. As a result, when real estate was at low ebb in 1983 and 1984 and land revenues skidded to just slightly more than HK$2 billion accounting for only 7.4 percent of government financial revenues, income did not meet expenditures giving rise to huge financial deficits, which led to an increase in taxes, restrictions on government spending and an unstable currency. Fortunately, following the founding in 1977 of the Special Increased Land Development Committee, the government began to pay serious attention to the need for a complete and uniform land policy. Subsequently, the Increased Land Development Committee gave way to the permanent Land Supply Committee, which made a detailed analysis and study of land supply and demand and coordinated with government to regulate market activity. In 1985, this committee will be merged with the Construction Industry Consulting Committee and expanded to become a permanent land and construction consultation committee responsible for providing government with views for formulation of a land policy. Thus, in the realm of of land policy consulting, one might say there is a fairly complete system. In the realm of the formulation of land policy, the Land Development Planning Committee has been set up in government that is chaired by the Colonial Secretariat and whose members are all officials concerned with land and economic policies. As such, the task of formulating a long term land policy now has the necessary organization and the conditions.

To summarize, organizations currently concerned with the formulation of Hong Kong land policy may be divided as follows:

(1) Supreme policy organizations: a) Policy decisions are the responsibility of the Administrative Bureau. b) Legislative procedures are the responsibility of the Legislative Bureau.

(2) Formulation of policies. The Land Development Planning Committee (LDPC), chaired by the Colonial Secretary, consists entirely of government officials.

(3) Policy consultation. The chairman of the newly established Land and Construction Consultation Committee is not a member of government, and the committee consists of nine government and nine non-government members.

In addition, the Urban Planning Committee also has major influence on the formulation of Hong Kong land policies inasmuch as the formulation of and changes in the use of all land in Hong Kong is controlled by development blueprints drawn up by this planning committee.

Though the work of the Chinese-British Land Committee is limited to matters in attachment 3 such as control over the amount of land sold each year, study of land development costs, and the budgeting and distribution of income from land sales; nevertheless, these issues have a bearing on basic principles and application of Hong Kong land policies; thus the decisions of this committee will inevitably influence future Hong Kong land policies.

Formulation of Hong Kong Land Policies Geared to 1997

Finally, I will briefly point out here that the formulation of future Hong Kong land policies will require consideration of the following major issues:

(1) Proper and careful study and planning for the regulation of land availability and regulation of the number of high rise buildings, with regulation and stabilization of abnormal fluctuations in the real estate market so as to avoid further socio-economic dislocations during the transition period.

(2) On the basis of two feasibility models, decisions about and implementation of long term development plans for Hong Kong (until the year 2000) now seem likely to be concentrated on landfill in Hong Kong harbor including central district, Wanchai, Honghom, Chingchao and western Kowloon. But,in current long term development, one can thing ahead to the year 2047. Therefore, viewed from the angle of fairly long term and balanced development, should serious attention be given to development of the New Territories? Development of the northwestern part of the New Territories seems particularly worthwhile.

(3) Housing policy, regulation of the development of public and private housing, and balanced development of public and private housing, will not only have an important impact on the stability of people's lives and maintenance of free dealings by real estate enterprises, but also relates to government's financial revenues. As was said earlier, government income from land forms a major part of government financial policy.

(4) Rebuilding of urban areas and the task of land development companies. Cities constantly change. Like people, they go through a process of being born and aging. When an area has delapidated buildings, an overly congested population, land that cannot be used to the full and inadequate social facilities, it has to be rebuilt. In Hong Kong there are districts that have become old and severely delapidated after only a short number of years that

must be rebuilt to meet modern living conditions. Moreover, rebuilding of these urban areas also has to be carried out continuously in different places with the lapse of time. Hence, rebuilding of the city, improvement of the urban environment and establishment of land development companies to do the work will also be an important task during the transition period. But, during the transition period, people will be extremely sensitive about having their property rights guaranteed; land development companies will thus have to proceed with extraordinary caution in taking back small numbers of property rights.

(5) Interrelationship of land income, land development costs, and promotion of project planning as well as effect on Hong Kong financial revenues.

(6) Training of professional personnel responsible for formulating and carrying out land policies as well as for scientific and technical research and development of the exploitation, use and distribution of land.

The foregoing issues all require consultation, discussion and concentrated study to become a complete land policy that will enable Hong Kong to pass smoothly through this transition period. In addition, this will lay a solid foundation for Hong Kong's future stability and prosperity. (The author of this article, Liu Shaojun is a property assessor, the first deputy director of the Hong Kong Assessors Society, the first deputy director of the Hong Kong Land Administrators Society, deputy director and concurrently secretary of the Hong Kong Society for the Advancement of Science and Technology, a member of the Hong Kong Land and Construction Consulting Committee, and the honorary director of the Modernization Society.)

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ECONOMIC JOURNAL REVIEWS SUPPLY MANAGEMENT

HK191241 Beijing JINGJI YANJIU in Chinese No 3, 20 Mar 86 pp 12-20

[Article by Yang Mu [2799 3092] and Huang Yiyi [7806 0001 0034] of the Industrial Economics Research Institute of the Chinese Academy of Social Sciences: "Demand Management Should be Integrated with Supply Management--With a Discussion of the Need for Studying and Formulating Industrial Policies at the Highest Possible Speed"--written in January 1986]

[Text] In recent years, theorists in China have achieved remarkable progress in systematically studying the inherent relations governing the working of the economy. For example, great attention has been paid to the following subjects: the coordination between economic development models and economic structure models; the relationship between the macroeconomic mechanism and the microeconomic base, between the mechanism of working of the economy and the structure of ownership, and between the direct control mechanism and the indirect control mechanism; the overall functions of the system of policies embracing financial policies, monetary policies, income policies, and so on; the comprehensive use of various economic levers like interest, taxation, and pricing; and so on. Despite this progress, however, we feel that there exists a tendency of stressing demand management at the expense of jointly using demand management and supply management in a well coordinated way. Everyone knows that a basic attainment of equilibrium between demand and supply is a basic condition for the steady development of any commodity economy. How to achieve this equilibrium is a key topic in economic theory. In the current period, our country is changing over to a planned commodity economy, so that it is absolutely necessary to stress building and perfecting the market mechanism and practicing demand management. However, can demand management completely take the place of supply management, and should macroeconomic management include only demand management? We cannot bypass this question in theoretical study. This article gives an introductory discussion of this problem.

I. Necessity and Limitations of Demand Management

Since the latter half of 1984, our country has been facing a number of problems, such as an excessive speed of industrial development, a shortage of goods and materials, a reduction of foreign exchange reserves, and so on. To solve these problems, the state has proceeded to control and reduce aggregate social demand, and has implemented step by step a series of demand management policies, like imposing strict target management on the release of credit funds, reducing the scale of capital construction, controlling the aggregate social purchasing power and total wages, and so on. At present, these policies have shown initial success; the rate of growth in the total value of industrial output has fallen from 23.2 percent in the first half of 1985 to 8.8 percent in November; the expansion of the scale of capital construction investment has been checked; and, moreover, the imbalance between supply and demand has diminished owing to the increased import [words indistinct] materials in short supply. However, it can be seen from what happened last year that relying on demand management policies alone can seriously affect the achievement of sustained economic stability and equilibrium between demand and supply for the economy as a whole.

First, there is a limit to which a demand construction policy can control aggregate social demand. Consider consumption demand. Under our country's current system, an increase in income for the workers of some localities or enterprises can easily cause a general and nationwide rise in the overall level of workers' income. Moreover, a huge balance of social purchasing power, a lag of supply of materials and raw materials behind demand, and a rise in workers' income have led to cost-push and demand-pull price increases which are developing into an inflationary pressure that induces workers to demand further rises in income. Consequently, the state's restrictive income policies can hardly be effective. From January to November 1985, in the entire sector of ownership by the whole people, the total wages distributed to workers still registered a 17.9 percent growth, whereas in the same period labor productivity grew by merely 9.8 percent, and the outstanding purchasing power of urban and rural residents exceeded 200 billion yuan. It has thus been difficult to quickly end the expansion of consumption demand. Next, consider investment demand. The per capita living space in our country's urban areas is currently only 4 to 5 square meters, which is seriously inadequate. Therefore, investment in residential construction has been growing at a steady and high rate in recent years. From January to September 1985, while the scale of capital construction was being reduced, the proportion of residential construction investment in total capital construction investment rose 2.5 percent, and the amount of residential construction investment equaled the total budgeted investment in fixed assets. Because this large scale investment could not be reduced, attempts to control the aggregate investment demand were inevitably partially ineffective. Therefore, judging from either consumption demand or investment demand, even a single instance of neglect of the multiplier effect of demand-based spending can limit the effectiveness of policies for controlling and reducing aggregate social demand. If further measures for reducing demand are to be taken, then, for one thing, the marginal costs (including economic social costs) of these measures will become increasingly higher, and for another thing, productive investment will inevitably be overly reduced, affecting future supply and causing future disequilibrium between demand and supply. Therefore, it is difficult to achieve perfect equilibrium between demand and supply by relying only on controlling and reducing aggregate social demand; a very severe measure of this type may even result in a negative gain.

Second, demand restriction policies by themselves will adversely affect the investment structure. The investment structure is a medium that can gradually bring the production structure (supply structure) in line with the demand structure. The weakest link in our country's current economic development is the incompatibility of the infrastructure which includes transport and communications facilities and so on, the incompatibility of the production capacity of energy resources industries like electric power, finished oil products, and so on, and the incompatibility of the production capacity of materials and raw materials industries like steel products, cement, and so on. In the absence of supply policies that can help pool social funds for the intensive development of certain selected industries, the relevant expensive and time-consuming investment products can only depend mainly on budgeted state investment. If the control of consumption demand and consumption-related investment demand becomes partially ineffective, a restrictive policy for controlling aggregate demand can exert a marked, albeit short-lived effect only in reducing relatively large-scale budgeted state investment projects. This will reduce the investment in those weak links which most badly need an increase in investment, portending an unfavorable change in the investment structure. In the period of January to September 1985, out of our national total capital construction investment, the relative share of nonproductive investment rose to 43.1 percent, against 37 percent in 1984, and on the other hand, investment in transport and communications and investment in energy resources grew by 19.5 percent and 27.7 percent respectively, far slower than the 38.6 percent growth in total capital construction investment. Some key construction works in the communications and electric power sectors had to be slowed down or suspended though they should have been speedily completed by the state. The current situation of our weak links is as follows: While coal output has increased quite substantially, the overstocking of coal amounts to a few dozen million tons because of the limited transport capacity; a national shortage of electric power has persisted over the past 15 years since 1970, causing an estimated reduction in the value of industrial and agricultural output of the order of 100 billion yuan and an estimated reduction in industrial profit-tax revenue of several hundred billion yuan; the total import of materials and raw materials is now approximately two-thirds of total national imports, exceeding in value the total amount of foreign exchange earned from oil exports. The present malady in the production structure, marked by hefty production activities on a weak foundation, will probably be further aggravated by the unfavorable change in the investment structure, under the condition that industrial exports cannot relatively quickly increase substantially.

Third, restrictive demand policies by themselves carry the potential danger of generating a more serious expansion of demand. For one thing, an unfavorable change in the investment structure aggravates shortage and further narrows supply bottlenecks. For another thing, a continuous expansion of consumption demand and consumption-related investment demand helps direct the greater part of unbudgeted investment funds to continuously pour into processing-industry projects that yield quick results and require small investments. The inevitable result is that the pressure of potential investment demand becomes increasingly stronger in the case of products in short supply and investment-type products. Thus, whenever demand management control, particularly the control of capital construction, is relaxed, even slightly, investment demand will quickly surge to a peak level. Short cycles will be formed in the overall process of industrial development, namely, starting of products--suspension--restarting, in the case of some key projects, and expansion--contraction--expansion, in the case of demand for certain investment-type products. These short cycles not only damage the limpidity of the socioeconomic environment and encourage enterprises and local governments to gear their actions to the short term only, but also affect the steady development and technological advance of various industries. Examples can be found in recent years. For instance, the sale of vehicles dropped by a hefty 21 percent over the previous year when investment in the carmaking industry was curbed in 1981, rose again in 1982, and increased by 21 percent and 36 percent in 1983 and 1984 respectively. Previously, the carmaking industry's annual output of 200,000 could not all be sold, but after a span of 3 years, the increased annual output of 300,000 plus a hefty import of vehicles fell short of demand. In the first half of 1985, when a restrictive policy was implemented, the market in vehicles again slumped, and the stocks in several major carmaking factories rose 17 to 58 percent between the beginning of the year and the end of June. A major reason for this phenomenon is that merely controlling aggregate demand and the overall scale of investment can easily cause society's actual total purchase of investment-type products to be crowded into periods of relaxed control, so that demand peaks and troughs alternately appear in short cycles, increasing the extent of demand fluctuations.

Fourth, restrictive demand policies alone cannot effectively deter the unchecked development of small enterprises that yield poor results. In the case of investment-type products, because demand peaks and troughs alternately appear in short cycles, various enterprises and localities are unwilling to invest in large or medium-sized enterprises which yield good results but involve greater risk and entail a longer period of construction. In periods of peak demand, market prices or disguised prices rapidly rise, so that inefficient, high-cost small enterprises can also reap relatively great benefits in the market. When demand tumbles, these small enterprises may have reaped enough profits and may switch to other products, or, given that the state can control mainly large and medium-sized enterprises, the small enterprises can continue to outdo large or medium-sized ones that are efficient and of good quality if they can continue to maintain their sales and secure an adequate supply of raw materials by illegal means like discounts or spending money on sales promotion, or even by taking advantage of the administrative protection of local governments. Consider the example of Anshan Iron and Steel Company, the biggest integrated iron and steel works in China--it is permitted to increase its output of steel by 1 million tons according to approved technological transformation schemes in the Seventh 5-Year Plan; however, under the current tight credit conditions, it can only raise 80 percent of the funds it needs. But at the same time various municipalities and counties in Liaoning are setting up several hundred high-consumption, poor-result small iron and steel works, thus aggravating the shortage of energy resources. Consider also the Fushun 301 Aluminum Plant, the largest electrolytic aluminum factory in China; it is working at less than half of its production capacity because of power shortage; however, many small aluminum factories, with a unit consumption of electricity much greater than that of large factories, have sprung up in various localities in the northeast over the past several years. In the case of consumption-type products, because there is a huge balance of surplus social purchasing power and because differences in per capita income have been relatively small in China over many years, social consumption tends to be concentrated on certain commodities; if a "peak" in the demand for several consumer goods appears in the short term and brings considerable profits to producers, various enterprises and localities will eagerly increase the output of those consumer goods, resulting in transitory investment in those projects which mostly entail a relatively small unit investment. Examples are the production of the three old major items several years ago and the current production of high-grade household electrical appliances. Theoretically, controlling aggregate social demand will promote the formation of a buyers' market in industrial products and ruin some enterprises yielding relatively poor results. Actually, however, things are not so simple. For one thing, whether in the case of investment-type products or consumption-type products, there are some industries which probably will not see an excess of supply over demand in the near future. For another thing, the continued existence of the old system means that partial market protection and segregation will also continue to exist. Moreover, because the current restrictive policies can effectively control mostly large enterprises and budgeted large-scale investment projects, opportunities correspondingly arise for the development of small enterprises and small-scale investment projects that yield poor results. Therefore, if there are restrictive demand policies alone, without definite supply policies as a complement, it will be very difficult to deter the unchecked development of inefficient small enterprises, so that the supply capacity of those with poor results greatly develops at the expense of those which yield good results.

To sum up, although we feel that the present policies for controlling aggregate social demand have relatively satisfactorily curbed the overheating that occurred in the course of our economic development, they cannot solve the problem of equilibrium between aggregate demand and aggregate supply, or make the supply structure compatible with the demand structure, or remove the potential danger of further expansions of demand, or curb the unchecked development of small enterprises that yield poor results. We have reason not to expect too much of the current policy system.

II. Coordinating the Use of Demand Management and Supply Management

Over the past several years, equilibrium between social demand and supply has indeed been rather successfully attained, within certain limits, in Western nations mainly by using fiscal and monetary policies in coordination and by alternately stimulating and restricting demand. However, we must note the great differences in economic circumstances between China and the Western nations. First, ours is maturing-type economy of the 1980's, which differs from most Western nations of the 1960's and 1970's. Our nation lags far behind other nations in living standard and living conditions. In the long term, the method of controlling aggregate demand alone, without quickening the expansion of supply capability to achieve equilibrium between demand and supply, will not work. Second, ours is a developing country; not only are resources and funds inadequate, but the infrastructure is backward and much remains to be improved. We differ from the Western nations which, in the course of several centuries of sustained development, have been able to gradually expand their infrastructural facilities and investment in public utilities during times of dwindling demand. The situation facing us is that while rapidly increasing consumption demand must be satisfied, the building of the infrastructure must also be promoted on a full scale. If we only control aggregate demand, which cannot really be fully controlled, an adequate investment in infrastructural construction cannot be genuinely ensured. Third, our country is currently undergoing a change from the old directive-type economy to a planned commodity economy, and differs from the Western nations which have been developing for a long time under the circumstances of a commodity economy. The limpidity of our markets is poor and our price signals cannot correctly reflect demand and supply conditions. Even if aggregate demand is successfully controlled, our markets currently cannot help solve the possible problem of blind development. Fourth, whereas the Western nations have a complete system of commodity, labor, capital, and foreign exchange markets, things are different in China; though our commodity markets have been initially established, markets in various production factors are not yet well developed and great frictional forces are affecting the flow of production factors; and, in the absence of certain corresponding measures, the rapid pooling of production factors by certain industries and enterprises will be very difficult, so that the time lag involved in the readjustment of the supply structure will be too long.

Therefore, we think that policies in China cannot have the same results as in the Western nations if we rely on demand management alone. But the question is that demand management is not the only way of achieving equilibrium between social demand and supply. Thus, in analyzing Western society in its early phase, Marx said: "The expenditure of definite quantities of total social labor of various types is necessary for those quantities of products which correspond to various quantities needed. This need for allocating social labor in some definite proportions certainly cannot be eliminated by the specific forms of social production; what can be altered is merely its form of expression. This is self-evident." (Footnote 1) ("Selected Works of Marx and Engels," "To L, Kugelmann (July 11, 1868)," Vol 4, p 368) Western society in its early phase could only rely on the spontaneous functioning of the market to allocate the quantity of labor and readjust supply, so that the frequent occurrence of disproportion and cyclical economic crises was inevitable. In the socialist states, founded on the basis of Marxist theory, the replacement of private ownership by public ownership helps create conditions for consciously developing supply according to the right proportions, achieving equilibrium between demand and supply, and avoiding waste. It can be said that stressing supply management in achieving equilibrium between demand and supply is precisely an unprecedented feat of the socialist states in the world history of management. No one can deny that this unprecedented feat did open up a path of rapid industrialization for the USSR after the October Revolution, for post-liberation China, and for other socialist states. Of course, there is no denying the fact that our construction has been affected by grave problems such as the practices of one-sidedly striving for a rapid growth in output value, exercising overly rigid control, fettering the enthusiasm of the enterprises and localities, ignoring market demand and the functions of the market mechanism, and so on. However, those problems are precisely due to violation of the correct idea of proportionate development, aside from reasons connected with the system. Under the guidance of the spirit of the 3d Plenary Session of the 11th CPC Central Committee, while vigorously invigorating the enterprises, perfecting the market mechanism, and strengthening demand management, we are also carrying on China's tradition of supply management, developing supply according to the correct proportions and with relatively good results. This will be conducive to a sustained, steady development of our economy and will more satisfactorily reflect the essential significance of the planned commodity economy.

The postwar economic history of various nations shows that supply management is gradually becoming an important part of the Western nations' macroeconomic management. Japan and West Germany, the two postwar economic miracles, have always exercised supply management to a greater extent than other Western nations, while simultaneously practicing demand management, in the course of their economic development. Japan vigorously developed heavy industries and chemical industries in the 1950's, and quickened the development of the machine-building industry after the 1960's, thus achieving unification of the machine-building, electrical machinery, and instrument manufacturing industries. West Germany did the same. As early as in 1948, Erhard, a disciple of the theory of social market economics, carried out a reform of the monetary system, and at the same time organized and implemented "a crash program of producing various categories of cheap garments, shoes, and daily necessities in short supply." (Footnote 2) (Ai [1002] Ha-te-li-qi [0761 3676 6849 1142] (American): "The Rise of the Fourth Reich," Shijie Zhishi Chuban She [World Knowledge Publishing House] 1984 edition, p 14) In subsequent development various West German administrations invariably strived to build an overall structure conducive to industrial development. The governments of some rising industrial countries like South Korea, Brazil, and so on, have further adopted various measures to support the development of their key industries like shipbuilding, carmaking, and so on. Even the U.S. Government, which for many years followed the Keynesian policy system, began in the late 1970's to adopt an increasingly larger number of supply management policies in order to deal with stagflation and foreign competition. For example, it has relaxed the interpretation of antitrust laws and permitted enterprises to carry out joint research and development programs for producing new products; it has encouraged investment in high-technology industries by tax cuts or exemptions; it permits accelerated depreciation allowances according to 1981 tax laws on automobile manufacturing equipment and special lathes and so on so as to promote the renewal of the equipment of traditional industries; it agreed in 1979 to provide loans amounting to 1.5 billion dollars to Chrysler, the third largest car manufacturer in the United States, to help it restore production; and so on. In announcing his "economic revitalization program" upon becoming president, Reagan clearly stated that supply-side economic was his theoretical basis. In the 1984 U.S. presidential election the Democratic Party, which used to adhere to Keynesian economics, surprisingly chose the advocation of industrial policies as their election campaign slogan. Although on the increase or reduction of state intervention they were sharply opposed to the policies of Reagan and his Republicans, they were surprisingly unanimous with the Republicans in regard to the basic policy of attaching importance to supply. Of course, both the Republicans' policies and Democrats' election campaign slogans were in fact bourgeois politicians' political tools; nevertheless, they did at least reflect changes in public opinions and social choices in the United States. Western communities have begun to realize that the economic problems facing them cannot be effectively solved by relying only on demand management and the market. In today's world of the 1980's, we have no reason to ignore these changes of the past several decades in Western concepts of macroeconomic management, to keep on mechanically citing the Keynesian theory, or even to conceive the modern commodity economy in terms of Adam Smith's theory, treating supply management as incompatible with the market economy.

Theoretically, there are at least several reasons why supply management should be applied to an increasingly greater extent in a modern commodity economy in conjunction with demand management. These reasons are:

First, functionally, supply management and demand management are two considerably dissimilar methods of macroeconomic management. Each can supplement, but not replace, the other. Demand management aims to counteract economic cycles by depressing or stimulating demand, and to achieve equilibrium between demand and supply under the condition of a relatively satisfactory level of employment. The time span involved is short, and the main object of management is demand. But supply management aims to quicken economic development through improving the efficiency and results of supply and optimizing resource allocation, to increase future supply capability, and to achieve equilibrium between demand and supply. This is a medium-term to long-term matter, and the main object of management is supply. These differences in goal and object call for corresponding differences in the methods and means of management. Demand management mainly deals with aggregate quantities; various macroeconomic aggregates, like aggregate demand, aggregate supply, the overall employment level, the total circulation and stock of money, and so on, are analyzed, and on this basis fiscal, monetary, and income policies are formulated to achieve balance and coordination between various aggregates. On the other hand, supply management mainly deals with individual quantities; thus, in the light of general trends of world economic, scientific, and technological development, and in the light of domestic conditions and various nations' experiences, various industries and various categories of enterprises are subjected to different degrees of management; curtailment, augmentation, relaxation, restriction, acceptance, or rejection may be practiced as warranted by individual cases, so as to enhance the results of resource allocation under the precondition that the aggregates are in proper balance. If demand management is viewed as a main switch controlling various aggregate levels, then supply management is like a fine-tuning device controlling the demand and supply levels of various individual economic quantities. Obviously, for any economy, short-term equilibrium cannot replace long-term coordination, and control of aggregates cannot replace the fine-tuning of individual quantities.

Moreover, very often, the market mechanism cannot effectively resolve certain major problems of resource allocation. If there is only demand management, society will completely depend on the market mechanism in allocating resources and fine-tuning supply under the precondition that aggregates are in equilibrium. After several centuries of development of the commodity economy, the Western nations have learned that the market mechanism is not always effective. In Western economics, there is an important concept called market failure, which means that the functioning of the market mechanism is usually ineffective when external economies or diseconomies exist under the condition of monopoly, when certain goods and services are produced for concurrent public consumption, or when the market mechanism is imperfect. Then, government must safeguard overall social results by adopting certain supply management measures. This ineffectiveness of the market mechanism is repeatedly mentioned in the reports of some economists from the East and the West who came to lecture in China over the past several years. For example, at a seminar held in China last year, the Hungarian economist Ke-er-nai [4430 3643 1143] said: "The market also often fails to satisfactorily resolve certain major problems of allocation and reallocation. Correct government actions are certainly necessary. The market is a regulatory mechanism which can produce both desirable and undesirable results." (Footnote 3) (Ke-er-nai [4430 3643 1143] Ya-nuo-shi [0068 6179 0087]: "The State Enterprises' Dual Dependence--the HUNGARIAN Experience," in JINGJI YANJIU, No 10, 1985)

Furthermore, judging from the general process whereby the less developed countries have caught up with or surpassed other countries, a "principle of effective supply" does objectively exist, according to which general supply capability differs from the kind of supply capability that yields better economic results. Genuinely effective supply is that which both embodies supply capability and yields better results. A country that can more quickly achieve effective supply can also more quickly catch up with or surpass other countries. Unlike the developed countries which are at the forefront of world economic development and which can only advance by exploration, the less developed countries always have two options in building their own supply capability: first, allow the random functioning of the market to form a general supply, and then allow domestic and international competition to eliminate the inferior, leaving the superior to survive, so that general supply can gradually develop into effective supply; and second, study and assimilate the experiences of the developed countries, and correspondingly adopt policies or measures to promote the direct transformation of the limited domestic resources into effective supply, or to quicken the formation of effective supply. Clearly, the first option basically depends on the working of the market mechanism; it can lead to the formation of effective supply, but takes a long time. For a developing country of the 1980's which is under the pressure of increasingly more intense international competition and increasingly stronger domestic expectation of, and demand for a higher living standard, it is doubtful whether there is so much time for steadily developing the commodity economy in this way. The second option means greater state intervention and the need for taking risks related to the correctness of policy options and the possibility of erroneous government actions in the form of giving arbitrary and impracticable directions; however, if appropriate options are taken, the countries can more quickly catch up with or surpass other countries. Over the past several decades, those less developed countries in the world which have developed rather quickly have invariably taken the second option; they have adopted supply management measures to a greater extent than the developed countries to quicken the formation of effective supply.

In the light of the analysis above, it is both possible and necessary to use a combination of supply management and demand management to achieve demand-supply equilibrium and steady economic development. In developing the socialist planned commodity market and gradually perfecting the market system, we should note: 1) perfecting the market system takes a relatively long time; and 2) even when the market system becomes perfect, not all problems of resource allocation can be effectively resolved. However, for a developing country, building an effective supply as quickly as possible and shortening the time needed for catching up with or surpassing other nations are very urgent matters. Therefore, we should attach importance to both demand management and supply management. For one thing, we should use fiscal policies, monetary policies, and so on to control the scale of society's aggregate demand and to set appropriate limits for the rate of growth of aggregate supply, so that a buyers' market can gradually be formed in the case of the majority of commodities, and competition and technological progress can be promoted. For another thing, we should use industrial policies and so on to quicken the rational flow of production factors, to optimize resource allocation, and to quicken the rationalization of the enterprises' scale, so that effective supply can be formed, supply can be relatively quickly improved in terms of quantity and quality, and society's increasingly growing needs can be satisfied.

Of course, it must be further clarified that what this article means by attaching importance to supply management is that in the course of building and perfecting a planned commodity economy, we should pay attention to adopting those policies and measures which help improve and upgrade the results of existing supply, and we should learn from the experience of development of other countries so as to optimize resource allocation and directly form a new supply capability that yields relatively good results. This is basically different from the past method of simplistically subjecting products to directive management. The practice over the past 30 years or more tells us that in order to improve the results of supply, we should strengthen the enterprises' vitality and competitive ability in the international market aside from optimizing resource allocation and improving macroeconomic management. This calls for the building and perfecting of a competitive market and also the control of aggregates through demand management, instead of having the state decide everything and allowing supply to determine everything. On the other hand, however, learning from past experiences does not mean that we should exclude supply management from macroeconomic management or, as simplistically asserted by some comrades, we should "control demand and give free rein to supply."

III. Study and Draw Up as Quickly as Possible Industrial Policies as the Principal Means of Supply Management

It appears at first sight that the concept of industrial policy is a new and foreign one. This term first appeared in the 1950's and 1960's in Western Europe and Japan. In recent [words indistinct] has been frequently used by the media and theorists in some newly industrialized countries and even in the United States. According to Western economists' definition industrial policy is a collective term for a group of government policies which serve to alter resource allocation among industries, or to impose intervention on the organizational structure of certain industries so as to prevent the possible damage done to overall national interests as a result of certain unrestricted functions of the market mechanism. (Footnote 4) (See Masahiro Okuno and Kotaro Suzumura: "Economic Analysis of Industrial Policy: Framework Through the

Japanese Experience," a thesis presented at the 15th Asia Pacific Trade and Development Conference, 1985, Tokyo) In other words, industrial policies serve to supplement the commodity economy's market mechanism through supply management and to optimize national interests. In the light of this definition, some of our major state policies of the past concerning industries, and related to resource allocation and reorganization of industrial production, can also be called industrial policies; these policies included: taking steel as the key link; giving priority to the development of heavy industry; encouraging the development of five industries producing light products and industries in the countryside and towns; other policies adopted since the 3d Plenary Session of the 11th CPC Central Committee like "assigning priority in ways" to light industry and the textile industry, invigorating large and medium-sized enterprises, promoting the technological transformation of enterprises, encouraging the export of industrial products, and so on. It can be said that every socialist country, which views the planned and proportionate development of the national economy as an objective economic law, begins to have industrial policies from the day of its birth. In discussing industrial policies, Western scholars have had many treatises of socialist countries' industrial policies. (Footnote 5) (See "American Journal of Economics and Sociology," January issue, 1985; quoted in "Guowai Shehui Kexue Qingkuang [The Condition of Social Sciences Abroad]," No 10, 1985) A-mi-ta-yi [7093 1378 1044 0122] Ai-te-yi-ao-li [5337 3676 0122 1159 0448], the American sociologist who designed the industrial revitalization program for Carter's presidential election campaign of 1980, said without reservation: "industrial policy is planning," while the rivals were only using "a milder, more pleasing term." (Footnote 6) (See "Journal of Comparative Economics," Vol 8, No 4, Dec 1984, pp 377-412) Therefore, though we did not use the term industrial policy in the past, industrial policies are actually inherent in the socialist planned economy. At present, when our economic system reform has been going on for several years, some scholars have been unanimously talking about attaching importance to the study and formulation of industrial policies when they study how to control the scale of capital construction, how to control the speed of economic development, how to achieve equilibrium between social demand and supply, and so on. Instead of being a simple coincidence or a reflection of sequential influence in research, this precisely indicates that many comrades, proceeding from different viewpoints, have arrived at the same knowledge that while we are correctly carrying out a reform of our system and importing the market mechanism, there also exists a tendency of neglecting the use of supply-side measures to promote the planned and proportionate development of production. Whereas past experience told us that it is wrong to neglect and negate the market mechanism, present experience tells us that it is wrong to overly rely on the market mechanism.

Of course, it must be stressed that the industrial policies we now advocate must suit today's socialist planned commodity economy; they markedly differ in many aspects from the policies and plans applied in the past when market mechanism was absent or ignored. First, they are based on the goal of strengthening the vitality of our enterprises, particularly the large and medium-sized enterprises under ownership by the whole people, so that they can genuinely become relatively independent units which produce or deal in commodities. Both the promotion of the oriented flows of factors of production and the promotion of rationalization of the organizational structure of production are realized specifically through the enterprises. The granting of preferential treatment, subsidies, or tariff protection to certain industries or enterprises to pay heavy taxes, to undergo forced depreciation, or to surrender their domestic market share, and so on, are all done to help or force enterprises to acquire greater capability for self-development. This differs from what happened in the past, when the state directly determined everything concerning development and bore the risk of decisionmaking, thus progressively increasing the state's financial burden and reducing the enterprises' vitality. Second, the principal feature of our present industrial policies is that through plans and industry planning that provide unified guidance, they encourage the banking, financial, customs, and other relevant departments to achieve coordination in using various economic levers like interest rates, tax rates, depreciation rates, subsidies, exchange rates, and so on; they promote the pooling of society's funds and resources for use by certain industries and enterprises; and they help the enterprises acquire better economies of scale in the course of extending horizontal links and practicing cooperation between specialized units. They supplement the market mechanism and quicken the formation of effective supply through market competition, in contrast to the past practice of relying on administrative orders to effect the egalitarian transfer of resources, the closure or combination of enterprises, the suspension of production, or a shift to other types of production, thus disrupting and suppressing the market mechanism. Third, our present industrial policies pay attention to integral and coordinated development that is compatible with the inherent links of industrial chains; for example, they make the trade, industrial, and agricultural sectors form a complete chain for development the export of key products; they make import, digestion, and assimilation form a complete chain for quickening technological progress; they make urban and rural planning, development and building of houses, the construction materials industry, and the manufacturing of household equipment form a complete chain for quickening the improvement of the living condition of our urban and rural residents; and they make transport planning, the building of transport infrastructure, the transportation work of vehicles and ships, and the manufacturing of aircraft form a complete chain for rapidly improving our currently backward transport capability. They differ from the past practice of erecting barriers between various departments, between provinces and municipalities, between the central and local authorities, between military and civilian industries, and between industry, agriculture, commerce, the transportation sector, and the construction industry, [words indistinct] resources were allocated only according to base figures compiled on the basis of the data of previous years, thus obstructing the flow of production factors, or, resources were wasted because of certain investment projects which, despite being useful from the partial point of view, actually yielded benefits at the cost of losses elsewhere from the national point of view.

Although some industrial policies being implemented in our country are playing a definite role in promoting economic development, they are gravely inadequate in the light of the requirements of a planned commodity economy; they are not yet very satisfactorily coordinated with the existing demand management policies. In general, our industrial policies are relatively deeply ingrained with the vestiges of the old system. Not only are some old policies still being used without examination or correction, so that they continue to fetter the enterprises, but some newly formulated policies and measures have not departed from traditional conventions. For example, in our reform, the state readjusted the prices of some materials and raw materials, hoping to force the processing industries to reduce consumption and improve results. In the earlier half of last year, however, some industrial management departments explicitly stipulated that the ex-factory prices of the products of the enterprises under them should without exception be correspondingly raised by a certain extent, and the reallocation of market shares among enterprises through competition, which should have helped divert resources toward those enterprises which yield good results, was forbidden. Functionally speaking, they do not perform the bonding action of forming complete chains or systems; various policies restrain one another, nullifying the anticipated effects. For example, though our shipbuilding industry has made a good start in recent years in exporting ships, problems of pricing, borrowing money, division of foreign exchange earnings, taxation, and so on have made it better to buy foreign vessels rather than Chinese ones, to buy old vessels rather than new ones, to hire vessels rather than buy old vessels, and to entrust freight to foreign companies than hire vessels. This anomaly, coupled with a decrease in the ordered volume of freight using Chinese vessles, have correspondingly raised the fixed costs and designing costs of ships for export, and weakened the competitive ability of our shipbuilding industry in the international market. Thus, implementing the state policy of encouraging the export of products of the machine-building and electrical machinery industries is very difficult in the case of the shipbuilding sector. Structurally speaking, an overall planning of the industrial structure is lacking. For example, which industries ought to develop faster than before in terms of investment? Which industries should develop faster and prepare themselves for a hefty future export of their products? Which industries should right now strive to extend their share in the world market so as to earn foreign exchange for the benefit of our overall economic development? Which industries should now give up their domestic market share? In how many years should some industries give up their domestic market share? And so on and so forth. In the absence of this kind of overall planning, the existing policies can only tend to be geared to urgent current problems, and there is a lack of circumspect and farsighted consideration. For example, in the face of a shortage of energy resources 2 years ago, the state adopted the policy of "tapping the natural resources quickly while they are available," and obtained relatively good results in achieving short-term equilibrium in the energy resources sector; however, this led to problems like an increase in the amount of coal falling away in coal producing regions, a definite degree of destruction of mineral resources in some localities, and so on; and ways of achieving a steady long-term development of energy resources supply were not adequately considered. Similarly, over many years, in facing "flood peaks" in the demand for certain products, the state has repeatedly landed itself "in a state of emergency in preventing flooding"; it has not done preparatory work in regard to supply or appropriate channelling of consumption, measures that could have been taken with good foresight; in controlling the scale of investment or volume of import, simplistic categorization has been the only course of action, no consideration being given to whether a case is important or not, urgent or not; and so on. Considering actual measures, the state lacks effective means of ensuring success, so that some policies have remained empty talk or conceptual ideas for many years. For example, some strategic key areas of development were proposed several years ago and the building of mainstay industries has been put forth recently; for one thing, we must have appropriate methods for changing the traditional practice of allocating resources and funds to various segregated localities or sectors according to base figures, and for another thing, we must have appropriate measures for pooling funds by attraction or compulsion for developing those projects and industries under the condition that decisionmaking power should be gradually decentralized. Without joint efforts in these two aspects, the success of the so-called key things and mainstays cannot be ensured.

Considering various countries' experience and our national condition, we think the industrial policy system which China must now quickly study and establish should include three major parts: First, we must select and theoretically study those mainstay industries which over a certain period in the future will greatly affect China's economic development, and we must promote the pooling of society's funds and resources for developing those industries, so that they can develop more rapidly than before with relative stability. Second, we must study and formulate policies concerning the development of every industry, working out some policies and measures which can promote industrial modernization as existing conditions may allow. Third, we must study and formulate some inter-industrial policies concerning enterprises, such as policies for invigorating large and medium-sized enterprises, policies against monopoly, policies for helping develop horizontal links between enterprises so that organized groups of enterprises can be formed, policies for rationally quickening the development of enterprises in rural areas and towns, and so on. Implementing these three categories of industrial policies will entail the use of certain economic, legal, and administrative measures, as well as the coordination of various other policies, like those concerning investment, technology, import and export, consumption, finance, monetary matters, and so on. Thus, we can view industrial policies as a policy system aiming to modernize our economic structure, industries, and enterprises, and to improve the results of supply. They and those fiscal, monetary, and other policies which aim to control or stimulate demand, like warp and weft, together form a policy network which can form a unified entity to regulate the actions of the enterprises and other social organizations.

Because, judging from their content, industrial policies have those characteristics mentioned above which are strongly system-related, the study and formulation of industrial policies cannot be accomplished in a short time. However, as mentioned in the first part of this article, the existing demand management policies are subject to certain limitations and using industrial policies as soon as possible to make up for their deficiency is a highly urgent matter. We think this dilemma can be tackled in three ways. First, we can immediately adopt certain short-term measures which have not been subjected to full theoretical scrutiny but about which people have more or less the same views; for example, under the precondition that enterprises are encouraged to ensure good product quality, we can quicken the production of certain light industrial products, textile products, materials, and raw materials which are currently in short supply on the market, so that the speed of industrial development can be basically maintained at the current level, and development will neither be too rapid or too slow; while controlling the scale of capital construction, we can ensure the continuance of existing investment in key projects in transportation, communications, and electric power, so that even in times of economic contraction the relative share of investment in communications and electric power can grow; and we can draw up industrywide regulations governing high-consumption, poor-quality small enterprises, forcing them to close down by means of fines, not issuing production permits to them, and so on. Second, with the help of our existing department management bodies, we can appraise and examine all existing industrial policies from the viewpoint of whether they are conducive to developing the socialist commodity economy and improving the results of social supply. We can encourage the strengthening of horizontal inter-departmental links and the giving up of narrow-minded concern for department interests; we can propose better policies along the lines of the industrial chain concept and formulate some provisional regulations embodying industrial policies. Third, we can organize groups of comprehensive departments and experts working under the state to spend a number of years to conduct a theoretical study on comparative systems, to select some mainstay industries, and to establish a relatively systematic industrial policy system with well coordinated elements.

Like demand management, industrial policies, as a principal means of supply management, are subject to limitations. The principal limitations are: First, overly elaborate industrial policies containing many trifles may overly restrict the enterprises and adversely affect the development of their enthusiasm and pioneering spirit. Second, some industrial policies formulated without systematic analysis and economic evaluation may result in the issuing of arbitrary and impracticable directions, the disruption of the market mechanism, and deterioration, instead of improvement, of the results of supply. Third, the selection of mainstay industries entails definite risks of decisionmaking; any abrupt, unanticipated changes in the domestic or international setting may cause a waste of social resources. In studying and formulating industrial policies, we must consider these limitations and be careful; we must not treat them merely as a panacea. Only by considering problems in this way, with the macrosystem and not merely a single path in mind, can we relatively consciously pay attention to the symbiotic integration of planning and market, the integration of demand management and supply management, and the integration of fiscal, monetary, and industrial policies; only thus can our macroeconomic management attain a high standard.

NATIONAL POLICY AND ISSUES

JINGJI YANJIU ON RECONSTRUCTING MICROECONOMIC BASE

HK200540 Beijing JINGJI YANJIU in Chinese No 3, 20 Mar 86 pp 21-28

[Article by Hua Sheng [5478 3932] and He Jiacheng [0149 1367 2052] of the Economics Research Institute of the Chinese Academy of Social Sciences, Zhang Xuejun [1728 1331 6511] of the Economic Readjustment Office of the State Council, Luo Xiaopeng [5012 1420 2590] of the Rural Development Research Center under the State Council, and Bian Yongzhuang [6708 0516 1104] of the Finance, Trade and Pricing Economic Research Institute under the Chinese Academy of Social Sciences: "The Reconstruction of the Microeconomic Base--More on Problems and Trains of Thought in the Further Reform of the Chinese Economy"--completed February 1986]

[Text] People's most basic understanding of the issue of the reform of the economic structure often begins with looking at the defects of the traditional model of economic movement. However, following the deepening of reforms, the necessity to reform the ownership base is raised, independent of man's will.

1. The Central Link in the Reform of the Urban Economic Structure

The Obstacles To Meshing and the Loss of Balance.

At the end of 1984, in the expansion of our nation's overall demand, expansion of consumption was the major leading factor. The expansion of consumer funds played an accelerating role in investment inflation and the overheated growth of the economy. The emergence of this situation was directly related to the haziness of property relationships after the changing of movement mechanisms. State ownership, represented by state-owned enterprises, was originally very closely linked with the centralized system of unified receipts and expenditure. Now it has been required to "mesh" with the market mechanism, and naturally much friction has been produced. Seen from this angle, a more important reason for the shortfalls of the traditional socialist system than the ossified pricing system is actually ownership relationships.

The ownership problem was very sharply brought out when the reform of the urban economic structure was just commencing. This is fortunate for China's reform of the economic structure. The ownership problem is, in essence, a structural problem of the microeconomic base. In the traditional system it was manifested as soft restraints on enterprises' budgets. Soft restraints on budgets was first brought out as an issue by the Hungarian economist Kornai in summing up the many aspects of economic movement. However, because the angle from which he summarized the problem was too broad, he was unable to find a solution to the problem. In fact, the basic reason that traditional socialist enterprises had soft budget restrictions in various respects was the soft restrictions in terms of property relationships. That is, the boundaries of the property and interests of the socialist enterprises, as individual enterprises, were not clearly stipulated. Thus, the central link and basic task in the reform of the economic structure is to proceed from the property relationship and reconstruct microeconomic organizations.

The typical situation under the traditional system is: Some enterprises have handed profits to the state amounting to tens of times the value of their own assets, but their production conditions are still backward, while the losses of some enterprises are sufficient to build several factories, and they are still doing well. The seriousness of the problem lies in the fact that after 7 years of economic reforms in China, there is still little relationship between the profits from the assets of an enterprise and the profits they actually retain.

It should be affirmed that development in leaps and bounds has been achieved in respect of having the movement mechanisms changing tracks during China's reform of the economic structure, and that the movement of economic systems has begun to be conditioned by market demand. However, as property relationships are, in general, still the same as before, the originally imbalanced process by which the economy is being monetized has been increasingly slanted through development. The coverage is very broad while the swiftly developing commodity market and the uncompensated and unbalanced fund factors form a movement which is greatly uncoordinated. In economic activities, the market restrictions (production restrictions) are tending towards hardness, while budgetary restrictions (investment restrictions) are still very soft. Enterprises are beginning to respond to market demands, but the reaction is either not economic or else it has very low efficiency. The industrial situation in society can be speedily readjusted in a short period, but it is difficult, even in the long term, to achieve an improvement and balance in the structure of the necessary natural resources. The ability of enterprises to develop potential, innovate and improve quality is very low. Their reaction to macroeconomic regulation signals is weak or even negative, making macroeconomic regulation very difficult. Clearly, the major contradiction in the further development of Chinese economic structural reforms is the friction and conflict between an economic movement model which involves dramatic track-changing and an ownership base which has changed little.

Several Attempts at Directional Reform.

One way is by changing the ownership relationships. An important method for improving microeconomic activities is by promoting the mixed development of various ownership components, so as to realize the diversification of the ownership structure. However, initial practice has shown that while the economic relationships of state ownership are basically unchanged and state-owned enterprises still lack vigor, when the ownership structure is diversified, the other economic component operators reap rich profits, producing disparities in social income and unrest among the people. With the state-owned economy, this often results in public things being used for private purposes and in the expansion of consumption. When various state-owned enterprises implemented experiments in leasing or in workers becoming shareholders, in the allocation of income the enterprise's state-owned funds were placed outside divisible profits. State-owned funds equals uncompensated funds. Through the years practices have become habits and such habits have reached the stage where they are very difficult to change.

Another flexible method by which it seems it will be possible to avoid large reforms is fund payments [zi jin fu fei 5261 6855 0102 6316]. It is generally believed that this can eliminate discrepancies between enterprises in terms of the funds they are equipped with, and raise the efficiency of fund use. However, because there are great disparities in the level of profits of the various areas and various industries, and even between particular enterprises, fund payment cannot be widely implemented. Behind these seemingly coincidental factors, there is concealed a profound mechanism of the commodity economy: The assets of an enterprise are its entirety, and their value or price is not determined by the amount invested in them initially. Rather it is determined by the productivity, that is the rate of profits, they realize. The latter determines the replacement cost. This is the process of asset appraisal which occurs every day in the modern commodity economy through the fluctuation of enterprises shares' prices and the sales of these shares. If this type of asset pricing departs from the movement of asset value (or net value) and is fully developed, in the environment of China where the land is broad, the levels of economic development uneven and the investment environment widely disparate, it will result in a great deviation in our nation's actual asset and investment structure. This will be manifested in the fact that even if the regional cost differentials are eliminated, asset revaluation will be considerably greater in most of the regions on the eastern coast and in several cities and areas in the western regions where transport is convenient and the population is centralized. Meanwhile, the assets of enterprises in the majority of the western areas, and especially in third-line enterprises, will be greatly devalued. In this situation, if we require everyone to make payments based on the original value or the new value of assets, we are sure to run into a brick wall.

Thus, the basic drawback of fund payments is that it completely mixes together the responsibilities and rights of the investment decision-makers and the asset users. In fact, it requires that the enterprises take on unconditionally, the entire risk of the state's investment decision-making. This will continue to give rise to softness in enterprises budgets. The payments are thus just a way of replacing old inequalities with new inequalities.

Reconstructing the Microeconomic Base--Inspiration From Rural Reforms.

Strictly speaking the production responsibility system in the rural areas is not a contract for production volume, but for land. Following the development of the commodity economy, there also appeared land transfer contracts. Thus, it is a land contract or operational responsibility system. The first step of land contracts is to make an overall assessment, within the production team, of the fertility of the plots, their distance away and such factors. From this, the production volume contracts can be fixed. The land contracts also gave rise initially to the short-sighted actions of plundering fertile plots. However, as the land contract periods were extended, while absolute rent was the state's, differential land rent was one's own, and the peasants' actions gradually tended towards the long-term and rational. In rural reforms, the family has replaced the production team as the operational unit, while land contracts have replaced work-points. Thus there has been a complete restructuring of the microeconomic base. This is where its success lies and is also its major experience.

The urban reforms are far more complex than the rural reforms and far more difficult. The 3d Plenary Session of the 11th CPC Central Committee took a decision that there should be an appropriate separation between the ownership of an enterprise and the right of operation. However, an effective form by which this separation can be realized has not yet been found. During the practice of the reform of the urban economic structure, people have come to gradually recognize that with assessment based on growth of the base, and equal distribution within each enterprise, there is no horizontal comparisons between enterprises or social evaluation. This inevitably results in the fast oxen being whipped and there being no clear division between rewards and punishments. Some have even implemented director responsibility systems, but if the integration and increase of the enterprise's assets are not included in the goals for the period of tenure, the responsibility system will be a mere formality. Thus, we must take assets into consideration when assessing enterprises. International experiences also show that in a modern commodity economy the assets earning method allows that, after ownership and operation rights are separated, the interests of the owner (or the legal owner) are guaranteed, and also provides the operator (or economic owner) with a form which allows full activity over a wide area. Thus, the reform of the urban economic structure must be based on the special patterns of urban reform, must center round assets as the core, and reconstruct the cells of microeconomic activities--enterprises.

2. Asset Operation Responsibility Systems

Proceeding from the property relationship, and thoroughly resolving the problems of soft restrictions and big pots in socialist enterprises is an issue which up to now socialist states have not resolved or even correctly addressed. The asset operations responsibility system which is a summary and refinement of the practice of China's economic structural reforms, is only a breakthrough in the right direction, and is far from being a final answer to this question.

The asset operations responsibility system includes the three basic components of asset assessment, income-sharing and operational responsibility. Assets assessment is the carrying out of market-simulation and social assessment of the enterprise assets formed through state investment decision-making. The aim is to resolve the contradiction of deviation between the actual effectiveness and the nominal value of existing assets. The method is: 1. An appraisal of existing enterprises assets is made using net asset value as the main yardstick. Those enterprises in which, due to early investment decisions and other factors, the actual value of the assets seriously deviates from their net value, can revise their fund profit rates and equipment utilization rates, which have existed for many years within that enterprise. As to that machinery and equipment which have a replacement value, then it is possible to calculate solely on the basis of replacement value, and gradually combine asset assessment with the engagement of enterprise leaders through tendering. 2. After all newly-added assets formed through state investment have been assessed, they will, through tender, be taken on by the enterprise and the investors will receive the income from, and take on the risks of, investment. The newly-added assets formed through investment decided on by the enterprise will be entirely counted as the enterprise's state-owned funds, while the loss or profit resulting from the difference between the nominal cost and the actual cost will be taken on by the enterprise. 3. The assets assessment must be combined with the transformation and reorganization of the enterprises' organizational forms. During the assessment, the state must use a fresh method of rewards and punishments to foster specialized enterprises and enterprise groups, and enterprises which meet the economic demands, as well as readjusting the scale of enterprises and coordinating their structures. Income-sharing refers to the state's unconditional legal ownership of state funds and their added value. On this basis, the income from all state funds will be divided. Its contents are: 1. The unified profit rates set down for all enterprises to hand over will be the state's stable share of income. Before the reform of the pricing system is completed, the state can stipulate different rates of sharing for different industries. 2. The state's rate of profit share should be revised periodically in accordance with changes in profit rates for funds in society (or industry) and should be a major means of regulating the macroeconomy. 3. The state's share of the profits is in essence profits derived from funds, and should have a certain elasticity, in order to accord with the risks undertaken by the enterprise operators and the situation in the investment cycle. However, when an enterprise delays handing over part of the profits, then interest should be paid thereon. It may also be necessary to detain the enterprise's funds (for example, the depreciation, bonus, and welfare funds), and to return them only after the enterprise has handed over the profits. Operational responsibility refers to regulations in terms of the rights and responsibilities in using assets after the assets assessment and the sharing principles have been established. It includes: 1. The appointment and dismissal of enterprise leaders. Their incomes must be linked up with the results of the operation of assets. 2. Enterprises will have autonomy in the use of funds, and will be able to independently decide on the investment direction of the enterprise's accumulation funds. They will also be able to sell off existing assets. However, the increased value of the assets resulting from changes in the assets replacement value should be recorded in the account for state-owned funds. 3. Abolition of regulatory tax system and of credit repayments before paying tax. As to those enterprises which can completely realize their profit accumulation, but cannot guarantee the state's income share, then in accordance with previously stipulated procedures, the enterprises' bonus and welfare funds will be used to offset the amount. They might be forced to hand over depreciation funds, or wage funds could be deducted. The enterprises might even be ordered to reorganize, merge or transfer.

After the asset operation responsibility system is implemented, the government's economic management function will have to undergo appropriate readjustments.

It may be possible to establish, under the Ministry of Finance, a State Asset Management Bureau. The right of the state to directly interfere with state-owned funds will be centralized in the asset management departments. All levels of asset management departments will be fully responsible for the integration, increase of, and income from, assets. They will also have the final decision-making power in respect of the employment and dismissal of enterprise leaders. The security of assets and their earnings rates will be decided on by unified standards in the assets management system. It may also be possible to consider setting up asset management departments on the basis of economic regions, and they may then entrust the assets they manage to enterprises, enterprise groups or specialized investment companies to operate. Overlapping and competition between operations will be permitted. The asset management departments will be responsible to the financial departments and will be supervised by them. In order to link up with the existing system, division of work can first be carried out at the various levels of existing management departments. One side will be responsible for administrative matters and industry management, while the other side will be specifically responsible for the management of assets. In accordance with the asset operations situation, the appointment or dismissal of the enterprise leaders will be decided upon. Later, the various regional asset management department departments will be gradually merged. Because of the fluidity, compatability and expansiveness of asset property rights, the asset managers and operators will, internally, be able to cross the restricting borders imposed by divisions between departments and regions. In this way, we can look forward to establishing, with financial relationships as the link, a new conduction mechanism and a new standard for effectively conditioning enterprises' activities.

The main functions of the assets operation responsibility system are: 1) Through asset appraisal and tendering, the umbilical cord by which enterprises are attached to the big pot of the state will be cut. 2) Assets earnings will be the only yardstick for handling the distribution relationship between the state and the enterprises, and will stabilize the enterprises' activities. 3) It will reduce investment starvation. The root of investment inflation is unpriced assets and the uncompensated use of assets. The asset operation responsibility system will clarify the state's share of an enterprise's post-tax profits based on the enterprise's use of assets. Thus it will provide a firm measure by which to avoid investment hunger. 4) The security, rate of added value and the amount of income from assets will be used as selection criteria, and will provide an important standard in the assessment of entrepreneurs. This will result in entrepreneurial dedication, the spirit of blazing new trails and the profit motive being unified with state interests. Thus, in fact, changes in economic conduction mechanisms will result in state-owned assets having dependable representatives, and a calm and collected revolution will be carried out in the system of appointment and dismissal in the spheres of economic activity. 5) It will fix economic responsibility. The major flaw in previous responsibility systems is that they overlooked the enterprises' most basic responsibilities in respect of assets. Through the correct and unerring yardstick of fund profit rates, the asset operation responsibility system decides questions about enterprises' development and existence. This will result in the income of entrepreneurs, and staff and workers, being linked, to varying degrees with fund earnings, and will concretely manifest the enterprises' operational responsibilities.

The more long-term significance of the changes resulting from instituting the asset operation responsibility system is that the activity motives of the reconstructed microeconomic organizations will cause the enterprises to shift from trying to use the greatest share of resources, to trying to realize the greatest income from their resources. This will allow socialist enterprises to act in the best possible way in market movement. The asset operation responsibility system means that competing socialist enterprises, if they are to maximize their total earnings, will have to readjust the two aspects of input and production, so as to really achieve a level where marginal income is equivalent to marginal costs. This will guarantee that this level will stabilize in the areas where average costs are lowest. At the same time, by using a unified yardstick for the general profit rate in society, it will allow enterprises to completely shake off the bonds of planned production value and contracts for profits. It will at once, greatly spread out the level of retained profits in different enterprises within the same industry. This will promote the flow of funds from low to high effectiveness areas. This will create material conditions for advanced enterprises to speedily develop and annex others, while backward enterprises will wither and be reorganized. It will thus provide a base for the rationalization of microeconomic activities.

In order to better understand the function of changing the property relationships, and its position in the system of economic structural reforms, it is necessary to discuss the following related questions.

1. The asset management responsibility system and enterprise bankruptcy. Enterprise bankruptcy is the result of an enterprise being unable to meet its liabilities on time, and being unable to reschedule them. It is possible for a bankrupt enterprise to temporarily remain a profitable enterprise. Enterprises with potential may, after incurring losses, lose their capital but still not go bankrupt. Bankruptcy and enterprise losses are not equivalent concepts. The asset management responsibility system will allow the state, in a situation where there are no obstacles to the integration and increased value of assets or income, and there are no anxieties about prospects, to shift assets and avoid losses, in accordance with stipulated procedures. This is something a bankruptcy law will not be able to achieve. At the same time, the asset management responsibility system severs the relationship between enterprise operation and state investment decisions, and clearly delineates the boundaries of enterprises' asset relationships. More particularly, it provides an indication of whether enterprises' asset operations are good or bad, and creates conditions for handling bankruptcy in socialist enterprises.

2. The asset management responsibility system and the issuing of enterprise shares. The idea of implementing a system of share issues in a socialist state has, on the theoretical plane, provided people with much enlightenment. However, the issuing of enterprise shares and the external forms of our nation's current ownership system deviate greatly from each other and cannot be easily joined together. Thus, in actual life, it has not played a great role. At the same time, the share issue system is the general organizational form in modern western economies. If this system were to be transferred to a socialist nation, then great changes would be necessary both internally and externally. The comrades who propose this also have greatly differing ideas. If the

issuing of enterprise shares requires changing the leading position of state-owned economic components in the economy, then it is intrinsically different from the asset operation responsibility system. If the issuing of enterprise shares is intended to give different economic components a common external form, then it is only half a step away from the asset management responsibility system. This is because the latter opens the door for fund flow between enterprises under different types of ownership.

3. The asset management responsibility system and leasing. The asset management responsibility system is a special form of division between the state and enterprises in terms of the ownership and right of operation of assets, and between legal ownership and economic ownership. It is basically different from leasing. In leasing methods, the state actually hands over to the lessee economic ownership of the assets for a certain period. The latter is then responsible for the profits or losses of the enterprise. If an individual (including a factory director) leases the enterprise, there is no problem being responsible for profits. However, if the enterprise really incurs losses or suffers reduced income, the individual lessee will be completely unable to fully compensate for the losses. This asymmetry between rights and obligations is the economic root of why society looks askance at lessees obtaining high incomes. In the employment of enterprise leaders under the operation asset responsibility system, they are seen purely as operators. The income of enterprise leaders will not be like that of the peasants who "hand over what is required to the state, leave what is necessary with the collective and keep for themselves whatever is left over." Rather, it will be something which is decided on by the assets management department. This is consistent with the general trend towards separation of the two rights under modern production conditions (where operators are neither legal owners or economic owners) and customary practices.

4. The asset management responsibility system and the fund market. The functions of these two are different. The former resolves the problem of uncompensated funds within the enterprises, while the latter resolves the problem of the price of funds obtained externally by the enterprise. The former provides internal motive force for the external flow of enterprise funds, while the latter provides more unobstructed external conditions for this flow. Further, a complete fund market mechanism can only play a regulatory role in respect of the resources flow and will have little effect on the forms of resources storage. The latter forms a strong absorption mechanism: Uncompensated stored funds greatly engulf and assimilate flowing funds. However, all the preferential treatment and soft restrictions in terms of taxes, interest rates and credit repayment are certainly not just like dust which one can nonchalantly flick away. Rather, they are natural extensions of the gigantic storage function. Seen from another angle, only when key market-distributed resources depend on the conditional variables provided by enterprises in respect of the productivity of the key factors, will market allocation and regulation be realized. Capitalist economies developed, over several centuries, from the first appearance of shares to the common issue of shares, and then to integrated financial markets. In this sense, an asset operation responsibility system, or a more general system of establishing a relationship in terms of earnings by an enterprise's assets, is an historical and logical precondition for the development of a financial market.

5. The asset management responsibility system and the adjustment of the industrial and enterprise structures. In a modern economy, the industrial structure changes very quickly, and the scale and structure of enterprises is also often changing. On the one hand, there are small enterprises being produced continually and being divided and going in different directions, while on the other hand large enterprises are dividing and merging. The reason the economic structure can continually move in accordance with market, technological, and economic demands, has, as a background, the flow of funds (including enterprise asset storage), and is because asset property rights are continually being rearranged and reorganized. Both our industrial and enterprise structures are irrational, but this cannot be changed, because once funds flow into enterprises, they solidify. If this problem is not resolved, then the overall economy will be in difficulties, and there will be no hope for the development of specialization or horizontal economic relationships. The key to breaking through this deadlock is to establish a system of assets-earning, so that enterprises will seek profits from funds. In this way, the innate system of balance within the economic structure can be mobilized. Although pricing reforms can start the process of self-adjustment of the industrial structure, if we want the industrial structure to draw close to the demand structure, and particularly to realize the rationalization of the enterprise structure (including alignment of scale and of specialized coordination), the only way is to rely on the flow of asset property rights and on reorganization.

6. The asset management responsibility system and macroeconomic management and control. The former provides a necessary microeconomic base for the latter. In the process of streamlining administration and handing down power, the reason the old administrative methods and mechanisms cannot be "streamlined," apart from the inertia and resistance of the traditional systems, is the abnormal activities of the microeconomic organizations. By proceeding from the asset operation responsibility system in correcting the activities of the microeconomic organizations, many administrative organizations and functions will lose their basis of existence. At this time, the obstructions to further sorting out and reforming the administrative organs will probably be quite small, and then it will finally be possible to achieve flexible, light and highly effective macroeconomic management.

7. The position of the asset management responsibility system in the historical process of reforming the economic structure. The asset management responsibility system (or other forms of asset management and earnings systems) is the take-off point for the economic system in rebuilding property relationships from the old to a new model. The links of the qualitative change involve: 1) A simulated social assessment of the inventory assets formed under the traditional economic system. This assessment cannot be carried out in the market, but neither can it be artificially determined completely divorced from the market. 2) The yardstick of profit margins determined by horizontal commodity economy links will replace the system of vertical distribution (including vertical profit growth). Also, the asset operation responsibility system is a transitional link, connecting what went before and what comes after in the overall process of reform of the economic structure. It is an historic intermediary, as the economic system moves gradually towards excellence.

3. Renewed Readjustment Through Having Distribution Stimulate Structural Reform

Forms of distribution and distribution relationships are manifestations, on the economic level, of ownership systems. Therefore, a structure with microeconomic ceels which do not have fixed divisions based on distribution relationships is incomplete. The asset operation responsibility system can set down external boundaries in the asset relationship between an enterprise and the staff and workers. Here are a few points and ideas on this seen from the angle of first stage urban reforms.

From 1978-1984, if we ignore price rise factors, the average per-capita income of the nation's urban population rose 22.3 percent, while the average income increase across the nation was 25.3 percent. However, at the same time as the people's standard of living in both urban and rural areas across the nation has risen in a sustained and marked way, the phenomena of individual incomes being unequal has occurred in many economic activities, and this has angered some people. This, it seems, cannot exceed expectations. It is also clearly a trifle stupid to explain this by saying that the dramatic changes in relative income levels gave rise to this social mentality. Relative changes in the economic income structure clearly can result in people having difficulties adjusting. However, if these changes are regulated and accord with the basic interests of the majority of people, people will be gradually calmed as the period of readjustment continues. If on the contrary, these changes are without order, or the inherent opportunities are clearly unequal, the complaints will accumulate and they may eventually give rise to prickly social problems.

The Flow of Labor in China.

Possibly, a basic measure for resolving the above problem, is the free flow of labor. Seen from the situation in the various countries of the world, a labor flow of approximately 15 percent will not normally bring about fluctuations in the economy, and has the benefits of clearly raising laborers enthusiasm for work, spreading technological skills, changing the situation of work being too specialized, and increasing productivity. However, like other socialist countries which have implemented traditional systems, the manifestations of China's labor flow are different from the rest. The labor force elements have strange characteristics. These are that their lack promotes labor flow (the obstacles to retrenched staff are few and the choices of workers are quite numerous) while their surplus obstructs labor flow (the staff reserves can, to a large degree, satisfy the demands made for changes in the labor force). This, we are afraid, has already become a very common situation in the labor flow of the Soviet Union and East European countries. It is also the basic reason why even now, it is difficult to have labor flow among the urban population in our nation. Seen from this angle, the establishment of a labor flow mechanism will perhaps be an added difficulty in China's economic reforms. If we consider the following two points this is even more so:
1) Considering the congealed nature of labor flow in China's cities, the labor flow will practically have to start from nothing. The danger of marginal labor flow is that it allows those lucky few who can change jobs to obtain especially favorable rewards. This produces strong contrasts and social repercussions and amplifies the role played by labor flow. 2) The flow of labor is related

to certain social, economic, cultural and mental factors. Thus, its trend of development has certain qualities which cannot be opposed. China is a developing country and at present, in promoting labor flow, we can travel in various directions and feel a little hesitant. According to current international statistics, the relationship between the rate of labor flow and labor cost is not clear. For example, in various countries where the degre of labor flow is quite high, the increase in money wages is quite rapid (for example, in Yugoslavia). Conversely, in some countries where labor flow is quite low, the cost of wages as a percentage of the total cost of commodities is quite low (for example, Japan over quite a long period). These different considerations compel us, when promoting the flow of labor, to be very careful to avoid stimulating the rise of labor costs.

Further, in the traditional system, rural residents, who constitute over 80 percent of the total population, have since the founding of the country, had the power to change jobs, and in many urban enterprises there has always been a sizable number of peasant workers. These facts show that in China the potential for labor flow, from beginning to end, lies in using a dual system. Since the beginning of economic structure reform, the pace of the flow of labor towards the cities has greatly increased, and this has played a positive role in economic development. However, in the cities where there still exists the situation of great numbers who are in jobs but under-employed, and especially under the role of the rigidity of the urban population's standard of living brought about by historically-created disparities between urban and rural life, as rural labor flow to these cities is generally for the purpose of obtaining higher income, we must it seems, face the dilemma of a great increase in the overall amount of consumption funds, or a large amount of unemployment among the urban population.

In addition, China's urban labor flow still has a number of specific problems. According to investigations, the present areas in society where the flow is most pronounced are among high-technology workers and experts, and among unskilled workers whose professional and social appraisal is quite low. The flow of these two types of people will indeed put pressure on income to move upwards. As to workers in the middle levels where the number of workers is great and the tendency to flow rather weak, if we are to have them flow then we need to adopt compulsory staff reduction measures. This must await the establishment of a complete social security system. At the same time, while the benefits brought by the reform of the economic system itself do not have the unconditional support of the people, whether the adoption of those measures which elicit strong social reaction is prudent, is worthy of study. In any case, from now on, on the basis of gradually transforming and perfecting a social security system, instituting a system of reasonably short employment contracts for all newly-added urban employees and, as conditions become ripe, unobtrusively and gradually reducing the amount of fixed employment and replacing it with contract employment, so as to achieve the flow of labor, seems to be quite in accord with our national conditions.

Using Distribution To Stimulate Structural Reforms.

The three basic differentials between enterprises--product price, economic and geographical environment, and the extent of assets used--have not been, and cannot be, quickly eliminated. Thus, while income from various non-labor production factors has not been separated from the enterprises' operational income, there will be no distribution and stimulation method which can be universally implemented to achieve "rewards according to labor," or which is in accordance with "rational principles." Further, as long as the important factor of labor is still unable to flow freely, any method which directly links up individual income and the results of enterprise operation, or other methods which space out the differentials between individual incomes will inevitably contain serious social unfairness. International experiences have shown that any rash act in respect of the distribution of individual incomes may reverse the overall reform process. Thus, changing the major train of thought of the early reform period which held that differentials in individual income distribution should be expanded, is a basic link in striving for the overall initiative in economic structural reforms.

It seems that in the first stage of the urban economic reforms, it is perhaps appropriate to get rid of the method which links an enterprise's wages with results, and restore strict controls on enterprise wage funds and other consumption expenditure. Also, except on a small number of clearly delineated bonuses for economizing, there should be a high-speed progressive bonus tax for strictly controlling enterprise's bonuses. In respect of all income, apart from resident's wage income, we can immediately implement individual income tax with a low cut-in point and high-speed progression (we can exclude the social insurance portion). This will force the reduction of excessively high individual incomes. Adopting this method of going backwards in order to advance in the individual income area, can eliminate for the reforms in other areas, the fear of trouble at the rear, and they will be able to progress with great steps. As the overall reforms are pushed forward, the reform of the individual income area will easily follow.

The major basis for discarding individual income distribution is that the modern individual is not generally the main part of production and operations. Individual labor must melt into enterprise aggregate labor, as only thus can it become a source of social wealth. The first of the economic development motive problems which the economic reforms must solve is enterprise or entrepreneur motive. That is, an enterprise with high rates of profits will have much in production funds. The enterprise can thus quickly expand, its market share will grow and the scale of the enterprise will increase. Those enterprises with low profit rates will have few or no funds. Thus, the enterprise will be stopped, will wither and may even close down. For a time, we have given too much attention to the relationship between the income of the ordinary workers and the enterprise results. There is no ratio between the rate of profit realized by an enterprise and the profits it retains. In many cases, various enterprises which produce the same type of product, but have different production costs, retain about the same amount of profits. This results in mutual suppression and no one can progress. However, because of exemplary efforts and emulation factors, workers retained profits and workers' average bonuses are daily becoming more equal.

In motivating the production enthusiasm of individuals, we must still proceed from basic wages. The major reason the masses are not content at present, apart from incomes being unequal, is increased costs. Greater bonuses also give the people a feeling of undependability, but the bonuses are only given to some people. However, the shouldering of price rises firmly falls on all people. Thus, it is necessary, on the basis of the degree of price rises, to give staff and workers wage compensation. In supplying compensation, and in raising actual wages, a system of general wage readjustment for all staff and workers can be adopted. Our nation's experiences in the 1950's show us that when actual wages increase in a universal and stable manner, people are vigorous and zealous, and this is of benefit to economic development and social stability.

Actually, in future target models, it appears that workers' income cannot be completely linked up with the great fluctuations in profits. This is because, despite the fact that bonuses and an enterprise's profits are closely linked, as far as workers are concerned, bonuses are only a highly uncertain short-term income. Thus, these bonuses only stimulate workers in short-term actions. The staff and workers are more concerned with the position and development prospects of the enterprise, as well as their individual position, duties, the degree of confidence placed in them and even their opportunities for promotion. The improvement of the quality of an enterprise depends on the quality of each worker, and primarily depends on the improvement of their technological levels and their operational capabilities. Thus, the major avenues for motivating individuals in their long-term activites is to strengthen the relationship between the development prospects of the enterprise and individual benefits, and by generally implementing a system of work assessment and promotion. Separating the operator's benefits from the general benefits of the staff and workers is another thread in the reforms at the submicroeconomic level. In the practice of the traditional system, hypothetically it was all workers who had the spirit of masters and they were all directly responsible to the state. As this departs from the reality of the current socialist period, the results in practice were not good. Giving operators an appropriate position and necessary rights and interests is an inevitable trend in economic reform. However, given the background of China's long period of feudal society and the infiltration of the ideas of privilege, in the early period of reform, we should not abruptly increase the differentials between the incomes of operators and ordinary staff and workers. Much less can we give operators the right to reward and penalize themselves. The major measure for stimulating operators, that is the entrepreneurs, is to link their destiny with that of their enterprise, so that the success or otherwise of the enterprise and the individual interests of the entrepreneur are both determined by the situation in the operation of assets. If the asset operation is good, the enterprise will develop quickly, a small enterprise will become a large enterprise, and a small entrepreneur will become a large entrepreneur. If the reverse is the case, the enterprise will be closed down and the entrepreneur will lose his position. It may also occur that in accordance with the stipulations of the entrepreneurs' association, he will not be able to take on a new post within a certain number of years. At the same time, we must implement a dual-channel system for income. That is, the bonuses of the enterprise leaders and the current income of the enterprise should be unhooked from the workers' reward funds. Meanwhile, the entrepreneurs income will be decided upon by the asset management department in accordance with assets' earnings and the tapping of latent potential. This will foster a devotion and a sense of honor among the entrepreneurial strata and gradually form socialist China's entrepreneurial contingent and entrepreneurial spirit.

The question of income distribution in publicly-owned enterprises has three key links: 1. The fixing and changing of basic wages. This problem has been discussed above. 2. The total amount of profits to be retained by enterprises. This will be decided on in accordance with the profit (rate) achieved by enterprises through reforms of market movement mechanisms and the asset operation responsibility system. 3. The proportions of profit retained by the enterprises to be used in accumulation and in consumption. At present, there is a unified proportion stipulated by the state, and then bonus taxes are levied. After the asset operation responsibility system expands the differentials between the total retained profits of various enterprises, this expedient measure should not be used at all. A feasible method is, in accordance with the ratio between funds used by the enterprise and its wage funds, to appropriately divide the enterprises' retained profits into accumulation and consumption funds. The total amount of profits retained will be determined by the profits, while the consumption funds of the staff and workers will also be stipulated in accordance with internal proportions. This will form dual regulation, and thus if an enterprise wants to increase the individual consumption of its staff and workers, it will either have to expand the amount of profits realized or reduce its use of funds. In this way, we can look forward to income distribution with balanced production factors, which will finally lead to the rationalization of enterprises' activities.

The train of thought on reform put forward in this article is only a hypothesis, untested through practice, and is certainly not the final answer to the problems. The aim is to try to get people to pay further attention to, and engage in, further research on the major questions of economic structural reforms, and their relationships and sequence, as this will help in achieving real progress in the structural reform of China's economy.

(Authors remarks: Comrades Zhou Qiren [0719 0366 0088], Ji Xiaoming [0679 1420 2494], and Peng Zhaoping [1756 3564 1627] provided very valuable ideas on an earlier draft of this article.)

HEBEI VICE GOVERNOR ON SEVENTH 5-YEAR PLAN

SK230400 Shijiazhuang HEBEI RIBAO in Chinese 6 May 86 pp 1, 2, 3

["Report on the Seventh 5-Year Plan for the Hebei Provincial Economic and Social Development," delivered by Vice Governor Li Feng at the Fourth Session of the Sixth Hebei Provincial People's Congress on 25 April]

[Text] Fellow deputies:

Entrusted by the Provincial People's Government, I now submit a report on the Seventh 5-Year Plan for the Hebei Provincial Economic and Social Development for examination by the present session.

It took us more than 2 years to draw up the province's Seventh 5-Year Plan. On the whole, the drawing-up of this plan can be divided into three stages. At the first stage, from February to August 1984, in line with the magnificent goal set forth by the 12th Party Congress, we organized the departments and specialists concerned to discuss the provincial situation and the strategy for development, and to draw up the strategy for the economic and social development by the end of this century. At the second stage, from September 1984 to September 1985, on the basis of the discussion on the provincial situation and strategy and in line with the plans of various prefectures, cities, and departments, we conducted investigations and studies, analyzed the situation on the economic and social development, summed up the historical experiences, emphatically studied the major problems which should be solved during the Seventh 5-Year Plan period and the ways to solve these problems, draw up the outlines of the Seventh 5-Year Plan, set forth the guiding ideology, major tasks, fighting goals, strategic priorities, economic distribution, and countermeasures for the Seventh 5-Year Plan, and designed the frame of the overall ideas. At the third stage, from October 1985 to April 1986, in accordance with the "Proposal of the CPC Central Committee for Drawing up the Seventh 5-Year Plan for National Economic and Social Development," we revised the outlines of the Seventh 5-Year Plan, conducted overall balancing, and drew up the (draft) Seventh 5-Year Plan.

The (draft) Seventh 5-Year Plan, submitted to the present session for examination, has already been printed and distributed to you. Here, I will make some explanations of the implementation of the Sixth 5-Year Plan, the basic tasks for the Seventh 5-Year Plan, the economic structural reform, and the several points of work necessary for achieving the Seventh 5-Year Plan.

1. Implementation of the Sixth 5-Year Plan

During the period of the Sixth 5-Year Plan, our province conscientiously implemented the CPC Central Committee's principles of "readjustment, restructuring, consolidation, and improvement" and "invigorating the domestic economy, and opening up to the outside world," thus achieving great results in the national economy and on all fronts. Most of the tasks and targets formulated by the Sixth 5-Year Plan have been fulfilled or overfulfilled, and profound changes have occurred in our economy and society.

During the Sixth 5-Year Plan period, the province's national economy has developed in a sustained, steady, and coordinated manner, and the economic efficiency has raised somewhat. In 1985 the province's total social product amounted to 7.346 billion yuan (calculating in terms of the present price), an average annual growth rate of 9.6 percent (calculating in terms of the comparable prices). Of this, the total agricultural output value (excluding rural industries and the industries run by units below the village level) came to 1.646 billion yuan, an average annual growth rate of 10 percent, and greatly surpassing the average annual growth rate of 1.3 percent during the Fifth 5-Year Plan period. The total industrial output value (including rural industries and the industries run by units below the village level) was 4.297 billion yuan, an average annual growth rate of 10.6 percent which was higher than the rate of 8.7 percent during the Fifth 5-Year Plan period. The national income was 3.294 billion yuan, showing an average annual growth rate of 9.8 percent, surpassing the rate of 8.3 percent during the Fifth 5-Year Plan period. In the first 2 years of the Sixth 5-Year Plan period, the financial revenues paced up and down, but in the latter 3 years, it has witnessed a steady increase. In 1985 the financial revenues amounted to 4.515 billion yuan, an average annual increase of 5.2 percent. This indicates that our province has already basically fulfilled the task of effecting a fundamental improvement in the financial and economic situation. The proportions and relations between the major sectors of the national economy became more rational, and the accumulation rate dropped from 33.2 percent during the Fifth 5-Year Plan period to 30.4 percent. The structure of agriculture, light industry, and heavy industry was improved somewhat. The proportion of agriculture in the total dropped from 29.1 percent in 1980 to 27.2 percent in 1985, that of light industry dropped from 32.8 percent to 35.1 percent, and that of heavy industry dropped from 38.1 percent to 37.2 percent. The tertiary industry developed rapidly and its proportion in the gross national product rose to 21.3 percent. Along with the coordinated development of the economy, economic efficiency also increased to some extent. In 1985 the province's per-capita income was 597 yuan, increasing at an average annual rate of 9.8 percent, and approximately doubling the average rate of 5.3 percent in the previous 28 years (from 1953 to 1980). In 1985 the local budgetary industrial enterprises made simultaneous increases in output value, profit, tax, and financial income. The social labor productivity reached 1,345 yuan, showing an average increase rate of 6.3 percent, and 2.8 percent higher than the average annual rate in the previous 28 years. The utilization rate of the whole people-owned fixed assets rose from 68 percent during the Fifth 5-Year Plan period to 82.2 percent. The national income newly added from every 100 yuan of accumulation increased from 33 yuan during the Fifth 5-Year Plan period to 40.7 yuan. The energy consumption for each 10,000 yuan of national income dropped from 18.7 tons in 1980 to 16.1 tons in 1985, saving a total of 6.3 million tons of standard coal in 5 years.

During the Sixth 5-Year Plan period, profound changes occurred in the province's rural economy. In 1985 the total social product in the rural areas of the province amounted to 3.109 billion yuan, doubling the 1980 figure, and its proportion in the total social product rose from 36.3 percent to 42.3 percent. In the past, the province's agriculture has developed slowly. From 1953 to 1980, the grain output increased by only 268,000 tons annually on an average. From 1965 to 1980, the cotton output stagnated for a long time. Thanks to the implementation of the guidelines of the documents issued by the central authorities, the enthusiasm of the large number of peasants has been fully mobilized; the development of agricultural production has been promoted; and the output of grain and cash crops increased substantially. In 1985 the gross grain output was 19.666 million tons, up 29.2 percent over 1980. Despite the reduction of growing acreage and the hit by natural disasters, the output of cotton still reached 629,000 tons, 2.5 times that of 1980. In 1985 the total output of oil-bearing seeds reached 869,000 tons, about 2 times that of 1980. In the past 2 years, our province has been sufficient in grain, and more than sufficient in cotton. This is an event of great significance in the province's history. In 1985 the output of dried and fresh fruits reached 1.653 million tons, up 95.6 percent over 1980. What is gratifying is the comprehensive increases in agriculture, forestry, animal husbandry, sideline production, and fishery during the Sixth 5-Year Plan period. In the total agricultural output value, the output value of the cropping industry increased at an average annual rate of 9.3 percent; that of forestry, 10.9 percent; that of animal husbandry, 15 percent; that of sideline production, 6.1 percent; and that of fishery, 5.3 percent. The proportion of forestry, animal husbandry, sideline production, and fishery rose from 21.6 percent to 24.2 percent. Town and township enterprises have developed rapidly, and have already become an important mainstay of the province's rural economy. In 1985, the output value of the rural industry, the building industry, the transport industry, and commerce reached 14.63 billion yuan, and the proportion of the rural industry, the building industry, the transport industry, and commerce in the total rural social product reached 47.1 percent. New headway was made in land reclamation undertakings. All the 32 state farms in the province made a profit. In 1985 these state farms netted a total of 43.5 million yuan in profit.

Certain results were achieved in supporting the poor in the rural areas. During the Sixth 5-Year Plan period, the province allocated a total of more than 170 million yuan in relief funds, and 430 million yuan in supporting-the-poor funds to help some 552,000 poor households, of which more than 372,000 households eliminated poverty, and had sufficient food and clothing.

During the Sixth 5-Year Plan period, our province strengthened energy, communications, and raw material industries, thus increasing the strength for economic construction. Throughout the province, the investment in the fixed assets of state-owned enterprises totaled 22.85 billion yuan, of which 6.85 billion yuan went to energy industrial enterprises, showing an increase of 2.72 billion yuan or 60.3 percent, over the Fifth 5-Year Plan period. This investment helped to increase the power generating capacity by 1.27 million kilowatts, the coal production capacity by 7.96 million tons, the petroleum production capacity by 1.7 million tons, the oil refining capacity by 800,000 tons, the power transmission lines of more than 110,000 voltage by 2,080 km, and the power transformation equipment of more than 110,000 voltage by 3.67 million kilo-volt ampere. The investment of communications, transportation, and postal and telecommunications departments totaled 1.71 billion yuan, an increase of 630 million yuan, or 58.3 percent, over the Fifth 5-Year Plan period. During the period in question, 492 km of railways, and 879 km of roads were built, and the cargo handling capacity of the Qinhuangdao Harbor increased by 35 million tons. Investment in the building material industry totaled 1 billion yuan, an increase of 720 million yuan, or 360 percent, over the Fifth 5-Year Plan. This helped to increase the cement production capacity by 2.814 million tons, and the plate glass production capacity by 3.37 million weight boxes [zhong liang xiang 6850 6852 4360].

Our province witnessed new development in education, science and technology during the Sixth 5-Year Plan period. Attaching strategic importance to the development of education, science and technology, governments at all levels strengthened leadership, and increased investment in it. Education funds increased every year. During the period in question, they totaled 2.753 billion yuan, 81 percent more than in the Fifth 5-Year Plan period. Newly added student seats totaled 490,000, the number of colleges and universities grew from 30 to 50, and that of secondary specialized schools from 117 to 271. The number of students studying at local higher educational institutions (including those attending adult education courses) increased by 1.1 times, those studying at secondary specialized schools grew by 80 percent, and those studying at agricultural vocational schools increased by 3.51 times. A total of 190,000 people graduated from universities and secondary vocational schools, increasing by 45 percent over the Fifth 5-Year Plan period. During the Sixth 5-Year Plan period, 852 scientific and technological projects were undertaken, of which 766 were completed, yielding more than 780 million yuan of benefit. During this period, 1,797 scientific and technological achievements at the provincial level were scored throughout the province. Of them, 15 won the state invention award, 51 won the scientific and technological progress award, 12 won natural science award, and 46 were commended by the province or ministries. More than 68 percent of the scientific and technological achievements were applied. New progress was made in the development and application of microcomputer, bioengineering, and others. More than 40 achievements were scored in the study of the development of Taihang Shan. Of them, 16 reached advanced domestic and world levels. A new way to develop mountainous areas and help them achieve prosperity was explored, which was commended by the State Council. Notable results were achieved in opening up technology market. In 1985, the province organized scientific and technological trade on more than 2,100 occasions, with the total transactions reaching 590 million yuan.

During the Sixth 5-Year Plan period, our province increased the number of circulation channels, expanded the circulation spheres, and witnessed a thriving urban and rural market situation. The total number of urban and rural trade fairs throughout the province reached 2,477, an increase of 722 over 1980. Some 139 large trade markets were built. All provincial industrial goods wholesale centers were decentralized to cities and some 53 new trading centers of various forms were built. More supply and marketing cooperatives at all levels are being "run by the people," instead of the government which used to run them. A number of specialized service organs were established and some serialized service models emerged. Capital goods markets as well as technological and banking markets began to emerge. The retail sales of commodities rose substantially. If the price rises are factored in, the actual increase of total value of commodities purchased by the province's state and cooperative commercial units in 1985 was 54.3 percent over 1980. The total retail sales of social commodities showed an actual increase of 67.9 percent. The retail sales of commodities of the state, collective, and individual commercial units increased by 64.3 percent, 53.7 percent, and 24 times respectively over 1980, thus initially forming a circulation system characterized by various forms of ownership, various operational methods, and various circulation channels.

During the Sixth 5-Year Plan period, the incomes of the urban and rural residents in the province increased and their livelihood improved. Some 1.482 million job-seekers in the cities and towns were provided with jobs and the unemployment rate in cities and towns dropped from 4.4 percent in 1980 to below 1 percent in 1985. Along with the development of production, the incomes of the urban and rural residents increased. The average per-capita net income of peasants throughout the province was 385 yuan in 1985, showing a total increase of 89.2 percent in 5 years if retail price rises are factored in. The average per-capita income of the urban residents for their living expenses was 677 yuan. If the retail price rises are factored in, the total increase in 5 years was 35.4 percent. The consumption patterns changed remarkably. The number of high-grade durable consumer goods owned by families increased every year. The total savings deposits of the urban and rural residents reached 10.29 billion yuan, an increase of 8.18 million yuan over 1980. The housing conditions of the urban and rural residents improved. Some 20.84 million square meters of urban housing were built. This is an increase of 39.5 percent over the Fifth 5-Year Plan period. The average per-capita housing areas rose from 3.6 square meters to 5 square meters. In 1985, the average per-capita housing areas used by peasants reached 15.4 square meters, up 25.1 percent over 1980. The quality of clothing and food of the people improved fairly greatly. Never before has there been such a big substantial increase in the livelihood of the people throughout the province in a short span of 5 years.

During the Sixth 5-Year Plan period, our province made gratifying strides in opening to the outside world and establishing lateral economic cooperation, and achieved great development in establishing friendly contacts with foreign countries and carrying out cultural exchange. Our province has established friendship city ties with nine states, counties, and cities in foreign countries. In 1985, the province's total export volume of foreign trades reached $1.298 billion, an increase of 110 percent over 1980, showing an annual average increase of 16.5 percent. Fruitful achievements were made in the two international economic and technological cooperation and the export commodity trade meetings. During the Sixth 5-Year Plan period, the province as a whole approved 125 contracts involving 329 million yuan, of which $76.2 million was foreign funds. The United Nations as well as other international organs provided gratis assistance and low-interest loans involving a total of $118 million. We received a total of some 5,064 experts, scholars and lecturers from foreign countries and some 193,000 foreigners, overseas Chinese, and compatriots from Hong Kong and Macao. As our province's window for opening to the outside world, Qinhuangdao City scored initial progress in developing economic and technological cooperation with foreign countries. Our province succeeded in gradually strengthening economic and technological cooperation with the fraternal provinces, cities, and autonomous regions. At the 1985 invitational meeting on carrying out economic and technological cooperation with different places throughout the country, the province signed agreements with other provinces, municipalities, and autonomous regions on carrying out 705 economic cooperation projects, and 410 million yuan of funds were brought in from other places. According to incomplete statistics of nine cities under the jurisdiction of the province, 1,083 lateral economic associations involving 8,391 enterprises of more than 230 cities and counties of 28 provinces, municipalities, and autonomous regions were organized. More than 7,100 production units throughout the province established cooperation ties with more than 4,300 universities and colleges, scientific research and designing units, and large factories and mines in and outside the province, and 1,970 associations for linking production with scientific research were set up.

Greater progress was made in tourism. Many famous tourist scenic spots in Qinhuangdao and Chengde were renovated and reconstructed. During the Sixth 5-Year Plan period, the province received more than 105,000 tourists from foreign countries, Hong Kong, and Macao.

During the Sixth 5-Year Plan period, our province made great progress in broadcasting, television, press, publication, culture, public health, sports and family planning work. The rate of TV and FM radio coverage reached 80.9 percent and 61.9 percent respectively. Ninety-eight percent of the total towns and townships in the rural areas established cultural centers. A large group of specialized households in the cultural field emerged. Greater progress was made in public health undertakings. Over the past 5 years, 910 public health and medical organs and more than 25,300 sickbeds have been newly added. The incidence of some infectious diseases and some frequently occurring diseases decreased. The incident of endemic goiter was brought under control. Greater progress was made in preventing and curing endemic fluorine poisoning disease. Thus, the people's health conditions improved notably, and the sanitary conditions in the urban and rural areas improved greatly. Along with the flourishing development of the mass sports activities, a group of excellent athletic and sports teams emerged. The province ranked third in terms of the number of gold medals won in the First National Youth Sports Games. This was a major breakthrough in the Hebei Province's sports history. The natural population growth rate of the province was 14.2 per thousand thanks to the implementation of the family planning work.

During the Sixth 5-Year Plan period, the task for reconstructing the areas in Tangshan City hit by the earthquake disasters was basically fulfilled. Over the past 5 years, a total of 2.5 billion yuan of funds were invested in rebuilding the disaster-stricken areas, and the residential areas totaling more than 11 million square meters of floor space were built. As of the end of 1985, 215,000 families involving more than 788,000 people moved into new houses. In 1985, the industrial output value of Tangshan City was 5.166 billion yuan (not including the output value realized by the industry at or below the village level), showing an increase of 75.7 percent over that of 1975 when there was no earthquake. The 1976 earthquake had turned Tangshan into ruins. But today, a new Tangshan which extends broadly is towering aloft on the banks of the Bohai Sea.

We basically attribute the achievements made during the Sixth 5-Year Plan period to the implementation of the line, principles and policies set forth since the 3d Plenary Session of the 11th CPC Central Committee, the ideological and political act in unison with the central authorities, and the prominent grasp of reform.

In line with the actual conditions of the province, cadres at all levels were called on to emancipate their minds, expand their view, and pioneer the road of advance. Simultaneously, we firmly eliminated the wrong theory of "taking the class struggle as the key link," got rid of the obstructive thinking of "taking the grain as the key link" and the self-supporting and semi-self-supporting economy, fostered an idea that the socialist economy is the planned commodity economy, and vigorously developed commodity production, thus laying an ideological foundation for ceaselessly creating a new situation of reform and construction.

In developing our work, we persistently gave priority to the reform. In line with the arrangements of central authorities, the rural areas made an important step in reforming the unified and fixed state purchases of farm products and in readjusting the rural production structure on the basis of implementing the output-related contracted responsibility system. Focusing on invigorating enterprises, the urban areas carried out reforms in the spheres of production, distribution, and circulation, thus expanding the autonomy of enterprises in management and intensifying the self-renovation and self-development capacity of enterprises. Having broken with the monopolized management, unified purchases, and guaranteed and planned distribution, and commercial departments gradually transformed their circulation system into an open and multi-channel system with fewer intermediate links. The multi-functional role of cities was gradually brought into play. At the same time, the province carried out reforms in the fields of market price, wages, finance, science and technology, and education. All these reform projects vigorously promoted the development of productivity. However, we are inexperienced in carrying out these reform projects. Therefore, in the course of reform, in particular at the stage of replacing the old systems with new ones, problems are hard to avoid. Those problems that occur in the course of reform can only be solved through reforms. We should enhance our understanding through constant explorations and practices in order to gradually perfect our reform projects. We should carry out reforms, enhance our understanding, once again carry out reforms, and once again enhance our understanding. Through such a repeated and deepening process, we can constantly enhance our understanding and continually develop the reform.

In guiding the economic work, we always adhered to the ideological line of proceeding from reality in doing everything and seeking truth from facts, paid attention to going deep into the grassroots units to conduct investigations and studies, gave different guidances to different cases in different localities and trades in light of their respective nature, corrected at all times the method of demanding uniformity in everything, and called on all localities and departments to make a conscientious analysis of their situation, to exploit their own superiorities, and to take their own road of becoming prosperous.

In terms of work methods, we emphatically guided the overall situation by the method of using the typical cases to lead the road. We summed up and popularized the Shijiazhuang City's experiences in carrying out the collision-and-rebound type and comprehensive reforms, and experiences of Langfang and Baoding Prefectures in conducting the extensive discussion entitled "Quadrupling the Output Value and Striving for Relatively Comfortable Standards of Living," the "three visits" experiences of Baoding Prefecture, Tangshan City's experiences in exploiting the cities' function, and Handan City's experiences in developing the lateral economic ties. The popularization of these typical experiences have greatly promoted the work throughout the province.

During the Sixth 5-Year Plan period, our province scored great achievements in reform and construction. But some problems and latent unfavorable factors still exist in our work. Major indicators are: 1) In the course of carrying out the economic structural reform, we have failed to make an overall planning, and our reform measures are incoordinated. In the second half of 1984, the overly rapid growth of the consumption fund and the overly large scale of capital construction emerged for a time. Although we expeditiously adopted some measures to solve these problems, we should not treat them lightly. Owing to the different paces of reform in various fields and the obstructions to reform, some reform measures which had already been promulgated have not been carried out successfully. At present only one-third of large and medium-sized enterprises have really invigorated themselves, and most enterprises are backward in conducting self-renovation and self-development and in meeting the emergencies occurring on markets. In the course of correcting unhealthy trends, owing to the confused policy boundaries, the legal economic activities in some localities have been restricted, and some contracts cannot be honored. After the price reform was initiated, owing to the lack of experiences, we have failed to adopt coordinated measures, and have given insufficient guidance, thus leading to the inordinate increases in the prices of some foodstuffs. Although we strengthened the control over price hikes in the second half of last year which basically checked the trend of price hikes, latent factors for price hikes still exist because the total social demand still surpasses the total social supply. 2) Economic benefits from production and business were not high. With a low technological level, and backward scientific management, industrial enterprises in our province produced some goods of poor quality, and consumed plenty of materials. In commercial enterprises, marketing funds rose, and the turnover of circulating funds was slow. Some construction projects required long construction periods, and those commissioned amounted to a small part. Only 25 percent of the products produced by township enterprises were competitive in markets. 3) The agricultural foundation was rather weak, and destabilizing factors existed in agricultural production. Our successive good agricultural harvest over the past few years should mainly be attributed to the power of party policies, and science and technology. However, due to negligence of farmland improvement projects, reduced agricultural input, and poor service which failed to catch up, pump wells were out of repair; channels were seriously damaged; soil fertility declined; and arbitrary occupation of farmland was a common scene. In addition, the acute shortage of water resources of our province made our groundwater level drop every year. We should pay great attention to these unfavorable conditions affecting the sustained agricultural growth. Since 1984, despite our efforts to strengthen the work concerning poverty-stricken areas, some localities have yet to eliminate their poverty and backwardness due to numerous reasons, and the people in some remote mountainous and old revolutionary base areas still do not have adequate food and clothing. 4) Although the social conduct of our province showed improvement, it was far from being fundamentally improved. We should attach great importance to these problems and difficulties, continue to work hard, and carry out the work of this year and the entire Seventh 5-Year Plan period more conscientiously and successfully. We ask you, fellow deputies, to supervise our work.

2. Major Tasks of the Seventh 5-Year Plan, and Economic Structural Reform

The Seventh 5-Year Plan period is important to the fulfillment of the strategic objective of quadrupling the industrial and agricultural output value by the end of this century as set forth at the 12th National Party Congress, and also crucial to the changeover of the old economic system into the new. During the period in question, we should continue to conscientiously implement the policy of "enlivening the domestic economy, and opening to the outside world," carry out the economic structural reform thoroughly, and greatly facilitate economic construction and social development. In line with the general requirement for greatly expanding the socialist commodity development, gradually establishing a new economic system corresponding to our characteristics and full of vitality and vigor, and on the basis of the actual conditions of our province, the guiding ideology for the Seventh 5-Year Plan is: to give top priority to reform persistently, and make reform and development adapt to the local need to attach strategic importance to science and education development persistently, and promote the national economic development with high efficiency; to open to the outside world persistently, and further expand foreign economic and technological exchanges; to coordinate production and construction with the consumption for everyday life persistently, and fix an appropriate construction scale, and an appropriate degree of improvement in the people's living standards; and to greatly strengthen the building of the socialist spiritual civlization persistently while promoting the building of the material civilization.

After earnestly summing up the fulfillment of the Sixth 5-Year Plan, analyzing and studying the current situation of economic and social development, and taking into consideration the new factors of the Seventh 5-Year Plan period, and on the basis of the principle of being optimistic but not over-ambitious, the major tasks for our province's national economic and social development for the Seventh 5-Year Plan period are defined as follows:

1) We should push forward the overall reform of the structures of the economy, science and technology, and education, and continue to bring into balance the relations among various sectors so that the production relations can better suit the needs in the development of productive forces, and a foundation can be laid for a socialist economic system that is full of vitality and vigor.

2) We should strive to maintain the basic balance between the total social demands and the total social supply. On the premise of ceaselessly upgrading the economic results, we should ensure a sustained, steady, and coordinated development of the national economy. When calculated in terms of the 1985 price index, the province's total industrial and agricultural output value should reach 81.8 billion yuan by 1990, an increase of 37.7 percent over that of 1985 and an annual average increase of 6.6 percent. By 1990, the GNP should reach 53.4 billion yuan, an increase of 39 percent over that of 1985 and an annual average increase of 6.8 percent. A total of 184 billion yuan of national income has been arranged for use during the Seventh 5-Year Plan, an increase of 64.8 percent over that in the Sixth 5-Year Plan period. In the distribution of national income, a total of 130 billion yuan of funds has been arranged for consumption funds in the Seventh 5-Year Plan period, accounting for 70.7 percent of the total national income; and a total of 54 billion yuan of funds has been arranged for accumulation funds, accounting for 29.3 percent of the total national income. The investment in the fixed assets of the whole society in the Seventh 5-Year Plan period should be 55 billion yuan, an increase of 15.1 billion yuan over that of the Sixth 5-Year Plan period.

3) We should continue to readjust the structure of investment and the industrial structure, and to vigorously strengthen the construction of key projects, technological transformation, and intellectual development in order to prepare necessary reserve strength for the faster economic and social development in the 1990's. By 1990, the proportion of the agricultural output value in the total industrial and agricultural output value should drop from 27.7 percent in 1985 to 24.5 percent, that of the light industrial output value should rise from 35.1 percent to 37.8 percent, and that of the heavy industrial output value should rise from 37.2 percent to 37.7 percent. In the GNP, the proportion of the tertiary industry should rise from 21.3 percent in 1985 to 24.7 percent and that of the primary and secondary industries should drop from 78.7 percent to 75.3 percent. Fixed assets worth of 26 billion yuan should be added for the state units in the Seventh 5-Year Plan period, an increase of 6.57 billion yuan over that of the Sixth 5-Year Plan period. In this period, 67 large and medium-sized capital construction projects and above-quota projects for technological transformation and equipment renewal should be completed and commissioned. By 1990, 34 counties and cities throughout the province should make the 9-year compulsory education universal. In this period, the province should produce about 400,000 college graduates (including the graduates from adult schools). Of the newly added industrial and agricultural output value, over 25 percent should be gained by relying on scientific and technological progress. The quality and functions of over 40 percent of the total major industrial products should reach the national advanced level of that time.

4) On the basis of developing production and upgrading economic results, we should continue to improve the livelihood of the urban and rural people. By

1990, the consumption level of the urban and rural residents should reach 453 yuan, an increase of 32.1 percent over that of 1985. The per capita wage of the staff members and workers should reach 1,300 yuan, an increase of 257 yuan and an annual average increase of more than 4 percent. The per capita net income of the peasants should reach 530 yuan, an increase of 145 yuan over that of 1985 and an annual average increase of 6.6 percent. Further improvement should be made in the people's living standards and their living conditions. The natural population growth rate should keep within 11 per thousand.

The above-mentioned four tasks are closely related and linked with each other. Fundamentally speaking, reform is a task of the utmost importance. Only when we continue to deeply and systematically carry out the reform of the economic structure and bring different sectors of the economy into better balance can we be able to further emancipate the productive force and to ensure a smooth progress of the economic construction and the construction of all undertakings for social development. Simultaneously only when we lay a good foundation for the new economic structure that is suitable to our province's special characteristics and full of vitality can the economic vitality and prosperity be promoted in the 1990's and beyond.

The economic structural reform during the Seventh 5-Year Plan period is, in general, mainly composed of the following three parts.

First, enterprises, in particular large and medium-sized stage-owned ones, should be invigorated, and lateral economic cooperation should be greatly expanded. Effective measures should be adopted within and outside enterprises to expand their decision-making power in production and business. These measures include properly reducing mandatory plans, granting regulating tax reduction or exemption, raising the depreciation rate, lightening irrational burdens, applying and improving the systems of having plant directors (managers) assume full responsibility, and of having them assume the responsibility for fulfilling certain targets within their terms of office, reforming the wage and award systems, and the labor system of enterprises, and so forth. In this way, enterprises will acquire the capacity to accumulate funds for transformation and development. We should continue to straighten out and consolidate administrative, and semi-administrative companies. Except for a few departments and trades, no organs at the provincial level will have the power to administer enterprises directly. Cities should also separate government functions from those of enterprises, and delegate to enterprises the power they are entitled to so that enterprises will truly become relatively independent socialist commodity producers and distributors with autonomy in operation, and responsible for their own profits and losses. Focusing on upgrading product quality, and reducing material consumption, all enterprises should introduce overall quality control, establish and improve the quality guarantee system, and strengthen the various technological foundation of enterprises. We should establish an economic accounting system with the accounting of the plant or department as the center, that of the workshop as the emphasis, and that of the work group as the foundation, do a good job in the technological foundation of enterprises, and strive to apply modern management in enterprises. We should continue to develop various forms of ownership and operation on the premise that public ownership occupies a dominant position, and allow some small state-owned enterprises to be operated by collectives or individuals through contracts or leasing. Enterprises suffering poor management for a long period of time should be reorganized, and closed down, suspended, incorporated with others, or have their production lines converted in line with the principle of selecting the superior and eliminating the inferior. In particular, we should greatly promote the lateral economic cooperation among enterprises in the principle of voluntary participation, mutual benefit, and common development, and gradually establish associations of enterprises of various forms at various levels. At present, the great development of lateral economic cooperation is of extremely far-reaching significance in further facilitating the economic structural reform, and accelerating the national economic development. The purpose of the lateral economic cooperation among enterprises is to rationalize enterprise structure, the development of resources, the use of funds and technology, and the disposition of productive forces. We should give full play to the economic advantage of cities, and organize large industrial and mining enterprises to establish ties with township enterprises to allow the latter to carry out some of the production tasks of the former. We should also make the best use of our geographical condition of being close to Beijing and Tianjin, and absorb advanced technology to increase the competitive edges of our products. We should particularly advocate the cooperation between processing enterprises and raw material producing enterprises, between military and civilian enterprises, between production enterprises and scientific research and designing units (including colleges and universities), and among agricultural, industrial, commercial, and foreign trade enterprises. The cooperation may be closely, semi-closely, or loosely organized. It may be long-, medium- or short-term in the form of joint venture, cooperative production, or processing with provided materials. With regard to the defects in the managerial system cropping up in the course of cooperation, and some policies, and regulations hindering the cooperation, we should conscientiously study them, and actively readjust and improve them in the spirit of reform. Planning, finance, tax, supply, banking, and other provincial departments should study and formulate new policies and regulations, actively support and encourage enterprises to expand lateral economic cooperation, protect the legal rights and interests of all the parties joining the cooperation, and ensure the sound development of the various types of cooperation among enterprises.

Second, we should further develop the socialist commodity market, and gradually perfect the market system. We should continue to reduce the variety and quantity of the products allocated and distributed under the unified state plan, should further perfect the system of purchasing goods by contracts, and should expand the proportion of the farm and sideline products which are sold on markets at the negotiated prices. In purchasing and marketing the manufactured consumer goods, we should adopt such forms as allowing industrial enterprises to sell their products by themselves, allowing commercial units to order and buy such goods at their own choice and to market them on a commission basis, and allowing industrial and commercial units to market such goods jointly. Big and medium-sized cities should generally establish the production means markets, advocate the direct contacts between the producers and buyers, and unclog the circulation of goods. At the same time, we should gradually open up banking markets, expand the technological markets, and attend to commercializing residences on a trial basis. The key to establishing and perfecting the socialist market system lies in further reforming the pricing system and the price management system. At present in doing the price work, we should focus on consolidating and digesting the reform measures which have already been initiated, and resolutely maintaining the basic stability of the total price level. During the Seventh 5-Year Plan period, the focus of the price reform is to change the prices of energy, raw materials and other production means which were set low in a planned and step-by-step manner in order to gradually narrow the gap between the planned prices and the market prices. We should gradually loosen control over the prices of ordinary commodities. The state-run commerce should play its predominant role, and actively take part in the market regulation. Through reform, we should gradually establish the system under which the prices of a handful of important commodities and labor services are fixed by the state, and the prices of the remaining large number of commodities and labor services are subject to the state guiding prices and the market regulatory prices so that we can give good play to the regulatory role of prices as a lever.

Third, we should gradually relax the present forms of direct state control over enterprises and establish a new system under which this control will be exercised indirectly. We should also establish a new socialist macroeconomic management system. During the Seventh 5-Year Plan period, we should control and regulate the operation of economy through economic, legal, and necessary administrative means. The state plans are the major basis for giving macroeconomic guidance to and exercising control over the correct development of the national economy. To ensure the fulfillment of the planned targets and to develop the planned commodity economy, we should further reform the planning system, appropriately reduce the proportion of the mandatory plans, and expand the scale of the guidance plans and the market regulation. At the same time, we should gradually shift the focus of the planning work onto the orbit of comprehensively managing and regulating the macroeconomy through economic policies, through such economic levers as prices, tax collection, credit, interest rate, and wages, and through the comprehensive utilization of the economic regulatory means. Governments at all levels should systematically study and work out methods for comprehensively utilizing the economic levers in order to make various economic regulatory means coordinate with one another and to achieve the best macroeconomic efficiency. We should readjust and restructure the organizational departments, amplify and strengthen the comprehensive economic management departments, and raise the level of policy- and decision-making abilities and the ability to control the macroeconomy. Being the place to integrate the urban economy with the rural one, various counties should actively carry out experiments for the county-level comprehensive reform, and gradually popularize the experiences of various experimental counties. The professional economic departments should shift their work from exercising direct control over enterprises to formulating plans and technical policies for enterprises, providing information for enterprises, training competent persons for enterprises, and giving management services to them. We should attend to the building of the economic information network, strengthen the policy-making and advisory systems, and establish and improve various economic rules and regulations and the economic judicial work in order to raise the level of abilities to make macroeconomic decisions and policies and provide regulations and laws for various economic activities. We should amplify and intensify the forces of the auditing, statistical, pricing, and industrial and commercial administrative departments, should constantly perfect and step up the economic supervision, and should put the economic activities under the supervision of laws, so that we can ensure the normal progress of the economic life and promote the development of the social productivity.

3. The Several Tasks that Should be Emphasized in Order to Fulfill the Seventh 5-Year Plan

In order to fulfill the major tasks and fighting goals set forth in the Seventh 5-Year Plan, we should give full play to our advantage in resources and our favorable conditions while continuing the reform successfully, and emphasize the following eight fields of work concerning economic and social development.

1) We should continue to grasp grain production, and actively develop diverse undertakings. Agriculture is the foundation of the national economy, and grain is the foundation of the foundation. The grain production situation of the Seventh 5-Year Plan period has a direct bearing on the national economy as a whole. Because our province has a population of more than 50 million, feeding the people is a matter of prime importance, and, besides, the development in animal husbandry, aquaculture, food processing industry, and catering and service trades requires increasingly more grain. Our province achieved self-sufficiency in grain production in the past 2 years, but the self-sufficiency level was low. In our history, our province always lacked grain. Of the 33 years from 1953 to 1985, we shipped in grain from outside the province for 29 years, and shipped out grain for the other 4 years. Therefore, we must continue the principle of "never slackening grain production while actively developing diverse undertakings," make grain production successful, and strive to increase its per-unit yields in areas suitable for grain production. While ensuring increased grain production, we should readjust the structure of farming in line with local conditions, and vigorously develop cash crops, such as cotton and oil-bearing crops, and forestry, animal husbandry, and fisheries. In 1990, the province plans to make the grain output reach 22.5 million tons, cotton output 675,000 tons, and oil-bearing crops 1 to 1.1 million tons. We should conscientiously implement the relevant policies of the CPC Central Committee and the State Council, perfect the grain and cotton contracted purchasing system, stabilize the prices of the means of agricultural production, carry out multilayered measures aiming at "supporting rural industries with agricultural production," and basically balance the price ratios among farm products with the guidance of state plan in order to boost peasants' enthusiasm for grain production. We should gradually increase the investment in farmland irrigation projects, and the input for other agricultural purposes, ease the acute energy shortage in the rural areas, strengthen the overall management of the existing irrigation resources, and enhance the capability to combat disasters. We should strengthen land management, bring the land for nonagricultural use into strict control, resolutely stop arbitrary occupation of farmland, stabilize grain field acreage, and carry out intensive farming. In the eastern part of the province, the areas along the Beijing-Guangzhou railway, and the

Heilonggang area, we should gradually establish corn, wheat, cotton and other commodity production bases, and establish vegetable production bases on the outskirts of large and medium-sized cities. We should greatly expand forestry, animal husbandry, and fishery production. In forestry, we should expedite the construction of fast-growing and high-yielding forests, and farmland shelterbelts in easily accessible mountainous areas and plains, and further improve the forestry contract responsibility system. Reckless felling of trees should be resolutely banned. We should also greatly develop fruit trees, and intensify the technical management of the existing fruit trees. At the same time, we should emphasize the second-stage construction of the shelterbelts in north, northeast, and northwest China, around Beijing and Tianjin, in areas formerly flooded by the Yongding He, and in Pingshan County, and start the water and soil conservation project in the upper reaches of the Luan He and the Chaobai He. By 1990, we should strive to make 20 percent of the land of our province covered by forests, our forest tree reserves reach 70 million cubic meters, and our fruit production reach 2.5 million tons. In the development of animal husbandry and aquaculture, we should pool the efforts of the state, the collective and the individual, continue to do a good job in specialized production, and contracted operation, grasp animal feed production well, and establish a multipurpose service network. By 1990, we should strive to make our meat output reach 1 million tons, and the output of aquatic products 190,000 tons.

2) We should vigorously develop town- and township-run enterprises to accelerate the pace of economic development. The governments at all levels and relevant departments should consciously strengthen leadership over the development of town and township enterprises since it is a key link to vitalizing our province's economy. In accordance with the local natural resources and market demands and in line with the principle of "giving initiative assistance, making rational arrangement, giving correct guidance, and strengthening management," all localities should proceed from realities to give instructions, make good distribution of the town and township enterprises, and make good efforts to readjust product mix. Farming areas on plains should concentrate on developing industry for processing farm and sideline products. The areas around Beijing, Tianjin, and the large and medium-sized cities of our province should concentrate on developing machinery and various kinds of service trades to serve large industrial enterprises. Mountainous areas should focus on developing building materials and mining industries. Highlands should focus on developing meat and leather processing industries. We should strengthen lateral cooperation, technological transformation, and cultivation of technological personnel in order to upgrade the quality of enterprises. The total income of the town and township enterprises is planned to reach 35 billion to 40 billion yuan by 1990, doubling the figure of 1985. Greater progress should be made in the tertiary industry.

3) We should enthusiastically facilitate a comprehensive development of mountainous and coastal areas and highlands while further developing the economy on plains. Sixty-six counties occupying two-thirds of the province's total areas belong to mountainous and coastal areas and highlands, and more than one-third of the province's total population are living in these places. With so many living things and rich mineral resources, these areas have done a good job in developing and using their resources. In particular, the

mountainous areas and highlands are still economically and culturally backward, and their people's living standards are rather low. Thus, during the Seventh 5-Year Plan period, we should firmly grasp the comprehensive development of "mountainous and coastal areas and highlands" in an effort to gradually change their backward situation. In developing these areas, we must persistently carry out the principle of giving instructions in accordance with different actual conditions; bring into full play the advantages of localities to develop commodity economy; pay equal attention to developing farming, breeding, processing, mining and building industries, transportation, commerce, and service trade; and pool the efforts of the state, the collectives, and the individuals. The mountainous areas should carry out comprehensive development of forestry, fruit, livestock, mining and grain production with a focus on developing transportation; enthusiastically popularize the technologies suitable to their local conditions; vigorously develop forestry, fruit production and animal husbandry; and develop mining and building industries in accordance with local conditions. In accordance with the principle of establishing a chain-like coordination between scientific research, production, processing and marketing, we should grasp the precision processing of farm and sideline products. With regard to water and soil conservation, we should comprehensively develop mountainous areas, sloping fields, rivers, and beaches. The coastal areas should rationally develop and use the resources of rivers and beaches, and take the path of breeding high-yield quality aquatic products with a focus on breeding aquatic products such as fish and shrimps. We should grasp the comprehensive development of agriculture, animal husbandry, sideline occupation, and fishery, and the coordinated construction of production, storage, transportation, and marketing. We should make efforts to enthusiastically develop salt industry and tourism, and to build the coastal areas into salt industrial and aquatic products bases. Taking into consideration the forestry, grass, livestock and agricultural development with a focus on animal husbandry, we should enthusiastically develop man-made pastures and enclosed pastures, build shelter belts around grasslands, and strive to upgrade the livestock farms, ability to raise animals so as to gradually build the highlands into the bases for producing livestock products. The areas that are seriously degenerated into sandy or salinized lands should be given conditions for rehabilitation in an effort to restore their ecological balance. Through further implementing the policies and relaxing the policy restraints, we should give the people in the mountainous and coastal areas and highlands more self-management power in production and operation; and help these areas vitalize their inner potential. We should adopt various forms and open up various channels for collecting funds for development. While mobilizing the masses to collect funds, the financial departments at all levels and banks should give necessary assistance. The province, prefectures, cities and counties should set up special foundations for the development of these areas. All special funds should be allocated to counties in a step-by-step manner. The counties should make a unified plan to rationally use these funds and arrange the funds in the order of importance and urgency. We should strengthen the construction of infrastructures such as water and electricity supply projects and roads, do a good job in intellectual development, and organize and send scientific and technological personnel to mountainous and coastal areas and highlands. We should conscientiously implement the specific policies of the provincial government on developing the mountainous and coastal areas and highlands in order to accelerate the pace of the development of these areas.

The Heilonggang area should proceed from local reality in readjusting its production setup continuously, further improve grain and oil-bearing crop production, emphasize the construction of cotton production bases, and greatly expand forestry, fruit production, animal husbandry, and processing of farm and sideline products. It should strengthen farmland improvement projects, tackle drought, waterlogging, and alkaline land in a comprehensive manner, strive to change the outlook characterized by frequent disasters and low yields, and accelerate economic development.

Support-the-poor and disaster relief work should be carried out conscientiously. The provincial, and the various prefectural, city and county governments should formulate plans and institute the responsibility system to help poor households get rid of poverty and achieve affluence. They should particularly support the poor in poverty-stricken areas of minority nationalities, and render active support to their economic, and cultural development.

4) We should give priority to the development of light and textile industries, and strive to increase consumer goods production. Light and textile industries constitute a great advantage in our economic development. A great development in light and textile industries is an important measure to ease the contradiction between market supply and demand, and to bring about an economic leap in our province. During the Seventh 5-Year Plan period, we should focus on textile, food, animal feed, ceramic and medical industries, and strive to increase the production of cotton textiles, woolen textiles, printing and dyeing materials, household electric appliances, animal feed, garments, daily ceramics, paper, leather and other daily consumer goods, medical goods, and minor commodities. In the coming 5 years, while reducing the local investment in capital construction, we plan to make an investment of 2.91 billion yuan in the capital construction and technical transformation of light and textile industries. This figure shows a nearly 100-percent increase over that of the Sixth 5-Year Plan period. In the textile industry, we should emphasize the technical transformation of the export-oriented enterprises of the two major textile bases in Shijiazhuang and Handan Cities in order for them to produce more varied, serialized, and high-grade products. While continuing to develop the production of pure cotton products, and actively expand the production of chemical fibers, we should make efforts to increase the output of woolen and silk fabrics. The province plans to raise its cotton yarn output to 260,000 tons, its cotton cloth output to 1.15 billion meters, and its chemical fiber output to 30,000 tons by 1990. In the food industry, we plan to renovate and expand 10 soft drink plants, 6 beer breweries, and 4 backbone canned food enterprises, and double the output value in 5 years. Animal feed, ceramic, and medical industries should also be accelerated. All light industrial enterprises should pay attention to the development of new products, carry out processing more intensively, and expedite the upgrading and updating of products. Meanwhile, production enterprises should sign contracts with raw material production units for direct supply of materials, or for cooperative operation in order to establish stable raw material bases. By 1990, the output value of light industry in the entire industry should be raised to more than 50 percent.

5) We should bring the investment in fixed assets under control, and readjust investment pattern to strengthen key projects in energy, transportation, raw material, and telecommunications fields. According to the arrangements of the central authorities of dividing the Seventh 5-Year Plan into two steps, the scale of the investment in fixed assets should be brought under control, and a basic balance between the general social supply and demand should be realized in the first 2 years. The investment in the entire Seventh 5-Year Plan period should also be kept down to a scale commensurate with the capacity of the province. Over-extended investment scale will lead to an imbalance among the major sectors of the economy, and will delay the progress of modernization. In order to fix an appropriated investment scale, and increase the strength for future economic construction, we should further reform and improve the capital construction management system, and establish and perfect the social fixed asset management system during the Seventh 5-Year Plan period. With regard to new capital construction projects, we should make good early-stage preparations, and report to higher authorities and obstain approvals in strict accordance with procedures. Construction of key projects should be meticulously organized and carried out in line with the proper schedule, and its quality should be guaranteed, and cost lowered so that the investment can yield better returns. Except for the construction of middle and primary schools, kindergartens, and teachers training schools whose investment is provided by stand-by financial resources of the local enterprises and by the extra-budgetary funds, all the investments in the state-owned fixed assets should be incorporated into the scale of capital construction investment. The capital construction loans issued by banks must be incorporated into the capital construction plan. We should strengthen the management over and the guidance of the investments by the collectives and individuals in the urban and rural areas. At the same time, we should readjust the structure of the fixed assets, clear up the ongoing construction projects, and ensure the construction of key projects. We should truly spend the funds for technological transformation and renovation on the technological transformation projects of enterprises in order to promote the technological progress.

During the Seventh 5-Year Plan, the arrangements for the energy, transportation, raw materials, and communications projects are as follows: 1) We should continue to implement the principle of paying equal attention to development and economizing, give prominence to the construction of the power industry, and strive to increase the coal production. At the same time, we should strengthen the geological prospecting work, increase the reserve natural resources, and improve the ability to continue the construction. During the Seventh 5-Year Plan period, we plan to newly build the Shalingzi, Shangang, and Qinhuangdao Power Plants, and expand the Douhe, Tangshan, Shijiazhuang, Xingtai, Handan, and three other power plants as well as the energy-reserve power station of the Panjiakou reservoir. We plan to grasp the construction, continuation, and expansion of the 11 pairs of coal pits run by the collieries whose products are distributed under the unified state plan, attend to the construction of the 33 locally run coal pits, and complete the renovation of 700 small collieries run by towns and townships. We also plan to grasp the utilization and popularization of new energy resources in line with the principle of "suiting measures to local conditions, making up for the deficiency with sufficiency, comprehensively utilizing energy resources, and stressing on practical results." 2) While ensuring the construction of Daqin railway, a key state project, the localities should give prominence to developing highway transportation, and should accordingly develop local railways and water and air transportation. Construction of highways should spread toward outside places with the focus on improving and linking up the existing roads, and improving the technological situation and passing ability of key highways. We should strive to let highways and railways share the transportation task, and should attend to the construction of key tourist highways. Efforts should be made to open highways and railways in mountainous, coastal, and upland areas. We should strengthen the management of the local railways, renovate the existing railways, tap the potential of transportation lines, and give prominence to the building of the local railways in Weixian County. We should complete the construction of the Cangzhou Dakouhe local small harbor, and should make good preparations for the first stage of the Wangtan Harbor, the Tanggushuixian Harbor, which are newly built, and the Dakouhe Harbor, which is under expansion. 3) We should vigorously develop the metallurgical industry, the building materials industry, and the production of the basic chemical industrial raw materials, should pay attention to readjusting product mix, and should enhance the depth of the processing industry. We should emphatically grasp the expansion and renovation of the Tangshan, Xuanhua, Handan, and Chengde Iron and Steel Plants, should pay attention to the technical transformations of the Handan and Qixin Cement Plants, and the second broaching project [er la gong cheng 0059 2139 1562 4453] of the Qinhuangdao Glass Fiber Plant, should complete the project of the Qinhuangdao float glass production line, should successfully draw and digest the equipment imported by the Jidong Cement Plant, should actively develop new glass products and building ceramic products, and should expand the production capacity and the foreign exchange earning capacity. Meanwhile, we should grasp the construction of the Tangshan Soda Ash Plant, and the Qinhuangdao Phosphate and Ammonium Plant, and the renovation of the Cangzhou and Xuanhua Chemical Fertilizer Plants. 4) We should expand the local calling and long-distance calling capacity of the urban areas, strengthen the construction of the modernized communications means, and improve the communications situation of Shijiazhuang and the coastal open cities. In towns and townships, we should gradually form a multichannel and multilayered postal and telecommunications network under which the key and branch lines are linked with each other.

The machinery and electronics industries constitute the outfit department of the national economy. During the Seventh 5-Year Plan period, we should readjust and organize various kinds of integrations with the focus on the key enterprises and the key products. Through the import of advanced technologies, we should promote the development and application of the organic integration of the micro-electronics technologies and the machinery electronic technologies, should accelerate the pace of the self-renovation of technologies, and should accelerate the upgrading and updating of products. We should gradually attain the goal of producing products according to the international standards.

6) We should vigorously develop scientific, technological, and educational undertakings, speed up intellectual development, and promote technological progress. In order to greet the challenge of the new technological revolution,

we should further implement the policy that economic construction must depend on technological progress and that scientific and technological work must cater to the needs of economic construction, and should consider scientific and technological progress as one of our important strategic plans. During the Seventh 5-Year Plan period, the scientific and technological sector should attend to the three fields of work centering on the development of major trades, competitive products, "mountainous coastal, and plateau areas," and township enterprises and the establishment of commodity producing bases: First, we should vigorously implement the "spark plan" which mainly serves township enterprises and stresses the development and application of technological projects which require a short construction period and yield quick results. Second, on the basis of breeding major crops, fruit trees, livestock, poultry, and good strains, we should comprehensively develop major areas and carry out scientific and technological research in foodstuffs, animal feed, building materials, textile, medicines, microcomputer application, and biological engineering, organize scientific, and technical forces to tackle technical problems, and to solve key problems in the course of production and construction. Third, we should extensively promote and apply effective scientific and technological findings that yield quick results. During the Seventh 5-Year Plan period, we should carry out 31 key joint research projects and popularize 100 key scientific and technological findings and new technologies. Furthermore, we should strengthen seismological research and raise the level of prediction and forecast. In order to speed up scientific and technological development, we should conscientiously reform the scientific and technological system and the method of allocation of funds, expand the decision-making power of scientific research units, implement the system of the research institute directors assuming full responsibility, the system of signing technological contracts with foreign countries, and the contract responsibility system in carrying out technical projects, open up new sources of funds for scientific and technological projects through various channels, and gradually set up scientific and technological development funds as well as award funds so that scientific research units will have vitality in making progress through self-reliance and in serving economic construction. We should develop technological markets and speed up the commercialization of scientific and technological findings. We should also establish and improve socialized scientific and technological service organizations at all levels in counties, townships, villages, and communities, improve the technological development organs of enterprises, promote lateral cooperation among universities, colleges, research units, and production units, and form new scientific research and production associations. Technical personnel who have scored great scientific research achievements should be given handsome awards. Meanwhile, we should do a good job in popularizing scientific research findings, in digesting and absorbing import technology and in blazing new trails, rapidly change scientific and technological findings into productive forces, and raise the province's science and technology to a new level.

The social sciences sector should apply the basic Marxist theories, strive to explore objective laws from all fields in the course of building socialism, deeply explore and study major theoretical and practical problems focusing on Hebei Province's economic development strategy, system reform, production and construction, and produce a number of research findings of a fairly good quality.

Education is a foundation for promoting scientific and technological progress and for realizing the four modernizations. Paying great attention to education is our firm and long-term strategy. During the Seventh 5-Year Plan period, we should further balance the internal and external relations in the educational sector in line with the demands of "serving the modernization program, the world, and the future," define a rational scope and structure, and gradually form an educational system that meets the needs of the "four modernizations" construction program. In the Seventh 5-Year Plan, we should prominently stress the popularization of the 9-year compulsory educational system. Economic and cultural development has been uneven in various localities, therefore, we should adhere to the principle of seeking truth from facts and suiting measures to local conditions while conducting the 9-year compulsory education. We should not seek uniformity and deviate from reality in order to pursue high targets. We should carry out specific measures for giving instructions in accordance with different actual conditions. While consolidating and popularizing primary school education, the areas with better economic foundations should ensure an accomplishment of the work of making middle school education universal. The areas with ordinary economic conditions should concentrate the first 2 years of the Seventh 5-Year Plan period on popularizing primary school education, and then base on the achievements in popularizing primary school education to create conditions for making middle school education universal. Remote mountainous areas, highlands, and the areas with poor economic conditions should strive to basically make the primary school education universal in 3 years and beyond. All prefectures, cities, and countries and even townships should persistently proceed from actual conditions to work out fighting targets for making primary school education universal, and then carry them out in a step-by-step manner.

We should conscientiously grasp the work of wiping out illiteracy; and develop preschool education and the education especially for disabled people and retarded children. We should continue to carry out the reform of secondary educational structure; vigorously develop vocational and technical education, adopt various ways to run full-time vocational middle schools, agricultural middle schools, technical schools, and schools for staff members and workers; and strive to change the unitary situation of ordinary education. We must make great efforts to develop teachers training education since it is a basis for cultivating talented personnel. We must pay special attention to developing the county-level teachers training schools and advanced schools for teachers. We should focus the development of ordinary higher education on tapping the potential of existing institutions of higher learning, expanding the quotas for enrollment, and upgrading their educational quality. At the same time, we should further readjust the proportions between different categories of courses and between various specialized courses, and speed up the development of the branches of learning which we are short of, which we have not had, and which we are weak in. With regard to the development of adult education, we should strengthen the training courses for in-service workers through radio, television, correspondence, and press in order to upgrade the educational level of the vast number of cadres, workers, and peasants.

We should strive to improve public health and sports work. Through implementing the principle of "focu we should strengthen the prevention and cure of infectious and endemic diseases, and pay attention to preventing and curing the patients suffering from hypertension, apoplexy, and malignant tumors. The medical and public health departments at the provincial, prefectural, and city levels should give professional training and guidance to the rural medical units below the county level, organize key medical workers to make a circuit of different areas to give treatment. We should continue to set up and consolidate various kinds of medical cooperative associations. By making the most of the province's advantages, we should strive to develop traditional Chinese medical science and the production of traditional Chinese medicines. We should strengthen environmental protection work; strictly implement the "law on environmental protection" and the provincial regulations on environmental protection, and strive to improve the environmental sanitation of the urban and rural areas. We should unswervingly carry out the planned parenthood work; and continue to advocate the one-couple and one-child practice, to control a second birth, and to resolutely stop multibirths in an effort to continue keeping under control our province's natural population growth rate. We should strive to promote a scientific and socialized sports work, widely launch mass sports activities, upgrade the sports technical levels, bravely scale new heights in sports, and ceaselessly improve the people's physical and health conditions.

7) We should strengthen financial and banking management and the management of tax revenue in order to increase the revenue.

Finance is an issue relating to the whole situation as well as an important condition and guarantee for the economic development and the realization of the Seventh 5-Year Plan. During the Seventh 5-Year Plan period, we should continue to reform the financial and tax systems; study ways for making, collecting, and using money in the new situation; and make efforts to make financial departments become management and operation departments in a step-by-step manner. The financial departments should vigorously support the development of commodity production and focus on upgrading the economic results to flexibly use funds and open up financial resources. We should further strengthen tax revenue, firmly grasp the basic work for the management of tax revenue, stop all loopholes and upgrade the level of tax collection and management work. We should conscientiously strengthen financial construction and do a good job in increasing revenue and reducing expenditure. We should study and work out correct financial policies and reasonable regulations on financial affairs in order to bring into full play the role of the financial and tax revenue departments as an economic lever. We should reduce nonproductive expenses and administrative funds. Budgetary funds should be properly managed, and both budgetary and extra-budgetary funds should be planned and used in an all-round manner. Finance, tax, and auditing departments should fully perform their supervisory functions to ensure efficiency in fund utilization, and strict enforcement of financial and economic discipline. We should continue the work to help the counties relying on subsidies change such a situation. Such counties should develop production vigorously, expand circulation, and do a good job in increasing revenues and cutting expenditures. We should formulate special policies, and provide necessary money and materials to help them change the situation of relying on subsidies as soon as possible.

Banks at all levels should actively increase savings deposits, tap potential in funds, do a good job in the movement of capital, strengthen guidance to and regulation of the macroeconomy, and raise the benefit from fund utilization.

8) We should expand foreign trade, and strive to enhance our ability for earning foreign exchange through export. Faced with a new situation of further opening to the outside world, we should continue to expand foreign economic and technological exchanges, and strive to enhance our ability for earning foreign exchange through export during the Seventh 5-Year Plan period. We should vigorously organize the supply of commodities for export, and, in line with the principle of "allowing those who create foreign exchange to be benefited," adopt the method of allowing goods supplying units to share a certain amount of the foreign exchange they create so as to encourage them to export more and earn more foreign exchange. Based on the actual conditions of our province, we should give prominence to our priorities, make a success of the production and export of highly competitive and staple goods, strengthen the planning and construction of export commodity production bases and specialized plants, and gradually establish an export-oriented production system. We should further open up new international markets while continuously consolidating and expanding the original markets. This year, we should continue to make the international economic and technological cooperation and export trade meetings successful. We should greatly develop tourism, improve the two tourist areas of Chengde and Qinhuangdao, and the two tourist spots of the Qingdong tomb and the Xi tomb on a priority basis, gradually establish a tourist network with the characteristics and styles of our province, make our province more attractive to tourists, and increase our nontrade foreign exchange earnings. We should fully tap the potential for exporting labor service, and undertaking contracted projects abroad, and enhance our ability for earning more foreign exchange through the export of labor service. We should rationalize our import pattern to give priority to the software, advanced technologies, and key equipment commensurate with our economic development level. We should utilize more foreign funds, and use them emphatically in light and textile industries, energy, communications, and raw material industries, and the technical transformation and equipment renewal of the existing enterprises, and successfully combine foreign fund utilization with technology import, and technical transformation. We should also strengthen control over the projects to be imported, and the planned management of foreign fund utilization to avoid blind acts. As the only open coastal city of our province, Qinhuangdao City should enhance its role as a window to the opening to the outside world, intensify the construction of the economic development zone, score greater achievements in foreign economic and technological cooperation, and become a gateway of our province's foreign trade.

Fellow deputies!

The goals of the Seventh 5-Year Plan are grand, and its tasks are arduous but we can realize them through hard work. It unfolds in front of the people an encouraging brilliant prospect. The People's Governments at all levels should conscientiously organize its implementation, and resolutely carry it out.

In order to ensure the successful fulfillment of the Seventh 5-Year Plan, we must grasp the two civilizations simultaneously. Economic work is the center of socialist modernization, and ideological and political work is the guarantee. Following economic enlivening, and opening to the outside world, the people have acquired much new knowledge and many new ideas which correspond to modern civilization. However, inevitably, something negative has been brought in, which if not conscientiously tackled, will hinder the smooth progress of reform and construction. Therefore, we should vigorously strengthen the ideological and political work, and should conduct ideological education among the large number of cadres on patriotism, collectivism, communism, and on the cultivation of lofty ideals, moral integrity, cultural accomplishments, and discipline through the methods of vigorously propagating and commending the model deeds of the advanced units and figures. In this way, we can help the large number of cadres foster lofty communist ideas, consciously observe social ethics and professional morality, enhance their spirit, and actively plunge into the practice of realizing the Seventh 5-Year Plan and into the socialist modernization drive. All levels of cultural, broadcasting, television, press and periodicals, and publishing departments should adhere to the orientation of serving socialism and the people, should give top priority to social benefits, should frequently go deep into the reality of life, should maintain close ties with the masses, should be brave in making innovations and blazing new trails, should create still more and better spiritual products for the people, should enrich the people's cultural life, should foster the people's lofty moral values and healthy aesthetic standards, and should encourage the people to enthusiastically dedicate themselves to the four modernizations. In line with the economic development, we should appropriately increase the investment in the capital construction of the cultural and art undertakings. We should attend to the management of the cultural undertakings, and pay attention to the economic efficiency on the premise of paying attention to social benefits. We should also encourage and support the literary and art workers to create still more literary and art works. We should continue to penetratingly conduct the "five-stresses, four-beauty, and three-ardent love" activity, and should eliminate "dirtiness, disorder, and poor service" in the urban areas in order to make the urban environment green, clean, and beautiful. We should attend to urban planning and construction. In particular, we should effect a great change in the public health and environment of the various counties around the province's capital and of the nine cities under the jurisdiction of the provincial authorities. We should strengthen the propagation and education on the legal system, should deal strict blows to serious economic crimes and criminal offenses, should strengthen the comprehensive administration over public security, and should foster the good atmosphere of supporting the healthy trend and checking the evil trend. We should promote the fundamental improvement in social conduct, and create still better social environment for reform and construction.

To ensure the successful realization of the Seventh 5-Year Plan, government departments at all levels should vigorously grasp the implementation of this plan. They should be determined to rid themselves of the "excessive meetings and documents," should go deep into the reality of life to conduct investigations and studies, should formulate feasible and effective measures in line with the fresh experiences created by the masses and with the local conditions to creatively implement the principles of the central authorities and achieve success in the work. It should be advocated that cadres at all levels, leading cadres in particular, tell the truth, do solid work, give consideration to the overall situation, stress on the unity and practical results, and compete for making contributions. Cadres should foster the idea that "leadership means service," should consciously accept the supervision from the large number of the masses, should resolutely resist the corrosive influence of using powers to seek personal gain, should be honest in performing their official duties, should observe discipline and laws, should work assiduously, and should serve the people wholeheartedly.

Now we are in the period of great historical change. The province's Seventh 5-Year Plan is a majestic blueprint of the four modernizations. We must unite as one under the leadership of the CPC Central Committee, the State Council, and the provincial CPC Committee, and depend on the people of all nationalities across the province to work hard in line with the spirit of the Foolish Old Man who removed the mountains in order to successfully accomplish the province's Seventh 5-Year Plan!

PROVINCIAL AFFAIRS

HEI BOLI'S REPORT ON NINGXIA SEVENTH 5-YEAR PLAN

HK221200 Yinchuan NINGXIA RIBAO in Chinese 3 May 86 pp 1-2, 3

[Report on the Region's Seventh 5-Year Plan Delivered by Hei Boli, chairman of the Regional People's Government, at the Fourth Meeting of the Fifth People's Congress of Ningxia Hui Autonomous Region on 23 April 1986 -- "Carry Forward the Spirit of the Foolish Old Man Removing the Mountains and Strive for the Successful Fulfillment of the Seventh 5-Year Plan"]

[Excerpts] Fellow deputies:

On behalf of the autonomous regional people's government, I now submit a report on the Seventh 5-Year Plan for the Regional National Economic and Social Development for examination and approval by the present meeting.

We began to draft the region's Seventh 5-Year Plan in early 1984. Over the past 2 years, the regional people's government has organized all prefectures, cities, counties, and the departments concerned in the autonomous region to penetratingly discuss the guiding idea, basic tasks, and major targets of the region's economic and social development in the Seventh 5-Year Plan period and to strive to make forecasts in keeping with the objective reality. We have also reported to the State Council's departments and commissions concerned on numerous occasions. At the regional planning meeting held last February, in line with the guideline of the "Proposal of the CPC Central Committee for the Seventh 5-Year Plan for National Economic and Social Development," the major targets set for our region by the National Planning Conference, and the practical conditions in Ningxia, we further studied and revised the draft Seventh 5-Year Plan. Now, a draft Seventh 5-Year Plan for our region has been worked out, and is now submitted to the meeting for deliberation and approval. Here, I will first report on the implementation of Sixth 5-Year Plan. Then I will make some necessary explanations of the guiding idea and basic tasks of the national economic and social development during the Seventh 5-Year Plan period, as well as some relevant issues.

I. Review of the Implementation of the Sixth 5-Year Plan

Under the guidance of the correct line, principles, and policies of the CPC Central Committee and the State Council, with the vigorous support of the state departments concerned, under the leadership of the regional CPC committee, and with the arduous efforts of the people of all nationalities in the whole region, we have fulfilled the Sixth 5-Year Plan for our region ahead of schedule and consolidated and developed a political situation marked by stability and unity. In 1985, the region's total industrial and agricultural output value was 3,297 million yuan, an increase of 52.3 percent over 1980 or an average annual increase of 8.8 percent; the region's national income was 2,150 million yuan which, calculated in terms of comparable items, represented an increase of 57.9 percent over 1980 or an average annual increase of 9.6 percent. Unprecedentedly profound changes have taken place in our region's economic and social outlook. These changes are chiefly reflected in the following eight aspects:

1. The Rural Economy Has Rapidly Developed in an All-Round Way and has Started to Switch from the Self-Sufficient and Semi-Self-Sufficient Pattern to the Commodity One

In the Sixth 5-Year Plan period, our region successfully completed the first step of reform in the rural areas and successfully started the second step of reform. The thinking of the peasant masses was lively and their spiritual outlook took on an entirely new aspect. They broke through the narrow scope of traditional agriculture and embarked on the broad path of developing commodity production. The level of scientific farming and management has been extensively raised and bumper harvests have been reaped several years running. In 1985 total agricultural output value (including rural industries) was 1,112 million yuan, an increase of 55.3 percent over 1980 or an average annual increase of 9.2 percent. Grain output dropped in 1985 but we still managed to reap a good harvest. The grain output was 1,395,000 tons, an increase of 15.9 percent over 1980. The output of oil-bearing crops was 53,500 tons, an increase of 48.4 percent over 1980. As of 1983, we succeeded in changing the long-standing passive situation whereby we relied on the state-allocated grain to solve the food problem.

We have rationally adjusted the rural production setup. The proportion of agricultural output value in the entire rural production setup dropped from 76.5 percent in 1980 to 72.5 percent in 1985 and that of industry, building industry, transport and communications industries, commerce, and catering industry rose from 23.5 percent to 27.5 percent. The proportion of agriculture in the setup of agriculture, forestry, animal husbandry, sideline occupations, and fisheries dropped from 78.3 percent to 73 percent, while that of forestry, animal husbandry, sideline occupations, and fisheries rose. The proportion of industrial crops in the farming pattern notably rose. The 3-level gradual adjustments in the rural production setup have laid a foundation for the benign cycle of the rural economy in our region.

In the Sixth 5-Year Plan period, the commodity rate of farm produce rose continuously. In 1985, our region supplied 348,000 tons of commodity grain, an increase of 60.4 percent over 1980; 9,795 tons of edible oil, up 45 percent; 4,450 tons of eggs, up 76.8 percent; 1,536 tons of aquatic products, up 430 percent; and 17,735 tons of apples, up 270 percent. The total purchase value of agricultural and sideline products was 460 million yuan, an increase of about 130 percent over 1980.

A breakthrough has been made in the development of township enterprises. In 1985 there were 67,379 township-run, village-run, and individual enterprises, an increase of 1,000 percent over 1980; the number of employees increased to 185,000 people, which accounted for 16 percent of the rural labor force or represented an increase of 270 percent over 1980; the output value increased by 440 percent and the taxes delivered to the state increased at an average annual rate of 56.9 percent. In the 5-year period, the township enterprises spent 7.46 million yuan of their profits in subsidizing agriculture. The development of township enterprises has stimulated the adjustment of the rural production setup and the development of commodity production, instilled new vitality into the rural economy, and brought new hopes.

What is particularly gratifying is that by energetically growing grass, planting trees, and adjusting the production setup the perennially poor mountain areas in the south have, in recent years, started to reverse the loss of the ecological balance and basically stopped ecological destruction. In these areas, vegetation is being restored and soil erosion has initially been brought under control. With the aid of the World Food Program, the Xiji shelter-forest project has been completed ahead of schedule following the afforestation of 1.4 million mu of land. The economy of the entire mountain areas has come to life. Animal husbandry has picked up, grain production has been good for 3 consecutive years, and the serious shortage of fuel, fertilizer, and feed has eased to some extent. In the Sixth 5-Year Plan period, in addition to the Guhai and Tongxin pumping stations, we completed 36 drinking water projects, sank 400 deep wells, and dug 318 ponds and 123,000 water holes. With a total investment of 36.4 million yuan, we have solved the problem of drinking water for about 300,000 people, 90,000 large animals, and over 600,000 sheep and goats. Some 80 percent of the peasants in the mountain areas have basically solved the problem of food and clothing and some peasant households have become well off.

2. Industrial Production has Developed in a Steady and Coordinated Way and the Economic Results have Markedly Improved

During the period of the Sixth 5-Year Plan, we readjusted the internal industrial structure, speeded up the development of light industry, expanded the service scope of heavy industry, and vigorously developed new products; we consolidated the enterprises and strengthened and improved enterprise management; and we expanded the decision-making power of the enterprises and instituted and improved various forms of the economic responsibility system within the enterprises, thus arousing the initiative of the workers and staff members for production and rapidly restoring and developing industrial production. We fulfilled 1 year ahead of schedule the target for total industrial output value laid down in the Sixth 5-Year Plan. Total industrial output value (excluding rural industries) reached 2,185 million yuan in 1985, an increase of 50.8 percent over 1980 or an average annual increase of 8.6 percent, exceeding the growth rate of 3.1 percent specified in the plan. We fulfilled or overfulfilled 31 of the assessment products listed in the Sixth 5-Year Plan. The output of ferroalloy, electricity, tyres, raw coal, calcium carbide, paint, ephedrine, artificial boards, cement, plaster stone, industrial pumps, metal cutting lathes, transformers, walking tractors, internal-combustion engines, machine-made paper, paperboards, sugar, synthetic detergent, matches, and beer increased by considerable margins.

The pace of technological transformation in industry has been quickened. Over the past 5 years, we have invested 877 million in technological transformation projects and completed or commissioned 85 key transformation projects. The technological transformation has increased output value by more than 335 million yuan, accounting for 42 percent of the newly increased output value; increased profits or taxes by about 87.85 million yuan, accounting for more than 50 percent of the newly increased profit or tax amount. Many old mines have completed the technological transformation or coordinated projects with the extension and deepening of mines as the main target. Because they attached importance to technological transformation and stimulated technological progress, 20-plus enterprises, including the Xibei Coal Machine Plant. Changcheng Machine Tool Plant, Dahe Machine Tool Plant, Xibei Bearing Plant, Wuzhong Instrument and Meter Plant, Wuzhong Timber Machinery Plant, and Yinhe Instrument and Meter Plant, turned out many new products during the Sixth 5-Year Plan period, such as the numerical control machine tools, processing equipment, automatic regulating valves, a new type of metal testing machine, Helanshan brand extra-large cylindrical roller bearings and single-file conical roller bearings, scraper conveyors, and explosion-proof electric machines.

Industrial production is advancing along the track of stressing better economic results. In the Sixth 5-Year Plan period, the quality indexes of 9 of the 12 listed key assessment products were improved or raised, accounting for 75 percent of the total. By the end of 1985, a total of 128 quality products had been chosen throughout the region. Of these, seven were awarded gold or silver medals by the state and 28 were presented with high-quality certificates by the ministries concerned. In 1985 the region's rate of high-quality products rose to 13.29 percent. The number of enterprises operating at a loss dropped from 66 in 1980 to 15 in 1985. None of the coal, machinery, building material, and medical enterprises are now operating at a loss. The profit rates for every 100 yuan's worth of fixed assets and for every 100 yuan's worth of output value of industrial enterprises have improved and the turnover of circulating capital has increased. In 1985 the profits or taxes of the local budgetary state-owned industrial enterprises increased by 66.4 percent over 1980, an average annual increase of 10.7 percent.

New successes have also been scored in transport and communications and in post and telecommunications. In 1985 the turnovers of railway freight and passengers respectively increased by 20.7 and 63.7 percent over 1980 and the turnover of highway passengers by 125 percent. The collective and individual transport undertakings in the urban and rural areas also developed fairly rapidly. They have played a positive role in speeding up the circulation of goods and materials. In particular, the scheduled flights between Yinchuan, Xian, and Beijing opened last year have facilitated exchanges between our region and other parts of the country. In 1985 the region's total business volume of post and telecommunications reached 10.87 million yuan, an increase of 100 percent over 1980.

3. We Have Fulfilled the Plan for Capital Construction and Further Strengthened the Material and Technological Foundation for National Economic Development

In the Sixth 5-Year Plan period, investments in the fixed assets of state enterprises reached 3.09 billion yuan. Of this, investments in capital construction were 2.05 billion yuan, investments in technological transformation were 1.04 billion yuan; investments in newly increased fixed assets were 1.42 billion yuan. More than 3,000 projects, including 19 big and medium-sized ones, were completed and commissioned. In the 5-year period, the installed generated capacity increased by 100,000 kilowatts, coal mining by 529,000 tons, chemical fertilizer by 13,180 tons, and cement by 467,000 tons. We have built or repaired 400-plus km of highways, erected 325 km of power transmission lines of more than 110,000 volts, increased 6,000 wool spinning spindles, and expanded the irrigated area by 480,000 mu. A number of industrial projects, such as the Yinchuan No. 2 Woolen Mill, Yinchuan Woolen Strip Mill, Yinchuan Polyester Plant, Pingluo Sugar Refinery, Ruqigou Coal Mine, and the extension project of Gingtongxia Cement Plant, have been completed and commissioned. They have begun to yield results. The Guhai pumping station, which has basically been completed, is irrigating nearly 200,000 mu of land. The completion and commissioning of the Ningxia-Gansu power network project have put to an end a long-standing situation marked by the solitary operation of the region's power network. The No. 1 generator at the Dawukou Power Plant, with a capacity of 100,000 kilowatts, has gone into operation. The construction of the Ningxia Chemical Plant, a key project using foreign technology, officially started in May 1985. The construction of a number of key capital construction projects and technological transformation projects is in full swing. Our successes in capital construction and technological transformation during the period of the Sixth 5-Year Plan have not only stimulated the sustained and steady development of our region's economy at a relatively high speed but also provided the strength needed for economic development in the Seventh 5-Year Plan period and the 1990's.

4. The Financial Situation Has Further Improved; Bank Credit and Insurance Undertakings Have Registered New Developments

In the Sixth 5-Year Plan period, our region energetically conducted reform of the financial and taxation structures, opened up all financial resources, tried by every possible means to raise funds, adjusted the financial distribution structure, made rational arrangements for financial expenditures, tightened capital control, and thus further improved the financial situation. In 1985 the local revenues were 290 million yuan, an increase of 42.8 percent over 1980 or an average annual increase of 7.4 percent. Over the past 5 years, we have received 960 million yuan in local revenues, overfulfilling the quota laid down in the Sixth 5-Year Plan 1 year ahead of schedule.

By encouraging various kinds of deposits, opening up the financial resources, and raising, and promoting the flow of capital, the People's Banks at all levels and all the specialized banks managed to maintain a favorable balance of 1.85 billion yuan of various deposits at the end of 1985, an increase of 177 percent over 1980. The balance of various credits was 2.17 billion yuan, an increase of 160 percent over 1980. The growth and extensive use of credits have played an important role in promoting the development of industrial and agricultural production and the circulation of commodities.

The people's insurance undertakings have played a positive role in fighting natural disasters, providing disaster relief, supporting production, and protecting the lives and property of the people.

5. By Adhering to the Policy of Opening Up in Construction and Smashing the Closed Economic Pattern, We Have Attained Initial Results in Introducing Investment from Abroad and Establishing Lateral Ties at Home

In the Sixth 5-Year Plan period, we energetically launched economic and technological cooperation with fraternal provinces, municipalities and autonomous regions. We have signed 1,009 economic and technological cooperation contracts with 21 provinces, municipalities and autonomous regions, and a dozen or so universities, colleges, and scientific research institutes. Of the 107 letters of intent on joint investment and construction, which provide for the lateral flows of capital through such methods as cooperative ventures and compensation trade, we have allocated, or started to use, cooperative funds amounting to 102.28 million yuan in the construction, extension, or transformation of 15 enterprises. Of the 902 technological cooperation contracts, 630 have been implemented or fulfilled. Introducing advanced technologies, techniques, equipment, and managerial skills from other provinces and regions in light of the local conditions has played an important role in urging the enterprises in our region to make the most of their existing potential, to carry out technological transformation, to make technological advances, to improve product quality, and to increase their ability to compete. Through cooperation we have also set up a number of township enterprises, which stimulate the development of the rural commodity economy and the readjustment of production setup in our region. Meanwhile, we have also employed over 300 middle school teachers and over 500 engineering and technical personnel from other provinces and regions to teach or to pass on their skills and experiences in our region. The fraternal provinces and regions have also trained for our region a large number of college graduates, teachers, and medical workers. Moreover, through cooperation we have delivered from or to our region various kinds of materials worth more than 80 million yuan in the past 2 years. This has helped adjust our deficiency and surplus and supported our production and construction.

In line with the principle of "supporting the development of the mountain areas with that of the plain areas and encouraging them to support each other" laid down by the regional CPC committee, we have vigorously developed lateral economic combination and technological cooperation between cities and counties and have achieved notable results. In the meantime, lateral combinations among large and medium-sized key enterprises, scientific research units, and small enterprises have been more frequent, extensive, and diversified. According to incomplete statistics, 21 large and medium-sized key enterprises have embarked on the road of spreading their products and doubling their output. In an effort to develop themselves, many enterprises have adopted the method of close or loose combination among themselves or with scientific research units. By making the best possible use of one's favorable conditions and promoting simultaneous development, we can expect the embryonic forms of various new economic combinations to take shape in our region, which will stimulate the rationalization of our economic structure.

In the Sixth 5-Year Plan period, considerable achievements were attained in foreign trade. We have so far established trade relations with 50-plus countries and regions and conducted our own import and export business. Over the past 5 years, we have earned $75 million in foreign exchange through direct export. In 1985 the foreign trade departments and enterprises and the production enterprises worked in close coordination, tried by every possible means to readjust the commodity structure, changed the methods of operation, and energetically opened up new international sales markets. In spite of export commodity shortages, they managed to earn $31.53 million in foreign exchange through export, topping all previous records and increasing by nearly 600 percent over 1980. The number of export commodities has exceeded 100. The export of high-quality anthracite has increased considerably. In 1985 our region exported 195,000 tons of anthracite and earned $15.59 million in foreign exchange. The proportion of industrial and mining products in the export commodities was more than 70 percent, thus changing the previous situation whereby we chiefly exported farm, sideline, special, and native products.

We have initially opened up a situation in introducing foreign capital and technology and developing international economic and technological cooperation. In line with the special features of the nationalities in our region, a Ningxia Muslim goodwill mission has made a successful visit to six Middle East countries. We have sponsored various activities, such as holding an international economic and technological cooperation symposium. We have stepped up friendly exchanges between our region and the Arab countries and increased our mutual understanding, thus laying a foundation and opening up new channels for the development of economic and trade cooperation and of cultural and technological exchanges. During the Sixth 5-Year Plan period, we signed contracts for the imports of 59 technological projects worth $37.7 million. We also signed contracts on the use of foreign capital and on compensation trade totaling more than $12 million. By importing the world advanced technologies of the late 1970's and early 1980's we have not only developed a number of new products but also transformed a number of outdated enterprises, thus notably improving the technological level and the economic results.

In the Sixth 5-Year Plan period, new achievements were also attained in foreign affairs, tourism, and overseas Chinese affairs.

6. New Achievements have been Attained in Education, Science and Technology, and Culture

In the Sixth 5-Year Plan period, educational expenses increased at an average annual rate of 16 percent. The proportion of educational expenses in the region's total expenditures was higher than the average national level. The number of universities and colleges has increased from four to seven and the number of students has increased by 48.2 percent over 1980. Over the past 5 years, we have trained over 5,900 professionals of all kinds. There are now 436 middle schools and the number of middle school students has increased by 6.3 percent over 1980. New headway has been made in making primary education universal. There are now 4,359 primary schools throughout the region and the number of pupils has increased by 12.1 percent over 1980. Primary education has been made universal in Zhongwei and Helan counties. Nationality education has been gradually stressed and the proportion of pupils of minority nationalities in various levels and types of schools has increased considerably. The structure of secondary education has been initially adjusted. There are now 29 vocational and technical schools offering 48 specialties to more than 10,000 students. They have provided our society with a number of laborers with both education and skills. Notable achievements have also been attained in the education of workers and staff members and of peasants.

We have made gratifying headway in science and technology. Our science and technology work is geared to the needs of economic construction and is oriented toward popular application, technological introduction, and new fields of study. We have conducted investigation of natural resources and designation of agricultural zones, popularized the cultivation techniques of high- and steady-yield wheat and rice on large areas, energetically improved grass growing and tree planting in the mountain areas in the south, studied the exploitation and use of various resources, such as coal and gypsum, and concentrate our forces on tackling major technological problems in combination with production and construction. In the Sixth 5-Year Plan period, 300-plus scientific and technological inventions were given awards by the autonomous region and four were awarded national-level prizes for scientific and technological progress. Applications have been submitted for the patent rights of a number of inventions. More than 80 percent of the scientific and technological inventions have been applied and popularized. They have begun yielding economic results.

7. With Brisk Buying and Selling, the Market is Prosperous and the Living Standards of the Urban and Rural Population Have Universally Improved

In the Sixth 5-Year Plan period, a commodity circulation structure with open urban and rural markets, multiple channels, and fewer links began to take shape in our region. This has stimulated commercial development and market prosperity. In 1985, there were more than 34,000 state, collective, and individual shops, an increase of more than 500 percent over 1980; and total volume of retail sales was 1.53 billion yuan, up by 90.5 percent. There are 170-plus trading centers in the urban and rural areas. With a total turnover increasing by more than 300 percent over 1980, they have played a positive role.

On the basis of increased production, the living standards of the urban and rural population have notably improved. According to a sample survey, the annual per-capita outlays of urban residents on personal living expenses were 673 yuan in 1985, an increase of 53.5 percent over 1980 or, after allowing for price increases, an average annual increase of 5.1 percent; the annual per-capita net income of the peasants was 326 yuan, up by 86.1 percent over 1980 or, after allowing for price increases, an average annual increase of 10 percent.

The balance of savings deposits by urban and rural population was 800 million yuan, an increase of 369 percent over 1980, the consumption level of the people has notably risen and the number of households owning durable consumer goods has notably increased. The housing conditions of the urban and rural population have improved considerably.

8. Reform of the Economic Structure has Developed in a Sound Way and the Economic Field has been Brimming with Vitality

In the Sixth 5-Year Plan period, in line with the plans of thw CPC Central Committee and the State Council and by relying on the enthusiasm and creative spirit of the vast numbers of cadres and people, we energetically and cautiously pushed forward the reform of the economic structure. On the premise of adherence to the socialist system of collective ownership, we instituted, in the rural areas and in an all-round way, a series of reform measures based on the system of contracted responsibility on the household basis, with remuneration linked to output, and adjusted the relations of production in the rural areas. This has greatly aroused the initiative of the peasants for socialism and brought an unprecedented scene of prosperity to the rural economy.

Fellow Deputies,

While summing up the success of our region in economic and social development, we should soberly note the numerous difficulties and problems in our path. There are also certain shortcomings and errors in our work. The level of economic development in our region is still fairly low, our agricultural foundation is still quite weak, our ecological and production conditions are still relatively poor, particularly in the mountain areas in the south, and the living standards of a number of people is still quite low. There is still an apparent gap between the economic results of our enterprises and those of the nation as a whole in the fields of production, construction, and circulation. We have not been able to turn many of our advantages in natural resources into economic advantages. The training of capable persons cannot meet the needs of socialist modernization. The shortages of some raw materials, insufficient railroad capacity, and uncoordinated infrastructure are still factors restricting the region's economic development. Lacing foresight, the regional people's government has failed to conduct a thorough investigation and study and to solve some problems in good time. In exercising macroeconomic control, we still lack strong measures and effective supervision. The reduction of grain output in 1985 was due to natural disasters. It was also caused by the shortcomings in our work. For a time last year we did not pay sufficient attention to grain production. We should face up to these difficulties and problems, sum up our experience and, in light of the practical conditions in Ningxia, self-reliantly carry out hard struggle and act within our capabilities. We should pay attention to practical results, make further efforts to do a good job of various reform and construction tasks, and consolidate and develop the excellent situation created in the Sixth 5-Year Plan period so that our national economy will steadily advance along the path of all-round and sound development centering on the attainment of better economic results.

II. The Guiding Idea and Basic Tasks in the Seventh 5-Year Plan Period

The Seventh 5-Year Plan covers a crucial period. The guiding idea for our region's economic and social development is to further implement the important instruction of the central leading comrades that "Xingxia should bring about an upswing ahead of others," to continue to carry out the basic policy of "invigorating the domestic economy and opening up to the outside world" and, with the spirit of pressing ahead and at a realistic and prudent pace, to promote the development of our region's economy along the track of a benign circle, which is full of vigor and vitality and is highly efficient and effective. The basic task of our region in the Seventh 5-Year Plan period are: 1) Under the unified leadership and arrangement of the central authorities, we should make further efforts to create a fine economic and social environment and strive to maintain a basic balance between aggregate social demand and aggregate social supply so that the reform of the economic structure, with the focus on the urban economy, can be conducted more smoothly. 2) We should pay close attention to the work of tapping the potential of, and transforming, the existing enterprises and production facilities, make proper arrangements for a number of key projects, such as energy, transport, raw materials, and water conservancy, continue to step up the development of intellectual resources, open wider to the outside world and, on the basis of improving economic results, strive for a higher economic growth rate than the national average in order to provide the strength needed for the continued economic and social development in the 1990's. We should adopt effective measures to vigorously help the mountain areas in the south to change their poverty. 3) We should continue to improve the people's living standards on the basis of increased production. Our specific objectives are: Calculated in terms of constant prices of 1980, the region's total industrial and agricultural output value will reach 5 billion yuan in 1990, an increase of 51.5 percent over that of 1985, and the region's GNP will come to 4.1 billion yuan, an increase of 52.5 percent. This represents a 1.3-fold increase over 1980, achieving the goal of quadruplication ahead of schedule. Local revenues will reach 420 million yuan, an average annual increase of 7.9 percent for the period in question. The per-capita consumption level of the urban and rural residents will increase by an average of 5 percent annually.

To ensure the smooth achievement of the above-mentioned objectives, we should concentrate on considering and studying the following problems in economic construction:

1. While Working for Better Economic Results, we Should Fix an Appropriate Rate for Economic Growth so that the Economic Construction Can Develop in a Steady, Stable, and Balanced Way

Fixing an appropriate rate for economic growth for the Seventh 5-Year Plan period is very important to increasing the economic strength and improving the people's standard of living. The draft Seventh 5-Year Plan provides that the region's total industrial and agricultural output value should increase by an average of 8.7 percent. Of that total, the value of agricultural output will rise at an average annual rate of 6.8 percent, while the value of industrial output will rise at a rate of 9.6 percent. The GNP is to increase by an average of 8.8 percent annually. We have many favorable conditions to achieve such growth rates. We have shifted the strategy for economic development to the path of stressing the attainment of better economic results, of taking agriculture as the foundation and the energy and high energy consumption industries as the focus, and of speeding up the development of consumer goods industry. Our region is rich in natural resources, which constitutes favorable natural conditions for economic development. The per-capita areas of cultivated land, irrigated land, and grassland in our region are higher than the national average. This has provided favorable conditions for the development of mass agriculture. Our rich energy and nonmetallic mineral resources make it possible for us to concentrate on developing the energy industry, the high energy consumption industry, and the building materials industry and to promote the rapid development of industry as a whole. Regarding the economic operation mechanism, with the in-depth development of the economic restructuring and the continued implementation of opening the region to domestic businesses and overseas investors, the socialist market will be continuously expanded and various forms of lateral ties will be increasingly strengthened. This will open up a broader path for the development of the productive forces. Taking into consideration the fact that a number of large and medium-sized projects will be completed and commissioned during the Seventh 5-Year Plan period, as well as other factors, such as the technological transformation of existing enterprises and the rapid development of township enterprises, the rate of economic growth as provided in the Seventh 5-Year Plan can be reached provided that we strive to do our work well.

In an effort to successfully achieve the above-mentioned objectives, the draft Seventh 5-Year Plan has made the following arrangements for industrial and agricultural production:

In agriculture, total rural product of society in 1990 will reach 2.6 billion yuan and total agricultural output value will reach 1.4 billion yuan. Grain output will reach 1.75-1.85 million tons and the gross output value of township enterprises will reach 1 billion yuan. We must conscientiously implement the strategic principle of taking agriculture as the foundation of the national economy and rely on policies, science, and technology investment in agriculture. On the premise that grain production should never be relaxed, we should vigorously develop diversified undertakings, adjust the production setup, develop commodity production, promote the development of commodity production centers, particularly the development of comprehensive commodity production centers by enterprises built on reclaimed wastelands, and increase the accumulation capability of agriculture. We should unswervingly promote the construction of agricultural infrastructure and speed up the development of two new irrigated areas covering 1 million mu each. We should speed up the completion of Guhai pumping station and the construction of Yanhuanding pumping station. Great efforts should be made and numerous measures should be taken to solve the problem of drinking water for both men and animals in the mountain areas in the south. We should vigorously grow grass and plant trees, integrate the development of agriculture with that of forestry and animal husbandry, and energetically develop animal husbandry. Continued support should be given to township enterprises and the focus of development should be placed on processing industry with farm and sideline products as raw materials, as well as on mining, building materials, and other service industries.

In industrial production, while working for better economic results and product quality, we should strive to increase the total industrial output value to 3.6 billion yuan in the last year of the Seventh 5-Year Plan period and to achieve a sizable increase in output value, profits or taxes, and revenues. Further efforts should be made to invigorate large and medium-sized enterprises and to instil vitality into enterprises in general. There are now 36 large and medium-sized enterprises in our region. With their output value and profits or taxes accounting for more than 50 percent of the region, they are the leading force of our region's economy and the mainstay of local revenues. Invigorating these enterprises and increasing their ability to accumulate capital, to initiate reforms, and to grow on their own is of vital importance to the development of the region's economy as a whole. For this reason, it is necessary to resolutely implement the stipulations of the State Council on expanding the decision-making power of enterprises and invigorating large- and medium-sized state industrial enterprises and to make further efforts to streamline administration and institute decentralization so that the enterprises can become genuinely independent socialist commodity producers and dealers. It is necessary to create a favorable external environment for the invigoration of enterprises, to adjust or reduce the regulation taxes of some large- and medium-sized enterprises in a planned and systematic way, to increase the rate of depreciation, and to use this fund principally on the technological transformation of enterprises. We should resolutely curb the practice of indiscriminately setting quotas and apportioning expenses to enterprises and strive to reduce their social burdens.

Vigorous efforts should be made to promote technological advances among the enterprises. We should strive to complete technological transformation in more than half of the large- and medium-sized enterprises within 5 years. Conscientious efforts should be made to develop technology based on new products and new techniques and to popularize the application of new technology in order to raise to a new level the technological capability of the enterprises throughout the region. In the Seventh 5-Year Plan period, we should develop more than 1,000 new products and create 170 brand-name, high-quality products. The major products of all large- and medium-sized enterprises should be upgraded. Particular attention should be paid to developing the production of textile, paper, food, drink, and other manufactured goods. We should organize forces to digest and assimilate the technology imported during the Sixth 5-Year Plan period in order to bring their benefit into full play.

Vigorous efforts should be made to strengthen enterprise management. Technology is backward in our region and management is even more so. In the Seventh 5-Year Plan period, we should concentrate our efforts on strengthening enterprise management and work conscientiously to achieve successes. The focus of enterprise management should be placed on improving product quality, reducing consumption, and attaining better economic results in an all-round way. We should extensively institute the system of all-round quality management and strengthen quality control and standard measurement. Great efforts should be made to save on energy and to reduce consumption so that the technological indexes and the material consumption indexes of the major products of most state industrial enterprises can be considerably improved or raised in the Seventh 5-Year Plan period. We should continue to conduct reform of the leadership structure, energetically institute the director (manager) responsibility system, and promote other necessary reforms in the enterprises. We should improve foundation work and energetically practice modern management. We should also do a good job of trade planning and management.

The departments in charge of comprehensive economic management and the responsible departments should do a good job of coordinating and balancing energy and transport. They should satisfactorily solve such questions as the shortage of raw materials and circulating capital, do a good job of market forecasts, maintain a balance between supply and demand, speed up the adjustment of product mix, and genuinely organize production according to social needs. In the Seventh 5-Year Plan period, there will still be an acute strain on transport in our region. The railroad and highway transport departments should try by every possible means to tap potential and to increase transport capability. They should make particular efforts to adjust the transport structure, to satisfactorily organize highway transport, and to ensure the needs of industrial and agricultural production and circulation, and the needs of the people in their daily life.

In line with the requirements of the draft Seventh 5-Year Plan, local revenues will increase at an annual rate of 7.9 percent. Efforts should be made to achieve a basic balance in local finance and credits. We should highly value the capital provided by the state and, while exercising effective control over the use of capital, strive to develop the economy and to open up all financial resources. Financial and tax departments at all levels should concentrate their efforts on improved methods of acquiring, accumulating, managing, and spending money, energetically support the development of new production fields, and help enterprises to make good arrangements for their funds, to improve economic results, to turn deficits into profits, and to eliminate operational losses. It is necessary to strengthen the work of collecting and managing taxes. Further efforts should be made to enforce financial discipline, to strictly control expenditures, to encourage thrift and hard work, to oppose extravagance and waste, to cut down administrative expenses, and to reduce the purchasing power of social groups. Because the proportion of extrabudgetary capital is very large, it is necessary to bring it into the orbit of macroeconomic development through rational organization and guidance. Particular efforts should be made to strengthen the important functions of the banks in macroeconomic management and, through the reform of the banking system, to gradually establish a powerful and flexible monetary control and regulatory system, to bring into full play the role of the banking system in raising and accommodating funds, guiding the flow of capital, and regulating social demand, and to raise the utilization rate of capital.

2. Conscientiously Strengthen Control over the Scale of Investment in Fixed Assets, Rationally Adjust the Investment Patterns, and Strive to Improve the Investment Results

In the Seventh 5-Year Plan period, the state sets the scope of investment in fixed assets for state units in our region at 3,893 million yuan. Of this total, investment in capital construction is set at 2,807 million yuan, investment in upgrading and transforming enterprises at 816 million yuan, and investments in other fields at 270 million yuan. In the first 2 years of the Seventh 5-Year Plan period, investment in fixed capital will generally be maintained at the 1985 level and, in the last 3 years, will be appropriately increased. Controlling investment in fixed assets, particularly in capital construction, at a rational level and achieving a basic balance between aggregate social demand and supply constitute a fundamental condition for ensuring correct proportions among different branches of the economy and a stable economic life. To this end, it is necessary to strengthen centralized and unified management over investment in capital construction by state units. As of 1986, with the exception of middle and primary schools, kindergartens, normal schools, and teachers colleges built with the funds of local authorities and enterprises, all other projects must be brought into line with the scope of investment in capital construction and controlled by different means. Local budgetary investment using bank credits instead of state allocations will be placed under the unified arrangement of the regional economic commission. It is necessary to bring the scope of self-raised funds under strict control and to strengthen guidance and control over investments by collective units and individuals in the urban and rural areas.

We should rationally adjust the investment patterns so that the basic industries, infrastructure, and processing industry, as well as construction projects either related or unrelated to production, can develop in a coordinated manner and improve the investment returns. This is an important task of managing investment in fixed assets in the Seventh 5-Year Plan period. The main purpose of this task is: 1) We should bring into full play our region's favorable conditions in natural resources, vigorously devleop the energy industry centering on coal and electricity, and energetically develop metallurgical, building materials, chemical, and other raw materials industries, and textile and other light industries. We should do a good job of key construction projects, such as the Dawukou Power Station, Gingtongxia Aluminum Plant (expansion), Ningxia Chemical Plant, Daba Power Plant, the Shizuishan No. 3 well, Baijigou Mine (extension project) at Shitanjing, Ningxia Ferroalloy Works, Ningxia Oil Refinery, Gingtongxia Sugar Refinery, and the second-phase project of Yinchuan Polyester Plant. After these projects are completed and commissioned, they will increase output value by 1,160 million yuan and profits or taxes by 48 million yuan. They will also increase generated electricity by 600,000 kilowatts, the output of coal by 1.4 million tons, aluminum ingots by 100,000 tons, ferroalloy by 50,000 tons, synthetic amonia by 300,000 tons, cement by 230,000 tons, sugar by 25,000 tons, and fine wool fabric by 1.5 million meters, and the capacity to refine crude oil by 750,000 tons and to irrigate 240,000 mu of land. We have developed various production centers, such as anthracite, electricity, aluminum, ferroalloy, and carbon products. Preparations should be made for such key construction projects as Lingwu coalfield, the feeder railway line to Lingwu, and Baige Airport in Yinchuan. The new Yinchuan railway station is to be completed before the 30th anniversary of the founding of the autonomous region. It is necessary to set up the construction of highway transport networks. While transforming the existing trunk highways, we should complete the mountain highway along the Helan Shan, the Huang He bridge in Shizuishan, and the Heifenggou bridge in Tongxin. We should adopt numerous methods, such as "run by the local people and subsidized by the state," to speed up the construction of roads in counties and townships. Efforts should be made to step up the construction of telecommunications facilities, to improve telecommunications lines in the rural areas, and to use social force to increase the transport capacity of the post and telecommunications departments. 2) Proper limits should be set on the growth of investment in nonproduction construction projects so that the same amount of investment can generate greater production capacity. Our financial resources are limited and we have to rely on generous allowance from the state every year. For this reason, we cannot set excessively high or urgent demands on nonproduction construction projects. With the exception of the necessary tourist facilities, it is necessary to reduce the scope of construction for building auditoriums, and halls, and to properly limit the construction of residential houses. The focus of urban municipal construction should be placed on infrastructure in the service of production and people's daily life. Other construction projects can be appropriately carried out only when we can afford them. 3) The funds for upgrading and transforming enterprises should be used in technological transformation of enterprises; they should not be used in capital construction projects. The focus of technological construction should be placed on improving product quality and properties, increasing variety, reducing material and energy consumption, stepping up the ability to earn foreign exchange through export, and increasing the output of readily marketable products. We should not expand capacity to produce goods in excess supply. 4) It is necessary to properly increase investments in agriculture, science, and education.

In the Seventh 5-Year Plan period, we should arrange construction projects in strict accordance with the principle of "acting within our capabilities." At the same time, we should conscientiously make preparations for projects by establishing a system of seeking advice for, assessing, and examining the projects and gradually organize all construction projects according to a rational time limit. Energetic efforts should be made to institute various forms of the contracted investment responsibility system and the system of inviting and submitting tenders for construction and design, to further improve design and construction management, and to gradually change the situation marked by numerous construction projects, long construction cycles, and poor investment returns. It is also necessary to conscientiously sort out the projects under construction. Those projects which do not have the necessary conditions for construction and production, which yield poor economic results, and which apply backward technologies and techniques, as well as those unnecessary, duplicated construction projects, should be resolutely suspended.

3. Vigorous Efforts Should be Made to Develop Science, Technology and Education

The fulfillment of the Seventh 5-Year Plan and the rejuvenation of the Ningxia economy depend on the development of science, technology and education. A key to narrowing the technological and management gaps between our region and other parts of the country and foreign countries lies in the development of intellectual resources and the training of capable personnel. We should attach strategic importance to the development of intellectual resources and the training of capable personnel, which is a task of overall importance, and make conscientious efforts to do it well.

In the Seventh 5-Year Plan period, we should conscientiously implement the principle that "economic work must rely on science and technology and scientific and technological work must be geared to the need of economic construction," vigorously spread and apply scientific and technological inventions, adopt advanced and suitable technology, and transform the traditional industries. We should organize forces to tackle major scientific and technological problems vital to our economic construction and social development, particularly the breeding of improved varieties of major crops, fowl, and livestock, regional comprehensive improvement, the utilization of coal, nonmetallic ores, and other natural resources, and intensive processing of farm and sideline products. We should strive to attain major achievements in scientific research and quickly transform them into practical productive forces. Conscientious efforts should be made to carry out the "Spark Plan," to develop suitable technology characterized by a "short construction cycle, small investment, and quick economic returns," and reinforce township enterprises and small- and medium-sized enterprises. We should pay close attention to fulfilling the tasks laid down in the plan, such as the five key fields of development, the 63 standby projects, and the training of 15,000 technicians. It is necessary to develop various technological markets, to improve the circulation of technological inventions, and to vigorously develop entities combining scientific research, teaching, and production.

In the Seventh 5-Year Plan period, we should energetically and steadily develop educational undertakings in our region on the basis of conducting the reform well and improving the teaching quality. We should make a clear-headed appraisal of the situation marked by the largest number of children entering kindergartens and schools in the near future, the low proportion of school-agers, and the poor teaching quality. We should proceed from the development of child-care centers and kindergartens and preschool education and, on the basis of consolidating and universalizing primary education, carry out 9-year compulsory education energetically and systematically from one locality to another. We should make primary education universal in Yinchuan and Shizuishan by 1988 and make secondary education universal by 1990. Primary education should be made universal in other cities and counties of the plain area by 1990 and great efforts should be made to increase the proportion of school-agers entering schools or schools of a higher grade in the mountain areas in the south. We should continue to adjust the structure of secondary education, vigorously develop vocational or technical education, and strive to increase the number of students of various vocational and technical schools pursuing senior middle school courses in cities, in most counties irrigated with the waters of the Huang He, and in plants, mines, and other enterprises, so that they will be more or less equal in number to the students recruited by senior middle schools. Vigorous efforts should be made to develop adult education and to step up the part-time training of personnel in order to improve their cultural and professional competence. At the same time, we should reform the labor employment system in line with the principle of giving pre-employment training. Further efforts should be made to reorganize and improve higher education, to concentrate our forces on running existing institutions of higher learning well, to rely on the tapping of potential to increase the number of students, and to pay more attention to adjusting the structure of higher education and improving the quality of education. It is necessary to vigorously develop various forms of higher education, such as radio, television, correspondence, sparetime education, and independent studies, in order to train a large number of high-level professionals for our economic construction. We should continue to adopt special policies and effective measures to speed up the development of higher education and to continuously raise the cultural level of the minority nationalities.

4. Make Efforts to Blaze a New Trail in the Work of Opening Up to the World, Energetically Expand Foreign Trade as well as Economic and Technological Exchanges

Energetically improving our ability to increase foreign exchange earnings through exports is the key to opening our region wider to the outside world, to developing international economic and technological cooperation, to making further technological progress, and to invigorating the economy. During the Seventh 5-Year Plan period, the total value of our region's foreign trade and exports will increase by 29 percent annually on the average and will amount to $115 million by 1990. To realize these targets, we should adopt a correct strategy with regard to the mix of our export commodities, the arrangements for producing export commodities, and the exploration of the international market, and this strategy should be suited to the demand of the international market and our region's actual conditions. We should continue to expand the exports of agricultural, sideline, and native products such as rice, Chinese wolfberries, licorice roots, hair-like vegetables, asparagus, ferny vegetables, wickers, sheepskin, and carpets, as well as textile and other light industrial products. We should bring into play the superiority of our region's energy and resources, energetically expand the exports of Taixi coal and iron alloy, coal chemicals, and tires, and build a 1-million-ton anthracite export basis by the end of the Seventh 5-Year Plan period. These are keys to realizing the above foreign trade and export targets. We should place the development of export machinery and electrical products in an important position and gradually expand the exports of ball bearings, numerical control machine tools, and material testing machines. We should strive to explore the exports of new products, improve the quality of products, and develop key products so that they form the mainstay of our region's export commodities. We should gradually shift from the exports of raw materials and elementary products to the exports of manufactured products and from the exports of roughly processed products to the exports of intensively processed products. In the course of consolidating and developing trade with Hong Kong, Macao, Western Europe, and Japan, we should expand our trade with the Soviet Union, Mongolia, and East European countries. In particular, being a Hui nationality region, our region should find a way into the Middle East market. We should rationally arrange the production of export commodities, build a number of production bases for export commodities, specialized factories (sites), specialized mines, and specialized workshops, and form a production system for industrial and agricultural export products with local characteristics. We should work out and implement the policy which encourages the production of export commodities and helps increase foreign exchange earnings. Economic and trade departments should use both economic and administrative means to strengthen the region's foreign trade work and their leadership and management over foreign trade enterprises, bringing into play the initiative of these enterprises and persisting in a unified foreign trade policy. We should build a foreign trade information network, perfect the sales and service network, and fully display the role information and circulation channels.

During the Seventh 5-Year Plan period, we will open our door wider, adopt preferential policies, introduce more foreign capital, import more advanced technology, and expand our labor service cooperation with foreign countries and the work of contracting for projects abroad. In using foreign capital, we should be both active and cautious, earnestly engage in the feasibility study of projects, and take full account of the region's ability to repay foreign debts. The use of foreign capital should be concentrated on the construction of basic facilities such as energy and communications. In the course of introducing advanced suitable technology, we should carry out technical transformation in our enterprises, make priority arrangements for the production of small import substitutes which help increase foreign exchange earnings, and pay attention to assimilating and absorbing the technology introduced. We should develop our friendly cooperation and relations with Islamic countries, and in particular with Islamic countries in the Gulf area in the Middle East. We should also expand our labor service cooperation and economic and technological exchanges with them. In addition, we should energetically build more scenic and tourist spots.

For Ningxia, it is easier to open up to other provinces than to the world. Therefore, we should focus more attention on opening up to other provinces and on developing lateral economic integration in and outside the region. We should be aware of the fact that our region has many favorable conditions for developing lateral economic integration: 1) Quite a number of large- and medium-sized enterprises which were transferred from the coastal areas in the 1960's maintain close ties with old factories and cities in the eastern coastal areas in terms of production, technology, and sales; 2) a number of key enterprises have the superiority of developing lateral economic integration, producing brand-name products, and forming group enterprises; 3) quite a number of small enterprises and township enterprises which are operating with the support provided by the coastal areas are gaining experience in forming lateral economic integration; and 4) there are rich resources of coal, electric power, mineral products, as well as agricultural, forestry, animal husbandry, and sideline products. We should make full use of these favorable conditions and expand our crosswise economic cooperation with other provinces and regions and the coastal cities so as to increase our vitality and improve our competitiveness. We should break away from the confinement of regions, trades, departments, and ownership systems and develop multi-tier, multi-channel, and multi-form integration. We should further implement the principle of "enabling riverside areas to bring along mountainous areas" and should promote integration and cooperation between cities and counties, between urban and rural areas, and between riverside and mountainous areas. Cities and counties in the region should bring their superiority into full play and strengthen their cooperation and integration in the fields of production, circulation, science, and technology and in using talented people, so as to develop the region's economy. Enterprises should carry out various forms of integration under the principle of "mutual benefit and common development" and on the basis of voluntary participation. We should energetically develop enterprise combination bodies with large- and medium-sized enterprises as the backbone, and brand-name products playing the leading role. We should give more guidance to and strengthen the management of lateral economic integration and work out policies and measures for encouraging economic integration.

5. Strengthen Leadership, Adopt Effective Measures to Promote Economic Development in the Southern Mountainous Areas and to Change the Backward Features of These Areas as Soon as Possible

The southern mountainous areas have witnessed economic development over the past few years but have not freed themselves from poverty. We should adopt a correct policy and measures to change their production and transportation conditions, to speed up their economic construction, and to solve their problems of having enough to eat and wear."

6. Continue to Improve the People's Material and Cultural Life on the Basis of Developing Production

During the Seventh 5-Year Plan period, we should constantly enhance the consumption level of the urban and rural people by developing production and improving economic results. The peasants' per capita annual net income from production has been planned to increase by 7.2 percent and to reach 400 yuan by 1990. The average wages of staff and workers will register an annual increase of 4.9 percent. Employment will be given to 110,000 people in cities and towns. During the 5 years, the region's per capita consumption level will increase by about 5 percent, basically in harmony with its per capita national income. We should correctly understand the relationship between production and consumption and that production, construction, and the improvement of livelihood should coordinate with each other. We should do a good job in ideological and political work so that the masses understand that the standard of living can be improved only step by step. Only by developing production and producing better economic results, can we improve the people's livelihood. On no account should we have excessive demands for the improvement of life.

To improve the people's livelihood, we should organize the production and supply of consumer goods in line with the needs of the people. We should do a good job in the production of vegetables, meat, eggs, milk, and fruit so as to guarantee the supply of these products for the urban and rural markets. Catering to the needs of the market, industrial departments should conscientiously develop new varieties of products and explore new production categories apart from increasing the production of marketable products for daily use. They should seek sources of goods through various channels in order to meet the people's increasing needs and should, in particular, pay attention to transporting industrial products to the rural areas. State-run commercial enterprises should take an active part in regulating the market and controlling prices so that they can fully display their role in leading the market. Industrial and commercial administrative and managerial departments at all levels should strengthen their management over market places and resolutely stop lawless merchants and peddlers from engaging in deception, hiking prices, and harming the masses. Price control departments should rely on the masses in exercising management, inspection, and supervision over prices.

We should conscientiously develop various social undertakings so as to meet the people's increasing needs in cultural life. Cultural and art departments should produce more and better artistic works in order to enrich the people's cultural life. By 1990, telecasts will be made available to 80 percent of the region, and people in the riverside areas will have three channel selections for television programs. This year, we will strive to provide people in the southern mountainous areas with two television channels. We should extensively and profoundly launch the patriotic health campaign, further develop medical and public health work, and improve the people's health. We should continue to do a good job in family planning, to encourage the production of healthy offspring, to effectively control population growth, and to improve the quality of the region's population. We should energetically carry out mass sports activities, improve sporting skills, and do a good job in building sports facilities. We should form and perfect various insurance systems in line with the strains of the state, the collective, and the individual. We should gradually improve and perfect the social welfare system and further develop social welfare undertakings. We should strengthen environmental protection work, exercise effective control over pollution, do a good job in afforesting the urban and rural areas, and continue to improve the living conditions of the urban and rural people. Attention should be paid to the use of electric cookers on a trial basis. There is much coal in Ningxia, with which electric power can be produced for the benefit of the people. This work should start as early as possible with the support by the leading department of the central authorities concerned.

To successfully realize the Seventh 5-Year Plan, it is necessary to pay attention to the following points:

1. Strengthening the Socialist Legal System

Comrade Deng Xiaoping recently pointed out: "In carrying out the four modernizations, we must have dual tactics. These dual tactics refer to paying attention to construction and the establishment of the legal system." This is an important policy drawn up in line with the needs for the four modernizations on the basis of summing up the party's experience in socialist revolution and socialist construction over the past decades. It has provided a theoretical basis for our legal work in the new period. During the Seventh 5-Year Plan period, we should adapt ourselves to economic structural reform and the development of economic construction. Taking Comrade Deng Xiaoping's "dual tactics" as our guiding principle, we should devote more efforts to establishing the socialist legal system, and the socialist economic legal system in particular, and strive to realize the strategic target set by the national conference of party delegates that a "comparatively perfect economic legal system should be established during the Seventh 5-Year Plan period," so that we can make the legal system an important means for regulating economic relationships and economic activities.

2. Changing the Function of Government Organs to Manage the Economy, Energetically Improving Work Style

During the Seventh 5-Year Plan period, state management over enterprises will gradually shift from direct to indirect control. For this reason, government organs at various levels in our region should seriously implement the stipulations of the "Decision of the CPC Central Committee on Economic Structural Reform" concerning the eight functions of government organs in exercising economic management. They should further delegate power to the lower levels, gradually reduce their administrative intervention in enterprises, simplify intermediate administrative levels, shift their main efforts to overall planning, to ensuring the implementation of policies, to organizing and coordinating enterprises, to providing service, to applying economic regulatory means, and to exercising inspection and supervision. They must change the situation in which they lack experience in and methods for exercising macroeconomic control. According to the arrangements by the CPC Central Committee and the State Council, we should further reform government managerial organs at various levels in a planned way and step by step, simplify administration, strictly control the increase in the number of personnel in government organs and undertakings, and gradually form an administrative managerial system under which functional division is explicit, organs are coordinated, operation is flexible, and work efficiency is high.

3. Bring Into Play Forces in Various Fields, Promoting the Region's Economic and Social Development

To fulfill the tasks set by the draft of the Seventh 5-Year Plan and to enable the regional economy and other undertakings to rapidly develop within these 5 years, we should bring into play the initiative of people in various fields, enable the state, the collective, and the individual to go ahead in harmony, pool the wisdom and efforts of the masses, change the habit of relying on the state in investment and construction, and speed up the development of the economy, science, technology, and culture. Within these 5 years, the region should concentrate its financial and material resources on economic construction and reforms. Over the past few years, most of the cities, counties, and enterprises in the region have witnessed marked increases in their mobile financial resources. Therefore they can engage in local undertakings independently according to their economic capability. In using their mobile financial resources for construction, cities, counties, and enterprises should strictly observe the state's macroeconomic policies, take account of the overall results of the region's national economy, abide by the region's long-term plans, and avoid acting blindly. They can seek local interests on condition that they give consideration to the overall situation and do not harm the overall interests. Because the funds for state and regional key construction projects will continue to be short, it is necessary to encourage cities, counties, and enterprises to concentrate their funds on urgent state construction projects.

4. Devoting More Efforts to Socialist Spiritual Civilization

In carrying out material civilization, it is necessary to devote more efforts to socialist spiritual civilization. This is our long-term strategic principle. During the Sixth 5-Year Plan period, we did a great deal of work and achieved marked results in bringing about a fundamental turn for the better in party style, the general mood of society, and social order. During the Seventh 5-Year Plan period, we will continue to resolutely carry forward the two civilizations drive.

The development of reforms and construction has led to major changes in the people's economic life. It will also bring about profound changes in their ideas, spiritual life, and life style and require them to have higher political consciousness and better cultural accomplishments. In line with the requirements of the new historical period, we should strengthen ideological and political work and give more education concerning policies and the situation to cadres, staff members, and workers so that they correctly understand and implement the policies, principles, and measures of the state. We should eliminate the vestiges of feudal ideas, resolutely resist the decadent bourgeois ideas, bourgeois life style, and bourgeois liberalization, and oppose the idea and practice of "putting money above everything else" and seeking private gain at public expense. We should adopt various methods to carry out education in patriotism and collectivism, education in adhering to the four basic principles, and education in having lofty ideals, good morality, strong discipline, and more knowledge, so as to help cadres and the masses foster the great ideal of communism, observe social morality and professional ethics, and bring into play their great enthusiasm and pioneering spirit in building Ningxia. We should pay full attention to the education of the young. Schools, society, and families should closely cooperate in launching educational activities suited to the characteristics of young people and should educate young people to cherish great ideals and foster the spirit of dedication to the socialist cause. We should continue to carry out the activities of "five stresses, four beauties, and three loves" and of building civilized units. All departments engaged in the production and dissemination of spiritual products should straighten out their guiding principles, persist in the four basic principles, serve the people, give priority to social benefit, and produce more and better spiritual products.

Government organs at various levels should take the lead in strengthening socialist spiritual civilization and rectifying unhealthy practices. Government functionaries have done a great deal of work and made remarkable achievements in implementing the party's policies and principles, straightening out their work guidelines, holding firm to reforms, developing production, and servicing work at the basic levels. A large number of fine party members and cadres have emerged. The main trend is good. However, we should soberly understand that some government organs and departments still have quite a number of problems with their work style. Corrupt practices can even be found in these organs and departments. Some cadres are in low spirits, are seriously influenced by bureaucratism, and are irresponsible about their work. Some have a poor sense of organization, spread pessimistic feelings among the masses, and implement the party's policies and principles at will. Some have serious individualism and abuse their power for personal gain. Some appoint people regardless of party spirit or principles. Some take bribes. Some copy and show obscene videotapes. Although these practices are found among a small number of cadres, they have marred the reputation of government organs, harmed the general mood of society, and weakened the people's confidence in reforms and the four modernizations. We should adopt effective measures and resolutely correct these practices. The rectification of unhealthy tendencies and the elimination of corrupt practices should start from leading organs, and in particular from leading organs at the regional level. So far as leading cadres are concerned, leading cadres at the regional departmental and bureau levels should take the lead in rectifying unhealthy tendencies and eliminating corrupt practices. They should be strict with themselves and set a good example for others. Apart from not going in for unhealthy practices, responsible cadres at all levels should educate their children and relatives not to be involved in unhealthy practices. In addition, they should also subject themselves to the supervision by the masses. In examining unhealthy practices, we should be bold in breaking away from kinship and resolute in resisting the habit of interceding. Unhealthy practices should be seriously criticized and dealt with, no matter who is involved. A criminal offender must be dealt with according to law. On no account can a fine substitute for his crime, still less can a disciplinary punishment replace a criminal sanction.

In the course of spiritual civilization, we should further strengthen the unity between various nationalities and develop a socialist relationship between them. Government organs at all levels should conscientiously implement the law of regional autonomy on minority nationalities, correctly understand and carry out the party's policies on nationalities and religions, promote and strengthen the unity between the Han and minority nationalities and the unity between minority nationalities themselves, consolidate and develop the political situation of stability and unity, and create an excellent social environment for economic invigoration in minority nationalities areas.

Commanders and soldiers of the Ningxia Military District and army units stationed in Ningxia have made great contributions to defending the motherland, to streamlining and reorganizing the army, to strengthening their own building, to carrying out spiritual civilization in the army and the localities, and to supporting local economic construction. Public security officers have devoted their efforts to preserving social order. During the Seventh 5-Year Plan period, it is necessary to further strengthen the unity between the army and the government and between the army and the people and to draw up greater plans for Ningxia's construction.

Fellow deputies!

This is the first year of the Seventh 5-Year Plan. We should conscientiously consolidate, assimilate, enrich, and improve what we have achieved in reforms, strengthen and improve macroeconomic management, promote the stable development of the national economy and undertakings in various fields, and make a good beginning in implementing the Seventh 5-Year Plan.

So long as the people of various nationalities in our region are united and continue to work in the spirit of the old man who removed the mountains, the Seventh 5-Year Plan will be fulfilled to our satisfaction and the region's socialist modernization will forge ahead, thrive, and bring about changes day after day.

ECONOMIC PLANNING

GUANGZHOU YANJIU ON URBAN DEVELOPMENT STRATEGY

HK200445 Guangzhou GUANGZHOU YANJIU in Chinese No 4, Apr 86 pp 4-9

[Article by Li Mengbai [2621 1125 4101] of China Urban Science Association: "Urbanization and Urban Modernization in China"--first paragraph is introduction]

[Text] "With a change in the relations between town and country, the features of all society will also change." ("Poverty of Philosophy" by Marx, "Collected Works of Marx and Engels," Vol 4, p 159) Therefore, in studying social developments, we cannot do without the study of changes in urban and rural development and without the study of "urbanization" as a natural historical process of social development. With China's society in the new historical period of socialist modernization, the pace of urbanization is accelerating. The problem of urban modernization facing us has assumed increasingly serious proportions. This article is an attempt to link China's economic and social development with the study of the problem of China's urbanization and urban modernization, in order to arouse the attention of a large number of readers to this matter.

Cities' Role in Our Country's Modernization

As centers of a state or region, contemporary and modern cities generally have such superior features as industrial concentration, brisk trade, a proliferation of talent, thriving science and technology, a well-developed transportation system, easy access to information, an ample supply of capital, and so forth. Therefore, relatively speaking, they can always use a relatively small amount of labor in material form and live labor to realize relatively great economic results. In a relatively short period of time, they can organize large-scale production and circulation of commodities and support agricultural production and rural construction with various means of production, means of subsistence, necessary technology, information, and equipment, thus stimulating the development of the national economy as a whole.

Conditions of economic and cultural development in our cities also show that cities play an important role in urban economic and social development. According to statistics compiled of about 266 cities at the end of 1983, the combined population of these large and small cities accounted for 10 percent of the total national population. The number of workers employed by industrial enterprises and the original value of fixed assets respectively represented two-thirds of the state's total. The realized total industrial output value accounted for 84.6 percent of the state's total. Profits and taxes handed over represented 85.3 percent of the state's total. The total retail sales of social commodities accounted for 63 percent of the state's total. The number of teachers and that of students in institutes of higher learning respectively represented 95 percent of the state's total. The number of medical and health organs and that of hospital beds respectively accounted for more than 40 percent of the state's total. Most scientific and technical personnel were in cities. From this, it can be seen that cities play an unusually important role in the economic and social development of our country. In modernization, a doubling of industrial production chiefly depends on cities. A doubling of rural production calls for the overall development of mass agriculture and also for the support of cities. The realization of the modernization of science and technology in particular--which is the key to modernization in four respects--depends on cities all the more. In sum, the city is an important base for our building a high level of material civilization and socialist spiritual civilization. The proper handling of urban planning, construction, and management has a great bearing on the modernization of our country.

The Trend in the Development of Our Towns and Cities

Since the founding of the PRC, tremendous achievements have been scored in our urban construction effort. Cities left over from the old China have been transformed. There has been a purge of accumulated social filth of many years. Production has shown development. New spiritual civilization has been created. Qualitative changes have been brought about in these cities. Meanwhile, with the industrialization of the state, a number of new cities have been set up. The number of cities has doubled. In 1949, the whole country had only 140 cities officially established as such, and about 2,000 county towns or towns included in a system. The total city and town population stood at about 57.65 million, which accounted for 10.6 percent of the then total national population. By the end of 1984, the number of cities officially established as such throughout the country had risen to 300. The number of towns included in a system had shot up to 7,469. The total city and town population had reached 163.01 million, or 15.82 percent of the total national population.

The history of urban development in the 35 years since the founding of the PRC shows that our economic and social development is undergoing a process of urbanization. "Urbanization" is in the category of history. It has arisen with industrialization. It first appeared in Western Europe, the source of the contemporary industrial revolution, and then gradually caught on in various other continents, bringing about a quick increase in the number of cities in the world and the urban population. Given the different process and pace of industrialization in various countries, the pace of urbanization and the concrete road followed have varied. Many scholars in our country suggest that the term "urbanization" be changed to "chengzhenhua" [1004 6966 0553]. Instead of simply meaning concentration of the population in cities, the term should also take on the additional meaning of urbanizing the way of life of the rural population (including material and spiritual life). This means that people in the countryside can also enjoy urban civilization. I am in favor of this new interpretation. It embodies the hope of myriads of peasants for an improved standard of living. It is in line with the socialist goal of production and the Communist idea of eliminating differences between town and country and especially in line with the fundamental spirit of the call by Marx and Engels for "urbanization of rural areas" and "the integration of urban and rural areas" ("Collected Works of Marx and Engels," Vol 46 (Part i), p 480; Vol 20, p 321).

It should be pointed out that our current level of urbanization is not high. On the one hand, according to the 1982 census, our urban population constitutes only 20.6 percent of the national population (this figure includes the agricultural population in the suburbs of cities, different from other statistical figures listed above), which is much lower than in the developed countries. It is also very low when compared with the world's average, which is 42.2 percent. On the other hand, China has 20 super-large cities, each with a population of more than 1 million, ranking first in the world. The problems in this respect are: 1. the scales of the cities are not reasonable; 2. population and industry have been excessively concentrated in large cities. There are many problems in urban construction and the management system. In addition, for a rather long time in the past, under the guidance of the "leftist" ideology, we only attached great importance to industrial development to the neglect of urban construction and attached importance to production to the neglect of improving livelihood. We did not pay attention to overall planning for the development of cities and urban districts, resulting in the very unreasonable distribution of cities, disorderly layout of urban districts, serious insufficiency in dwelling houses and basic facilities, shortage of water and energy supply, traffic jams, poor communications, serious pollution, and generally low economic returns. In short, the quality of cities is comparatively low, not suiting the needs of economic and cultural development and improvement of the people's livelihood. It has even become "an obstacle for further development."

By the end of this century, China's population will reach 1.2 billion, and its total industrial and agricultural output value will be quadrupled. This great change in population and economy will inevitably promote the process of its urbanization. According to calculations of the relevant department, along with continuous and vigorous development of the rural economy, there will be at least 200 million surplus agricultural laborers in the coming 16 years, who will move from the countryside to the cities and engage in industrial production or other trades. Probably, about 60 percent of the national key construction projects except for railways and communication projects will be attached to the existing large and medium-sized cities, while some 30 percent of them will be built in small towns and cities or outside towns and cities. Implementation of the policy of opening up to the outside world will inevitably result in population growth in coastal cities. This situation dictates that the population and areas of certain towns and cities, including some large cities, will continue to grow, and some new towns and cities will be established. This is an inevitable and irresistible trend. In view of China's concrete situation and national strength, and based on the strategy and plans for its economic construction in the coming 16 years, the most possible situation will be: On the premise that population growth is strictly controlled, the economy and society of the existing super-large cities will be gradually developed toward the orientation of high efficiency and high quality and the population will slightly grow; the population of the existing large and medium-sized cities will grow under control, of which the 7 large cities with a population over 900,000 will be developed into super-large cities with a population over 1 million, the 14 medium-sized cities with a population of over 400,000 will possibly be developed into large cities with a population of over 500,000, and the 40 small cities with a population of over 150,000 will possibly be developed into medium-sized cities with a population of over 200,000; and a number of the 7,469 towns will be upgraded and become cities. In the past 5 years, an average of 12.8 small cities were established each year in our country. Based on this development, it is possible that in the coming 16 years, some 208 small cities will be further established, at an average of 13 each year. Of the more than 53,000 market towns in the countryside, those with better conditions and faster development can be changed into towns. Based on this estimation and in accordance with the principle of "leaving agricultural production without leaving one's home village," some 30 percent of the 200 million surplus rural laborers can be accommodated in the rural market towns, and 60 percent of them will settle down in the nearby small cities and towns. The number of these laborers entering into large and medium-sized cities will be controlled at about 20 million, or 10 percent. In addition, there will be natural population growth in cities and towns. Thus, by that time, China's total urban population could reach 372 to 396 million accounting for 31 to 33 percent of the total population. This is probably more suited to our policy on the development of cities and towns. Meanwhile, this trend of development also requires us to study and work out a correct strategy for urban development.

The Basic Policy for China's Urban Development

The basic policy for China's urban development is "to control the scope of large cities, to rationally develop medium-sized cities, and to vigorously develop small cities." This policy was put forward by the national urban planning work conference in October 1980 and approved by the State Council. Since it is of great guiding significance to the overall development of cities (this is the focal point) as well as to urban planning and urban construction in the whole country, it is called "the basic policy for urban development." It is not a concrete policy for a certain aspect of things (such as planning or management), but a general guiding policy. While providing an important guiding ideology for China's urban development strategy, it also gives different principles for the development of large, medium-sized, and small cities. It was formulated on the basis of summing up our experiences and lessons in urban construction since the founding of the state, by studying the situation and experiences of other countries in urban development, and in light of China's concrete national situation and the needs of socialist modernization construction.

"To control the scope of large cities" mainly refers to controlling the population of large cities. Historical experience in the world's urbanization over the past two centuries shows that the excessively large size and population of the cities create many defects which may bring about a series of difficult problems to solve. For this reason, we stand for strictly controlling the population in large cities. The main points are as follows: 1) to determine the general population scale for the coming years through overall planning so as to carry out control; 2) to stress controlling the mechanical growth of population while exercising control over natural growth through family planning; 3) to take as our purpose preventing the unrestrained growth of the urban population rather than exercising rigid control over the population size and excluding any necessary growth or decline; and 4) to follow a policy of dispersal while controlling population growth so as to distribute the population from large cities to small cities and towns. A correct understanding and implementation of the policy of "controlling the scope of large cities" will not hinder the economic and cultural development of large cities, but can ensure their healthy and rational development and give fuller play to the role of these cities.

"To rationally develop medium-sized cities" requires that we change our past practice of laying particular emphasis on the development of large cities to the development of medium-sized cities, so that the latter can be rationally developed. The main points are: 1) to make use of the relatively good conditions of medium-sized cities in production, circulation, and service, and their superiority in regard to population, and to make some projects that are urgently required by the development of the national economy develop there so as to win the race against time and to prevent some of the defects of large cities; 2) to make economic construction develop harmoniously with the construction of various basic facilities so as to prevent "outstanding accounts" in urban construction; 3) the population and areas of the cities must not be expanded without restraint, and unless absolutely necessary, they must not be developed into large cities, especially super large cities; and 4) in a few years, some small cities with good conditions may be gradually developed into medium-sized cities in a planned way.

"To vigorously develop small cities": The "small cities" mentioned here refer to cities with districts, county seats, towns, independent industrial and mining areas, and town- and city-type residential areas with a population under 200,000. We are now used to including rural market towns (usually the locations of township government and areas where township industry is concentratedly developed, which are regarded as reserve positions for developing towns and cities) in this category and generally call them "small cities and towns." Thus, "to vigorously develop small cities" is often interpreted as "vigorously develop small cities and towns." The main points of this policy are: 1) along with the development of the national economy, especially the rural economy, to first do a good job in building the county seats and towns, paying special attention to strengthening planning and management and the construction of basic facilities so as to suit the needs of continuous economic and social development; 2) to establish satellite cities around the large cities so as to take the pressure off large cities; 3) to develop some small cities with good conditions into medium-sized cities if necessary and possible, but main efforts should be made to improve the facilities and functions of the cities rather than pursuing an increase in population and land; and 4) to gradually upgrade towns or county seats with good conditions to cities and well-developed rural market towns to towns so as to gradually increase the number of small cities and towns.

Tentative Ideas on the Strategy for China's Urban Development

Since the 3d Plenary Session of the 11th CPC Central Committee, the central authorities have put forth a series of demands for China's urban development, such as: It is necessary to do a good job in urban planning, construction, and management; to attach importance to the role of cities; to make the cities bring along the counties and lead the countryside; to take the cities, which are comparatively well-developed, as the core so as to bring along the rural areas around them; to organize production and circulation under unified leadership; to gradually establish all kinds of economic zones and networks attached to and supported by the cities; to give play to the superiority of the coastal cities and to vigorously promote foreign trade, international economic cooperation, and technological exchange in these cities while encouraging them to carry out effective cooperation with the hinterland so as to bring along the economic development of the latter; and to vigorously develop small cities and towns so as to promote rural economic and cultural development and absorb the surplus labor in the countryside. These demands, which, proceeding from the strategy for the economic and social development of the whole country, present tasks for cities and towns in the new historical period and place them in a position of leadership over the countryside, form an important guiding ideology in studying and drafting the strategy for the development of cities and towns in our country. In his opening speech at the 12th CPC National Congress, Comrade Deng Xiaoping said: "We must proceed from China's reality in our modernization drive," and "must combine the universal truth of Marxism with China's concrete situation and follow our own path in building socialism with distinctive Chinese characteristics." This is the fundamental guiding ideology for us in studying and drafting the strategy for our development of cities and towns.

According to this guiding ideology, the strategy for China's development of cities and towns in the new historical period should be as follows: Proceeding from our national situation and serving the fulfillment of the general task put forward by the 12th CPC National Congress, we must adhere to the policy of "controlling the scope of large cities, rationally developing medium-sized cities, and vigorously developing small cities." We must follow our own path in building cities and towns with distinctive Chinese characteristics and gradually establish a multilayered and pagoda-type structure with super-large and large cities as the core, medium-sized cities as the backbone, small cities and towns as the bases, and rural market towns (the reserve positions for cities and towns) as the cells. This is characterized by the rational distribution of all kinds of cities and towns, including super-large cities, large cities, medium-sized cities, small cities, county seats, towns, and rural market towns. Thus we will be able to bring along the vast countryside and promote the harmonious development of both urban and rural economy and society so that they may march toward modernization at the same pace.

The objective of struggle for this century is: By the year 2000, all the cities in our country, especially large and medium-sized cities, should be built into clean, quiet, beautiful, and advanced positions with sufficient basic facilities, which are capable of playing their role as guiding centers in the construction of the four modernizations. Small cities and towns can also take this objective as their reference point to gradually improve their levels.

Under the guidance of this strategic thought, while developing our cities and towns we must never repeat the old path of certain countries which have blindly developed large cities and allowed the surplus laborers in the countryside to flow into large cities unrestrained, but must take serious measures to control the scope of large cities and develop various kinds of cities in a planned way, laying stress on the development of small cities. We must first strengthen the construction of the existing cities and towns. We must not only forcefully develop industry, communications, trade, finance, and tourism in these cities in light of the necessity and possibilities of our modernization drive, but must also forcefully promote the development of science, education, culture, public health, and information, as well as various public facilities serving production and life, and strengthen the construction of various kinds of basic facilities. This will allow these cities to give full play to their role as centers of various regions. Large cities, especially super-large cities, must be developed with the idea that the scope of the population will be strictly controlled, and with stress on improving their functions, layout, and level of modernization, so that they may give better play to their role as "key cities." When developing the economy, especially when developing industry in large cities, we must give priority to the production of high-quality, precision, advanced, and new products. We must carry out technical transformation and follow the road of intensive and expanded reproduction. We must rely on policies, science, and technology and make great efforts to improve the industrial structure and technological makeup so as to gradually increase labor productivity and overall economic returns. While strengthening their own strength, increasing their level, and providing the state with more accumulation, they must also provide the areas around them and medium-sized and small cities (and even the whole country) with advanced technology and equipment as well as technical personnel and necessary financial and material resources, so as to help these areas and nearby cities and towns advance at the same pace. They must not merely consider their own problems concerning quadrupling the industrial and agricultural output value or merely compete with other cities and areas in this respect. The development of medium-sized cities must also follow these principles. Population control in these cities may be appropriately relaxed. However, they must not be developed into large cities, especially super-large cities. If conditions allow, the number of medium-sized cities may be appropriately increased. In our country, which has a large population, more medium-sized cities may help lighten the burdens of large cities and promote the economic and cultural development of nearby areas and small cities and towns.

At the same time, we must forcefully promote the construction and development of small cities and towns (including county seats, towns, and rural market towns with better conditions). Relying on small cities and towns to develop the economy and cultural and educational undertakings is conducive to the rational distribution of the productive forces, population, and cities and towns throughout the country. It is conducive to strengthening ties between town and country and promoting the economic and cultural development in the countryside and the realization of the modernization of agriculture. It is also conducive to absorbing surplus agricultural laborers in the nearby countryside so as to effectively control the scope of the population in large cities. Compared with the construction of large and medium-sized cities, the construction and development of small cities and towns need less investment but yields quicker results. It suits China's national situation and the needs of developing the rural economy. It is of important significance to gradually reducing the distinction between town and country, promoting their harmonious development, increasing the cultural level and living standards of the whole nation, and blazing a new trail of building cities and towns with distinctive Chinese characteristics.

All cities and towns must implement the principle of "developing strong points, overcoming weak points, and giving play to superiorities" in their construction and development, and set a correct orientation for their development. According to our historical experience, we must not require that all cities be developed into "all-round" cities, but must set different orientations, focal points, scopes, and speeds for their development in light of their respective characteristics and conditions.

Endeavor To Realize the Modernization of Cities

Another important question in studying the strategy for urban development is how to realize the modernization of the cities. Since science and technology have been developing at full speed, the internal movement and external relations of the cities, which are organic and comprehensive bodies and a large system of the economy and society, are also becoming more and more complicated with each passing day. For the modernization of industry, there are some evident signs that we can find in its technological makeup, product mix, degree of automation, and labor productivity, but it is difficult for us to find evident signs of modernization in the cities. At least, they are not as evident as those of industrial modernization. This is because the modernization of the cities, which are comprehensive bodies and a large system, is not only restricted by economic and technological conditions, but also by geographical, historical, and national conditions, as well as the social system and international contacts. From a long-term point of view, the following five conditions are necessary for China's modernization of the cities:

1. A high-degree of socialized division of labor and cooperation: This is not only reflected by production and circulation, but also by life and all kinds of service. It is not only reflected by the cities internally, which have removed the backward phenomena that appeared under the guidance of the old concepts of a small-scale peasant economy and self-sufficiency, such as the phenomena of "being big and complete," "being small and complete," and all factories and schools "engaging in the management of society," but is also reflected by the relationship between cities. With the establishment of various types of economic zones and economic networks, the functions of all cities will be rationally regulated so that the cooperation between various cities may be enhanced and the best possible overall economic results may be achieved.

2. Highly efficient basic facilities: There should be sufficient basic facilities for information, communications, water supply and drainage, and power, heat, and gas supply, as well as for commerce and the service trades. These facilities must be sensitive, convenient, unobstructed, and fine.

3. A high-quality ecological environment: All kinds of pollution in the cities should be generally prevented and cleared away so that a benign cycle

may be maintained in the ecological system and so that the urban residents may live in a clean, beautiful, tranquil, and comfortable environment.

4. A high level of management: While perfecting the legal system and striving to realize the "rule by law," urban management in various fields, including planning, construction, communications, commodity supply, social service, public security, disaster prevention, population control, medical and health work, and labor and equipment, should be put under electronic control so that it may be carried out in a scientific way and become more efficient.

5. A high degree of socialist spiritual civilization: We must not only attach importance to the development of culture, art, journalism, publications, broadcasting, and television, but must also educate residents of the cities in Communism, patriotism, and collectivism through various channels and by various means, so that they may acquire lofty morality and so that a good social atmosphere characterized by "five stresses, four beauties, and three loves" may be fostered.

These five conditions are also symbols of China's modernization of the cities. Their realization required our great efforts. We must realize that improving the quality of cities is an arduous task and that the modernization drive is a dynamic process and a process of continuously advancing from the lower level to the higher level and from popularization to higher standards. We must take a broad and long-term view in making plans for urban modernization and must work out feasible and concrete plans, targets, and measures in light of our real situation at present.

The Objective of Struggle for the Coming 16 Years

In this century, in order to make the quality of our cities suit the targets of quadrupling the industrial and agricultural output values and making the people become relatively well-off in their material and cultural lives, we must gain a full understanding of the relationship of interdependence and interaction between urban construction, environmental construction, and economic construction. We must work out plans for, carry out, and develop the three types of construction simultaneously, so that unified economic, social, and environmental results may be achieved. Since urban construction and environmental construction are inseparable, we must pay greater attention to grasping well both environmental protection and the construction of basic facilities in the cities.

In environmental protection, stress should be laid on bringing industrial pollution under control. It is necessary to strictly control the emergence of new sources of pollution, maintain the ecological balance, and increase our ability to dispose of the "three industrial wastes" and daily garbage in harmless ways and to regenerate and use resources in a comprehensive way, so that the impurities in the urban water system, the content of harmful gas in the air, dust, and noise can be reduced and reach the required standards for environmental protection.

In the construction of basic facilities, it is necessary to make unified planning with due consideration for all concerned. It is necessary to grasp both the transformation of the old areas and the unified development and construction of the new areas and make continuous efforts to improve the efficiency of these facilities. In the coming 16 years, we must particularly pay attention to the construction of basic facilities for communications, water supply, water drainage (including sewage disposal), gas supply, and afforestation. In housing projects, while maintaining the necessary scope and speed, it is also necessary to reform the distribution system and gradually adopt the system of commercialization. By the year 2000, every household of urban residents should have a suitable apartment. In design, for both dwellings and public buildings, it is necessary to take into consideration the long-term needs and the needs of modernization. We must strive to improve the design of houses and build more beautiful houses with both national and local characteristics and rational layouts. We must also change the traditional unchangeable space into flexible and changeable space and reserve necessary space for all kinds of pipes and lines as well as for all kinds of household electric appliances.

It is also necessary to build various service facilities and vigorously develop the service trades so that our production and life may become more convenient.

Judging from the requirements of modern cities, the above objectives are still at a low level. In light of our national situation and strength, we must achieve these objectives.

ECONOMIC PLANNING

CENTRAL CHINA'S ECONOMIC DEVELOPMENT STRATEGY

Hong Kong LIAOWANG [OUTLOOK] OVERSEAS EDITION in Chinese No 5, 3 Feb 86 p 9

[Article by Xia Zhenkun [1115 2182 0981], Senior Economist: "Central China's Integrated Economic Development Strategy"]

[Text] Central China is the middle of China. Objectively speaking, to make national economic structure be truly able to realize the "unification of east and west, the intercourse of north and south," and make economic development have stamina in the east and momentum in the west requires a central Chinese economic group that has internal concentration and external tension. Therefore, studying central China's overall socio-economic development strategy is not only a requirement of every central Chinese province, but is more so a national strategic planning requirement.

Two Kinds of China

At present there are two strategic choices confronting the provinces of central China: "non-integration" or "integration."

To meet the challenge of competitors and seize certain markets and investment funds, the so-called "non-integration" choice means that each province separately opens up to the outside and has even more attractive economic zones. The creation of semi-natural horizontal economic relations cannot be criticized; however, to treat this structure as a kind of strategic principle entails three drawbacks. First, one cannot fundamentally change the economic status of every province. Second, in terms of the national structure, to have a blank center is an unwise strategy. Third, the idea runs counter to the objectively existing traditional relations and development prospects of mutal resource complementation and promotion between provinces.

The so-called "integration" is the formation of a network based on the geography and unity of the three provinces. They extend to Beijing and Tianjin to the north, to Guangdong and Guangxi to the south, Jiangsu and Zhejiang to the east, and approach the great northwest and southwest in the west. The three integrated provinces form a pivot reaching out in all directions and surging in the middle. This plan can avoid the weaknesses of the "non-integration" strategy and alleviate the shortcomings among the provinces. One can say that if the three provinces stand alone, each is weak;

but united they can develop together. For example, Henan's energy resources can ease shortages in Hunan and Hubei. Hubei's iron, steel, autos and science and education can help develop Hubei and Hunan. Hunan's nonferrous metals, agriculture, light and textile industries and technology can benefit the other two provinces. In this way there can be mutual benefit and central China's prominence will speed up.

Multiple Centers; An Omni-Directional Stance

Becausse of geographical and economic factors, the formula for central China's unification at present should not be to adopt one center in an all-or-nothing formula. The best is to make Wuhan, Zhengzhou and Changsha into centers, creating a network out of the three tri-city areas of Wuhan-Xiangfan-Shashi; Zhengzhou-Luoyang-Xinxiang; and Changsha-Zhuzhou-Xiangtan, establishing a kind of multiple-centered, omni-directional loose unification of crisscrossed networks that mutually complement and promote each other by equal cooperation.

Three Great Interlocked Circles

This kind of unified situation varies to a small degree, however, in different circles and neighboring areas are not uniform. The first circle includes all of Hubei, the southern part of Henan and the northern part of Hunan. This circle can implement genuine economic unification and cooperation. The second circle includes northern Hubei, southern Hunan, northwestern Jiangxi, southwestern Anhui, and southeastern Shaanxi. This circle is quite freely defined and can carry out substantial or insubstantial, long-term or short-term, and various kinds of ad hoc cooperation and unification. The third circle can further take in Jiangxi, Anhui, Sichuan, Shaanxi and even more remote provincial areas as marginal border areas. The three circles and the areas outside them are not clearly delineated but fit together jigsaw-like.

Economic Partners Flying Wing-to-Wing

The city and three provinces have an equal partner relationship due to the mutual need for unification. The first circle equally can carry out organized, planned cooperation and unification to provide and transport its comprehensive energy development, car and tractor industries, water and land transport, comprehensive development and processing of nonferrous metals, management of the Dongting Lake water, science and technology news network, researching and popularizing hybrid rice, etc. Unified investment companies or long-term planned contracts can be set up without sticking to a single pattern. Thus we can create central China's economic group on the basis of mutual aid and benefit, equality and self-fulfilment.

ECONOMIC PLANNING

LIAOWANG LOOKS AT CENTRAL CHINA'S INDUSTRIAL SYSTEM

Hong Kong LIAOWANG [OUTLOOK] OVERSEAS EDITION in Chinese No 5, 3 Feb 86 pp 8-9

[Article by Li Yaowu [2621 5069 2976], Lecturer, Wuhan Construction Institute: "Central China's Industrial System Basically Established"]

[Text] Other large economic zones are in planning in the wake of the successive establishment of the economic zones in Shanghai and the northeast and the formation of a cooperative zones in the southwester comprised of four provinces and five localities. Towards this end, the most important component in the creation of a regional economic system is to put research on industrial systems onto the agenda. An understanding of central China's industrial system directly affects such things as the formulation of development strategy, the choice of strategic goals and breakthroughs, and the rational ditribution of productive forces.

The total area of central China's three provinces of Henan, Hubei and Hunan is approximately 560,000 square meters. The total population is 180 million. The appelation of these three provinces as central China is appropriate because the area exhibits "central" characteristics in many respects.

Conditions are quite advantageous for the development of industry in central China. With respect to natural conditions, the area offers geographical advantages. Biological resources are abundant, the geological structure is complex, mineral resources are ample, hydrologic factors are beneficial and water and water power resources are ample. With reference to socio-economic considerations, the agricultural base is quite good, communications and transportation are convenient, commerce and trade are lively, cities are scattered throughout, there are ample human resources and the area occupies a strategic position.

Central China got a rather early start on modern industrialization compared to the national picture. The Hanyang Steel Mill is a major symbol of this early start. Yet in old China, industry here was always unable to achieve its proper development and there was nothing to be said for the industrial system. On the eve of the establishment of new China, the gross industrial output value of the three provinces was less than 1 billion yuan, industrial departments were fragmented, there were no large backbone industries and regional distribution was extremely uneven.

Since the 1950s, China has transferred industry to the inland in a planned way in order to change the irrational situation whereby industry was overly concentrated along the coast. The three central Chinese provinces constitute one of the key construction areas in the drive from north to south and from east to west. Henan, Hubei and Hunan were in third, sixth and eighth place, respectively, in terms of accumulated funds for capital construction among all provinces (areas) nationwide until 1980. The industrial production situation is as follows:

Scale of Production. The original value of fixed industrial assets in the three provinces is approximately 70 billion yuan. The gross industrial output value is more than 85.6 billion yuan, or 12.2 percent of that of the state. Among large areas, the provinces are second only to Shanghai (East China), north China and the northeast, becoming part of the ranks of the four state powers. The output of major industrial goods has already broken through some "big barriers," for example, coal (100 million tons), petroleum (10 million tons), steel (5 million tons), electricity (50 billion kwh), aluminum (60,000 tons), cement (20 million tons), vehicles (60,000 units), tractors (100,000 units), cotton (2 billion meters), paper (1 million tons), cigarettes (1 million cartons), etc. These figures indicate that central China's industrial production is already considerable and quite strong.

Departmental Structure. According to currently used division methods, the output values of light and heavy industry are 48.6 aand 51.4, respectively, or the two are basically balanced. The output value structure of various industrial departments is very close to that of the national situation, indicating a solid synthesis. Ancillary equipment systems for some individual departments or trades is already quite complete and forms a system. For example, in the steel industry, mining, benificiation, sintering, coking, smelting, steel making and steel rolling constitute an integrated system. In the power industry power is uniformly controlled and supplied in a system composed of generation, transmission and supply. The tractor and vehicle industries also are integrated. In general, departmental structure is rather coordinated.

Enterprise Structure. In 1983 there were 200 large- and 475 medium-size enterprises in the whole zone, the output value of which accounted for 44.5 percent of that of all industries in the zone, or practically the same as the national index of 45 percent. There were 13,000 enterprises owned by the whole people that played leading roles and accounted for 81.5 percent of the zone's output value. A group of large- and medium-size enterprises using rather advanced domestic technology played central and leading roles within their trades. The Yimi Qizha Steel Project, the Zhengzhou Aluminum Plant, the Zhuzhou Hard Metal Works, the Zhuzhou Smelting Plant, the Gezhouba Hydro Plant, the Pingwu and Gewu 500,000 volt high-pressure transmission line, the Jingxiang phosphorous and sulfer mine, the Luoyang Tractor Plant, the Zhengzhou No 2 Grinder Works, the No 2 Car Manufacturing Plant, the Zhuzhou Electric Power Equipment Plant and the Yiyang Ramie Textile Works are all leaders in their trades nationwide in terms of the scale of production or productivity. These large backbone industries comprise the framework of central China's industrial system.

Regional Distribution. Based on 1982 data, according to the situation in terms of the concentration of cities, the size of industrial output value, and major departments or trades, central China can be divided into 11 industrial areas in four sectors.

The primary industrial zone (having an output value of more than 10 billion yuan) is the Wuhan-Huangshi industrial area. Most prominent are the steel, machinery, textile and food products industries. The area accounts for 20 percent of the industrial output value of the three provinces, constituting the core of central China's industrial system.

There are two secondary industrial zones (having an output value of 5 billion to 10 billion yuan). The first is the Zhengzhou-Luoyang industrial area, centered around the mechanical, electric power, textiles and nonferrous metals industries. The area accounts for 13 percent of the output value of the three provinces. The second is the Changsha-Zhuzhou- Xiangtan industrial area, dominated by the mechanical, metallurgical, textile and foodstuffs industries. The area accounts for 9 percent of the output value of the three provinces. These two areas form the northern and southern wings of central China's industrial system.

There are two tertiary industrial zones (having an output value of 3 billion to 5 billion yuan). The first is the Xiangfan-Shiyan industrial area, highlighted by the mechanical, electric power and light industries. The output value of the whole area is 6 percent of that of the three provinces. The second is the Yichang-Shashi-Jingmen industrial area, where the electric power, petroleum and textile industries are at the fore. The area produces 5 percent of the output value of the three provinces. These two industrial areas are both growing sectors of central China's primary industrial system as well as rear areas with high development potential.

There are six fourth grade industrial areas (having a general output value of 1 billion to 3 billion yuan). Three are located in Henan Province, namely the Anyang-Hebi-Yima-Sanmen Gorges and the Pingding Mountain-Xuchang-Luo He areas. Three are in Hunan, namely the Yueyang-Yiyang-Changde area, the Shaoyang-Loudi,Lengshui Jiang area, and the Hengyang-Chenzhou-Yongzhou area. They are located in the north, west and southern sectors, respectively, of the two secondary industrial areas. They are expanding portions of the secondary industrial section of central China's industrial system.

In addition there are 15 small cities spread out in every direction that are linked up with neighboring counties to form the core of regional industry.

These four levels of 11 industrial zones are clearly demarcated in area, primary and secondary are distinct, and the general geographical configuration conincides with the ordered boundaries. The regional distribution of industries is generally rational upon reconsideration of the appropriateness of the specialized departments, natural resources, and socio-economic conditions of each province.

Considering that industrial output is on a strong scale, the structure of industrial departments is relatively coordinated, industrial enterprise structure is relatively rational, and the distribution of industrial areas generally is consistent with the allocation of resources, one can say that the foundation for central China's industrial system has been established.

CPC SECRETARIAT, STATE COUNCIL OFFICE SPONSOR SYMPOSIUM

HK160408 Wuhan CHANGJIANG RIBAO in Chinese 7 May 86 p 1

[Report by correspondents Yang Jie [2799 2638] and Jin Xiaozhang [6855 1321 4545] and reporter Qin Xian [4440 0341]: "Nine Cities and Two Provinces Jointly Hold a Strategic Symposium on a New Type of Relationship Between Urban and Rural Areas in the Chang Jiang Valley"]

[Text] The strategic symposium on a new type of relationship between urban and rural areas in the Chang Jiang Valley jointly sponsored by the Rural Policy Research Center of the secretariat of the CPC Central Committee and the Rural Development Research Center of the State Council closed on 7 May after a 5-day meeting. Leading comrades and sociologists of 9 cities and 2 provinces including Shanghai, Nanjing, Wuhan, Chengdu, Chongqing, Jiujiang, Jiangsu, and Hubei attended the symposium.

At a time when the new system of the city exercising leadership over the surrounding counties developed rapidly, the participants, in connection with the development of the new relationship between urban and rural areas, focused their discussions on the coordinated development of industry and agriculture between urban and rural areas, the pattern of new relationship between urban and rural areas, the new problems arising from the market opened for farm and sideline products between urban and rural areas and the measures to be taken, and other issues. The 50 delegates to the symposium submitted around 60 articles and tentative research results which made explorations on a series of questions concerning the development of urban and rural relations.

--In order to establish a new relationship between urban and rural areas, it is necessary to first develop a commodity economy in both urban and rural areas. Apart from performing the functions of large cities, exerting influence on rural areas, invigorating large enterprises, and establishing various multi-functional, socialized, and open economic centers, the most important question is to promote rural industrialization and institute a coordinated urban-rural industrial system. This is the principle to promote the development of the national economy as a whole and to enable the rural economy to catch up with the development of the urban economy.

--In order to establish a new relationship between urban and rural areas, it is necessary to devote a lot of time and energy to unclogging the circulation channels for commodities. The stress should be put on opening various forms of labor, technology, funds, and material markets; eliminating the factors that separate urban from rural areas; smashing the old pattern in which barriers are erected between regions and departments; encouraging urban and rural economies to help supply each other's needs; and bringing about new productive forces.

--With the coordinated development of the relations between urban and rural areas, it is necessary to establish corresponding organs; give full play to the role of planned regulation, economic legislation, and market mechanism including taxation, credit, and pricing; and remove the barriers so that the cities and towns are integrated with the countryside. It is particularly necessary to take note of giving full play to the role of counties in linking up the relations between urban and rural areas, enhancing power at the county level, and implementing the contracted responsibility system in finance and unified management of manpower and material resources. Meanwhile, it is also necessary to stimulate the initiative of cities and countryside and combine the advantages of both urban and rural areas.

ECONOMIC MANAGEMENT

SOUTHWEST ECONOMIC COORDINATION CONFERENCE OPENS

HK210221 Kunming Yunnan Provincial Service in Mandarin 2200 GMT 20 May 86

[Excerpts] The third session of the Economic Coordination Conference of Sichuan, Yunnan, Guizhou, Guangxi, and Chongqing opened in Kunming on 20 May. There have already been two sessions of this conference, whose establishment was advocated and urged by Comrades Hu Yaobang and Zhao Ziyang. In the past 2 years, under the close concern and guidance of the CPC Central Committee and State Council and the enthusiastic assistance and support of the central departments, this transprovincial open-style economic coordination organization has gained marked economic results. The organization of the conference itself has also undergone new development from form to content, displaying strong vitality and vigor.

Pu Chaozhu, Secretary of the Yunnan Provincial CPC Committee and chairman of the third session of the conference, presided and delivered the opening speech on 20 May. He said: This session is being held at an important moment when the people of the whole country are studying and implementing in the reform spirit the Seventh 5-Year Plan. It is being held amid a new situation in which lateral economic ties are showing extensive growth. The state's Seventh 5-Year Plan explicitly lists the southwest as a national grade-one economic zone. This is a tremendous encouragement for us.

Pu Chaozhu stressed: This session must take as its guiding ideas the basic spirit of the Seventh 5-Year Plan, and the spirit of the speech of Comrade Hu Yaobang at the Nanning conference and the speech of Comrade Zhao Ziyang on persevering in reform and developing lateral economic ties. The session must continue to implement the official written reply of the State Council on the report of the second session of the conference. On the basis of summing up the experiences of the first and second sessions, we should further implement the guideline of reliance on our own efforts, the organization of joint undertakings, state assistance, and common efforts to invigorate the economy, and the principle of voluntariness, equality, and mutual benefit. We should have consultations and discussions on a number of major strategic issues of common concern to the five parties and promote the development of lateral economic ties and cooperation between them.

Comrade Pu Chaozhu announced that in accordance with the application of the Xizang Regional CPC Committee and People's Government, after examination and decision by the delegations, it has been unanimously agreed that the Xizang Autonomous Region should join the Southwest Regional Economic Coordination Conference. We welcome them.

Liao Bokang, chairman of the second session and secretary of the Chongqing City CPC Committee, then delivered a speech reviewing and previewing the conference. Yu Hanqing, deputy secretary of the Chongqing City CPC Committee, gave a summation of work in the 1 year since the second conference. (Bao Yongkang), secretary general of the meeting and secretary general of the Yunnan Provincial People's Government, gave a report on the preparations for the third session.

The opening of the session was attended by Pu Haiqing, leader of the Sichuan delegation and vice governor, and deputy leaders of the delegation; He Zhiqiang, leader of the Yunnan delegation, deputy secretary of the provincial CPC Committee and governor and deputy leader, Vice Governor Chen Liying; Wang Chaowen, leader of the Guizhou delegation, deputy secretary of the provincial CPC Committee and governor, and deputy leaders of the delegation; Wei Chunshu, leader of the Guangxi delegation, deputy secretary of the regional CPC Committee and chairman of the regional government, and deputy leaders of the delegation; Wang Ye, leader of the Chongqing City delegation and vice mayor; (Sha Desheng), a representative of the Xizang Autonomous Region and director of the regional economics office; Wang Qian and Gao Yang, members of the Central Advisory Commission; Ma Hong, chief executive of the State Council's Development Research Center and a well-known economist; and leaders and representatives of 34 central and State Council departments and commissions including the Research Office of the CPC Central Committee Secretariat, the NPC Finance and Economic Commission, the NPC Nationalities Affairs Commission, the Teaching and Research Section of the State Council General Office, and the State Council's Economic, Technological, and Social Development Research Center. Ge Hua, a representative of Hunan Province, also attended by invitation.

SICHUAN, YUNNAN MAKE ECONOMIC, TECHNOLOGICAL PROGRESS

HK211105 Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 20 May 86

[Text] Since the second session of the conference of four provinces and regions and five areas, both Yunnan and Sichuan have made progress in economic and technological cooperation and exchange. The development is both intensive and extensive. The two provinces have been involved in over 600 cooperation projects, the greatest number among the participants in the conference.

The cooperation between Sichuan and Yunnan is diverse and comprehensive. In addition, its rate of success has attracted wide attention. The major item includes joint development of lead and zinc ores and coal, while the general ones include tannery, sugar refining, reeling off raw silk from cocoons, shipping, glass fibre tile, plywood, marble processing, and brewery. Although these items are small in scale, they conform to the conditions of the two provinces. One of the parties can undertake them when the other party needs them. Although the investment sum is small, the projects can bring good economic results and are marked by the characteristics of being short-terms, requiring a small investment sum, and bringing quick results.

The fact that Sichuan and Yunnan started the cooperation activities in forest areas on the western part of the provinces is a further development of the lateral economic ties between the two provinces. While developing the areas and cooperation, the two provinces actively promote cooperation in shipping and technology. The number of technological cooperation projects reached by the two provinces accounts for over 60 percent of the total number of projects. Sichuan is exporting more and more technological items to Yunnan. This benefits the development of Yunnan and brings income to Sichuan, thereby accomplishing the goal of mutual benefit.

Sichuan helped Luliang County in Yunnan establish eight town and township enterprises, which earned over 600,000 yuan in profits last year alone. The (Yongtang) Sugar Refinery at Yongde County, Yunnan, was an enterprise which had suffered losses for 4 consecutive years. After reaching a technological cooperation project on production with Dayi County Sugar Refinery, it signed a 3-year agreement on a production technology joint venture. Therefore, (Yongtang) was able to turn losses into profits. Previously, it had suffered annual losses of 300,000 yuan, but it now earns 400,000 in profits and has gross profits of 700,000 yuan.

In the course of cooperation, both parties also attach importance to carrying forward their own styles as well as the communist spirit of cooperation. The Yuxi Cigarette Factory in Yunnan helped the province's Xichang and Dechang Cigarette Factories solve problems concerning raw materials and techniques for flue-cured tobacco. It also helped them develop new products and improve their product quality.

An enterprise at (Supo) Town in Jinniu District, Chengdu, and an enterprise at (Lubiao) District, Kunming, jointly run a plaster splint factory. According to the agreement, the enterprise at (Supo) Town should have made 320,000 yuan in profits last year, but since (Lubiao) District was affected by a natural disaster during the period, the enterprise voluntarily donated its profits to the district to develop production.

ECONOMIC MANAGEMENT

7 CITIES, PREFECTURES FORM COOPERATION REGION

HK071119 Wuhan HUBEI RIBAO in Chinese 25 Apr 86 p 1

[By reporter on probation Li Mingzhao [2621 2494 3564]: "Seven Cities and Prefectures in Hubei, Henan, Sichuan, and Shaanxi Set Up an Economic and Technological Cooperation Region--Break the Bounds of Administrative Regions and Promote Lateral Economic Combinations"]

[Text] On 21 April, representatives of the seven prefectures and cities in the continguous zone of Hubei, Henan, Sichuan, and Shaanxi Provinces reached an agreement in Xiangfan City to formally set up and more frequent.

The cooperation region will engage mainly in the following:

--Industrial combinations. In the light of their individual strong points, enterprises in each prefecture and city should employ various forms to develop jointly famous-brand, fine-quality, and marketable products; high-technology products; export products that can earn foreign exchange; high-priority agricultural, sideline, and mineral products; and products that can cut down energy consumption and jointly develop coordinated transport and communications.

--Scientific and technological cooperation. Networks of technology development, information exchange, measurement and testing, and personnel exchange will be set up in the whole cooperation region, and priority will be given to the arrangement of the flow of talented people in every prefecture and city within the region.

--Trade combination. The cooperation region will hold an overall material fair once a year, and every specialized department in the region will indefinitely hold various goods-ordering, goods-selecting, and goods-redistribution fairs, and so on. Commercial enterprises in every prefecture and city will work in coordination to carry out activities like holding exhibitions, opening up shops, setting up display windows, developing compensatory trade, and so on, and set up multipurpose or specialized transregional and transprovincial substantial companies.

--Information exchange. Every prefecture and city should encourage every enterprise and department to select one or two relevant units as permanent information exchange points, call information exchange meetings, and exchange information on a regular basis. Every prefecture and city should set up a comprehensive information center, which should be responsible for synthesizing various information of the local departments, hosting information exchange meetings in turn once or twice a year, and compiling information journals, jointly exploiting the materials stored in the scientific and technological libraries of the scientific and technological bureaus in every locality.

HEILONGJIANG SECRETARY INSPECTS GRASSROOTS UNITS

SK150741 Harbin Heilongjiang Provincial Service in Mandarin 2100 GMT 14 May 86

[Text] In his recent investigation tour to the grassroots areas, Sun Weiben, secretary of the provincial CPC Committee, repeatedly put the stress on strictly and earnestly implementing economic policies and carrying out economic contracts and the contracts for purchasing farm and sideline products in order to gain the confidence of the people and to protect the enthusiasm of the staff members, workers, and the peasants. Sun Weiben also called on leading cadres at all levels to show more concern for the reform in the circulation field.

He said: At present, the circulation field has become a link between the urban and rural economic reforms. The urban and rural economic reforms and the production development have set forth many new tasks for the circulation field, and have urgently required us to carry out appropriate circulation reform. Our province has made progress and achievements in this reform, but the current circulation system is not perfect enough due to the fact that the new circulation system has not been set up yet. Owing to serving the state monopoly purchasing and marketing system for a long period of time, some departments have still failed to adapt themselves to the development of commodity economy in terms of their management systems, working personnel's thinking, work methods, and material facilities. If we fail to solve this problem, the urban and rural economic reforms and the production development will be affected.

Sun Weiben pointed out: All localities should pay full attention to maintaining the stability and continuity of the economic policies and to guarding against the practice of making unpredictable changes in the policies. The policies on circulation are directly related to the economic benefits of the masses. The portions of farm and sideline products more or less than the amounts fixed in the purchasing contracts should be handled strictly in accordance with the policies. Such practices as inventing all sorts of names to purchase the above-quota portions by forcing the peasants or not to purchase them should never be allowed. Otherwise, our policies will not stand, we will lose the confidence of the people, and the enthusiasm of the masses will be dampened. It is difficult to revive the people's enthusiasm once it is dampened. We must keep this firmly in mind. Grain and commercial departments and the enterprises should make efforts to master the method of handling affairs according to the economic law; persistently pay attention to the interests of the masses and production; take the whole situation into consideration; and pay attention to social effects.

JIANGXI TO BORROW MONEY TO BOOST CONSTRUCTION

HK211140 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0151 GMT 21 May 86

[Text] Nanchang, 21 May (ZHONGGUO XINWEN SHE)--Jiangxi provincial governor Ni Xiance has said that his province has decided to borrow money for construction so as to build Jiangxi into an important commodity grain base, food base, and a production base for nonferrous metal and building materials for the whole country and for the Shanghai Economic zone.

He said this yesterday at a seminar on the development strategy for the Shanghai economic zone. The seminar was held in Shangrao City, and was attended by some 150 people from various provinces and the municipality of this economic zone.

Ni said: Trying to conduct production and construction without borrowing money is a practice of the self-supporting small-scale peasant economy, and this will prevent us making remarkable achievements.

He said: Last year, Jiangxi Province concluded more than 1,700 cooperation contracts of all kinds and introduced 110 million yuan of external funds. Among other things, 48 joint investment and cooperation projects with foreign companies have been approved by the state authorities, and they brought in $32 million in foreign funds and enabled the province to import equipment and technologies worth $64 million. The imported equipment and funds will enable the province to increase its annual output value by 260 million yuan and increase its tax and profit contributions by 50 million yuan. He said: Practice has shown that using foreign funds and giving part of the equity to foreign companies in construction will not harm our own interest but will just help accelerate our construction in the long run.

Ni Xiance reiterated that Jiangxi's principle for construction is "to emancipate people's minds, open up the door, handle economic relations on the basis of mutual benefit, and give some interests to outside cooperating partners." He said his province will give more preferential treatments to cooperating partners from other provinces or from foreign countries.

Jiangxi Province is located at the meeting point of Central China and Southeast China. The province is rich in mineral resources. Jiangxi has 126 of the world's 160 types of mines, and the reserves of 76 types of mines in Jiangxi have been discovered through geological prospecting. The reserves of 12 types of mines rank first in the country.

BRIEFS

XINJIANG UTILIZING FOREIGN CAPITAL--The region has scored remarkable successes in utilizing foreign capital. As of this moment, the region has 29 contracts with foreigners involving a total foreign investment of over $76 million. Of these, 16 projects have been put into operation. Over the years, the region proceeded from reality and adopted various special and preferential measures for investment and cooperation projects. Through the methods of joint venture, cooperation, compensation trade, export credit and leasing, the region negotiated business with foreign businessmen from 21 countries and regions. Trades utilizing foreign capital include the petro-chemical industry, animal husbandry production, mineral resources development, and processing of non-ferrous metals and non-metal materials, in addition to metallurgy, textile industry, food processing, agricultural production, and the processing of native and animal husbandry products. Most projects that are put into operation bring about good economic results. In 1983, the August First Sugar refinery in Shihezi used loans granted by (Gong Nong) Company to import key equipment such as a beet squeezer. It also used the loans to build a dried beet workshop and used the revenue earned from selling the dried beet to repay the loans within a year. Now this workshop can earn over $1.5 million of foreign exchange a year for the state. [Excerpt] [Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 19 May 86 HK] /12712

HENAN DEVELOPS COOPERATIVE ORGANIZATIONS--Zhenping County has rapidly developed cooperative economy in the rural areas. By the end of April, the county had set up a total of 1,849 cooperative economic organizations with 29,300 participants. The average income per person was 60 percent higher than for ordinary peasants. This county has promoted a variety of rural cooperative economic organizations. There is cooperation based on manpower and technology; cooperation based on contracting to run state-owned and collective enterprises; and temporary and seasonal loose joint undertakings. These cooperative organizations have provided jobs for a large number of surplus laborers and mopped up idle capital in society. They have provided serialized services for commodity production. (Dalongyao) village of (Mazhuang) township set up a plastics processing joint company with seven subordinate specialized branch companies. The company has organized a complete process of production, supply, and sales. Its output value has grown rapidly. The majority of peasant households in (Wangzhao) village of (Chenjiao) township are engaged in fur processing. By organizing cooperation in purchase and sales, the majority of households have increased their income in less than 1 year. Over 100 households now have savings deposits exceeding 3,000 yuan, accounting for one-third of the village's total deposits. GUANGDONG PEOPLE'S CONGRESS HOLDS PLENARY SESSION ON BUDGETS

HK220935 Guangzhou Guangdong Provincial Service in Mandarin 0900 GMT 21 May 86

[Text] In 1985, the province's financial revenue sharply increased and total revenue was greater than expenditure, so that there was a surplus. According to the 1986 draft budget, provincial financial revenue and expenditure will be increased and will be basically balanced.

The above was revealed at the plenary session of the fifth session of the Sixth Provincial People's Congress. The plenary session was presided over by (She Yue), executive chairman of today's session and vice chairman of the provincial People's Congress Standing Committee. Entrusted by the provincial government, He Xian, chairman of the provincial Planning Commission, and (Ling Dengyun), a director of the provincial Financial Department, delivered reports to the deputies on the draft of the 1986 national economic and social development plan, on the draft of the 1985 final accounts, and on the 1986 budget.

In his report, He Xian said: In connection with the arrangements of the draft plan, the province's gross industrial and agricultural output value and GNP value for this year will be 9 percent higher than last year. The national income will be 8.3 percent more than last year.

In his report, (Ling Dengyun) said: Last year the province's financial revenue totalled some 6,927 million yuan, while its expenditure was some 6,674 million yuan. The surplus was some 264 million yuan, thereby successfully accomplishing the 1985 budget. This year, the draft plan's amount of revenue and expenditure is respectively 7.85 and 7.84 percent more than last year. The aim is to strive to balance the accounts.

GUANGXI ISSUES REGULATIONS ON USE, CONTROL OF PREPAID FUNDS

HK211601 Nanning Guangxi Regional Service in Mandarin 1000 GMT 20 May 86

[Text] In order to help the counties and cities receiving financial subsidies to get rid of poverty and become better off as soon as possible, the regional people's government recently issued provisional regulations on the use and control of prepaid working funds of financial subsidies.

The regulations stipulate that those counties and cities which are able to support themselves financially before 1989 may, based on their demand for funds, submit annual expenditure plans to the regional finance department for projects examined and approved by the regional authorities. The regional finance department may, based on the expenditure plans of the relevant counties and cities and the progress of the relevant projects, allocate funds to the counties and cities within the limit of financial subsidies granted to them, until all the funds which should be allocated to the counties and cities in 5 years have been allocated. As for those counties and cities which are unable to support themselves financially before 1995, the people's governments of the counties and cities may apply to the regional finance departments for prepaid working funds of financial subsidies in production and construction projects examined and approved by the regional authorities. The regional finance department may, based on the investment amount in the approved projects and the progress of the projects, allocate funds to the relevant counties and cities within the limit of the financial subsidies granted to them.

The regulations read that the heads of the counties and mayors of the cities of which use prepaid working funds of financial subsidies must, according to the relevant stipulations of the regulations, sign responsibility contracts with the provincial finance department on behalf of the people's governments of the counties and cities. The contracts should clearly define the responsibility, power, and interests of each party and serve as a basis for examination and assessment. In case the contracts are violated and the funds are improperly used, the relevant departments have the right to rectify the mistake, to stop allocating funds, and to recover the allocated funds.

The regulations also make explicit stipulations on specific matters related to the use of prepaid working funds of financial subsidies.

In its circular issuing the regulations, the regional government pointed out that issuing prepaid working funds of financial subsidies to the counties and cities receiving financial subsidies is an important measure to help the counties and cities exploit local natural resources, develop the economy, and support or basically support themselves financially. The people's governments of the counties and cities concerned must seriously study the matter, make unified plans, and implement measures.

FINANCE AND BANKING

SHANXI FINANCIAL OFFICIAL REPORTS ON 1985 ACCOUNTS, 1986 BUDGET

HK211545 Taiyuan Shanxi Provincial Service in Mandarin 2200 GMT 20 May 86

[Text] On 8 May, Yan Yuansuo, director of the provincial Finance Department, delivered a report to the fourth session of the sixth provincial People's Congress on the province's final accounts for 1985 and budget for 1986. The report was divided into three parts:

1. The province's final accounts for 1985: The province's revenue for 1985 was some 4.39 billion yuan, and its expenditure was 3.55 billion yuan. The province's revenue and expenditure for 1985 was balanced with a slight surplus.

2. The province's budget for 1986: The year 1986 is the first year of the Seventh 5-Year Plan. Making a good budget for this year is of great significance. The principle for making this year's budget is that we must bring into play the functional role of finance departments, continue to maintain a steady growth in the province's revenue on the basis of promoting production and improving economic results; further reform and perfect the finance and taxation system in accordance with the requirements of consolidation, digestion, supplement, and improvement; serve economic structural reform and other reforms even better; promote technological exploitation and advancement; further develop education, science, and public health; reasonably increase agricultural investment; enliven the rural economy; continue to improve the living standard of urban and rural residents; do our utmost to improve finance and taxation management; enforce financial and economic discipline; oppose extravagance and waste; and ensure the fulfillment of the task for the province's revenue and expenditure.

3. Fight for the fulfillment of the province's budget for 1986. The report put forth the following measures: 1) We must continue to put reform above all and vigorously promote lateral economic ties. 2) We must strengthen business management, improve economic accounting work, and do still better in turning losses into profits and in technological transformation. 3) We must reasonably distribute funds and strictly control and reduce expenditures. 4) We must further strengthen taxation management and do our best to increase financial revenues. 5) We must strengthen financial supervision and continue to grasp taxation and financial examination, so as to ensure the smooth progress of the reform and the healthy development of the national economy.

MINERAL RESOURCES

DISCOVERY OF LARGE GOLD MINE IN GUANGDONG REPORTED

Hong Kong WENHUI BAO in Chinese 18 Mar 86 p 3

[Text] An important breakthrough has been made in Guangdong's gold prospecting. Within the Hetai Mining Area of 40 sq m in Gaoyao County, Zhaoqing Prefecture, in western Guangdong, a large gold deposit has been verified and 57 mineral veins of gold have been discovered. Seventeen of these veins are of industrial value.

An official of Guangdong Provincial Geological and Mining Department said that the large gold mine in Hetaigaocun, already verified, is over 1 km in length, and the gold content of the ores is one- to twofold higher than the grade required for industrial exploitation. Besides, it can be easily extracted. This deposit is now ready to be designed for exploitation and will be put into operation in the near future. Furthermore, in an area of more than 1,300 sq km at the fringe of the Hetai Mining Area, many gold anomalies have been discovered with geochemical methods, including 29 1:10,000 geochemical anomalies and 22 1:50,000 stream sediment anomalies, all showing promising mining prospects.

According to some person in the geological department of Guangdong, the mineral veins of the Hetai gold mine belong to an altered rock deposit of a typical crushed zone similar to the Jiaojia gold mine deposit in Shandong. This discovery is of great significance to further large-scale gold prospecting in Guangdong.

As we understand, nearly 20 gold deposits and 1,000 gold points have been verified in Guangdong, and more than 380 such mines are located in western Guangdong.

MINERAL RESOURCES

BRIEFS

HEILONGJIANG'S GOLD MINES--According to a recent statement of Heilongjiang's Governor Hou Jie [0186 2212], foreign traders are welcomed in the province for joint ventures in gold mining. He said: Heilongjiang's gold deposits rank second in the country and planning is now underway for two mines to be exploited by joint ventures with foreign traders. One of them is the Fukeshan Placer Gold Mine located in Gulian Township, Mohe County which is accessible by highway. The volume of placer gold deposits is 16,500 cubic meters and the average grade is 0.299993 gram/cubic meter, mostly in the form of long frozen ores. This will be a new mine to be exploited for 12 years with foreign cooperation. The other is the Laogou Placer Mine of Mohe, located in Xiaojingou Township of Mohe County. The mine site is 45 km north of Xilinji Railway Station and 40 km south of Mohe Town, also accessible by highways. The mine has a 100-sheng gold-mining boat and the new productive capacity is planned to be 6,500 liang a year. According to Governor Hou Jie, any foreign trader interested in these two projects can directly contact the Heilongjiang Gold Company of the Ministry of Metallurgical Industry. [By Li Zhou [2621 1558] [Text] [Chengde JINGJI XIAOXI in Chinese 25 Feb 86 p 2] 9411

DEVELOPMENT OF NONMETALLIC MINERALS--According to a recent statement of General Manager Zong Benmu [1350 2609 2606] of China Nonmetallic Mineral Industry Corporation, China will take full advantage of its superior nonmetallic mineral resources and promote its national economic development by exploiting and exporting its marble, granite, barite, graphite and other mineral products. He said: China will establish three export bases for talc products in Liaoning, Shandong and Guangxi; three export bases for graphite products in Shandong, Heilongjiang and Nei Monggol; and a number of developing and processing bases for granite and marble in Shandong, Shanxi, Sichuan, Fujian, Guangdong and Henan. To accelerate the development of its nonmetallic mineral industry, China will invest 530 million yuan in capital construction for this industry and for the technical transformation of the existing enterprises. Besides making its own investment, it will also adopt preferential policies similar to those used in the SEZ' to attract foreign funds for the development of its nonmetallic resources and to encourage foreign traders to open their own enterprises, to form joint ventures, or to undertake cooperative production, compensatory trade and so forth in China. It will also import advanced technologies and some key equipment for mining and processing mineral products. [Text] [Chengde JINGJI XIAOXI in Chinese 28 Feb 86 p 2] 9411

PROVINCIAL BUILDING MATERIALS INDUSTRY DISCUSSED

Development in Hebei

Beijing ZHONGGUO JIANCAI [CHINA BUILDING MATERIALS] in Chinese No 3, 13 Mar 86 pp 32-33

[Article by Cao Tianping [2580 3944 1627] and Xu Bingzhan [1776 4426 0594] of Hebei Provincial Building Materials Bureau: "Hebei's Rapidly Developing Building Materials Industry"]

[Text] Hebei's building materials industry is not only a great asset to the province, but also an important industry in China. Its special features are as follows:

Rich Resources, Long History

Hebei has very rich building materials and nonmetallic mineral resources. Their verified deposits in 1984 were as follows: cement limestone, 1,144,699,000 tons; hyaline quartz, 50,000,000 tons; asbestos, 420,000 tons; marble, 50,000,000 cubic meters; gypsum, 694,099,000 tons; porcelain clay, 8,660,000 tons; zeolite, 86,230,000 tons; and natural oilstone, 1,150,000 tons. In addition, there are deposits of pearlite, basalt, roselite, graphite, mica and kaolin of certain amounts. There is great potential for the discovery of new minerals and the expansion of prospective reserves.

Hebei has not only abundant building materials resources, but also a long history of their production. The first modern industrial enterprises to produce plate glass and sanitary ceramic wares, namely, the present Yaohua Glass Plant of Qinhuangdao (built in 1922 and completed in 1924) and the Tangshan Ceramic Plant (built in 1914), are both in Hebei. The Laiyuan Asbestos Mine in Heibei also has a history of more than 60 years. These enterprises not only have a long history, but also are large with a solid technical foundation. They have made great contributions in training and supplying technical personnel for national construction.

Developed Production, Advanced Technology

Hebei's building materials industry has undergone great development since the founding of New China. In 1984, the annual cement output reached 7,770,000 tons, 6.5 percent of the national total. The monthly output now is six to seven times that of the period shortly after the founding of the People's Republic. Plate glass output has reached 6,780,000 cases, a 16-fold increase and one-eighth of the national total. The output of sanitary ceramic wares has reached 2,840,000 pieces, more than 600 times that of the early post-liberation period and amounting to 50 percent of the national total. The total output value of building materials in the province has reached 1.7 billion yuan, an increase of more than fortyfold. There are 2,753 building materials enterprises of 11 branches engaged in the production of cement and cement products, glass and glass fiber, sanitary wares, bricks and tiles, ash, sands, stones, asbestos products, cast stones, construction machinery, and other new building materials, and in the extraction and selection of nonmetallic minerals. These enterprises produce more than 150 varieties of products and have formed a multi-branch, multi-variety and multi-level building materials production system.

Great progress has been made in the industry's technology. In 1969, a [liboer] kiln was imported from East Germany and the Handan Cement Plant was built with a productive capacity of 1,200,000 tons. In 1980, a production line with the use of a rotary kiln and a precalcinator of the 1970's vintage was imported from Japan, and China's first large, modern Qidong Cement Plant was built. In December 1984, only slightly more than 2 years later, this plant was put into operation with a designed capacity of 1,290,000 tons of portland cement a year. The Yaohua Glass Plant of Qinhuangdao has continued to improve its production technology after several large-scale technical transformations, and its production is now basically mechanized. In 1983, it set up three Fourcault process production lines with an annual productive capacity of 1.5 million cases. In 1985, again, it built a float process production line with an annual productive capacity of 2.5 million cases. The Tangshan Ceramic Plant and the Tangshan Building Ceramic Plant have totally discontinued the use of downdraft kilns of the 1930's and replaced them with tunnel kilns. For the forming of sanitary wares, pipes are used for vacuum slip casting and drain casting. For the forming of glazed bricks, the technology of spray drying and the automatic press imported from the FRG are now used for continuous production. Successful experiments have also been made in the new technology of quick firing at low temperature for wollastonite. These experiments have paved the way for further advancement in the technologies of production.

Three Highly Competitive Products of Building Materials Bases

The resources of Hebei's building materials are mainly concentrated in Tangshan and Qinhuangdao which have become the bases of cement, plate glass and sanitary wares in the province. In Tangshan, the productive capacity of cement is more than 3 million tons, one-third of the provincial output. The output of sanitary wares accounts for 51 percent of the provincial total and more than 80 percent of the national exports. In Qinhuangdao, the productive capacity of the glass industry already reached 6 million cases in 1984 and may rise to 10 million cases in 1986. It will then be China's largest glass base.

Hebei has not only high output, but also top quality for its cement, plate glass and sanitary wares. These products are well known at home and abroad as the "three highly competitive products" of Hebei. The Shengli-brand ceramic sanitary wares of Tangshan Ceramic Plant won a state silver medal in 1980, while the Sanwan-brand enamelled bricks of the Tangshan Municipal Building Sanitary Wares Plant and the Shengli-brand 22-inch ceramic sinks won silver medals in 1982. The "Horse-brand" portland cement made from lava and produced by Tangshan's Qixin Cement Plant won gold medals in many grand exhibitions held at home and abroad and, after 1981, again won national silver medals. The plate glass of Qinhuangdao's Yaohua Glass Plant occupied the top rank in the country for 7 consecutive years after 1978, and its specially chosen glass produced with the double-roller method, won a national silver medal in 1984. Up to that year, 5 products of Hebei's building materials industry won national silver medals, another 5 won the title of fine-quality products from the ministry and 15 won the same title from the province.

Future Economic Development

Despite its remarkable development, the quantity, quality and varieties of products in Hebei's building materials industry is still far from adequate for the modernization program. The provincial party committee and the provincial government have attached great importance to the development of this industry and have listed this as a priority item in their present planning as well as their future development strategy. To accelerate its development and to fully exploit its superior resources, everyone on the building materials front of the province is now earnestly implementing the principle of developing the building materials industry on a mass basis and arousing the enthusiasm in various quarters for the development at various levels and in various locations, various economic forms and various modes of business operation. They are also further promoting the technical advancement and transformation for the existing enterprises, attending to the construction and the advance work of the key projects, and laying a foundation for the future takeoff of the building materials industry in the province.

Our objective is to develop Hebei's building materials industry into a "pillar" industry of great vitality and to turn the provincial base of this industry into a national base. With the improvement of economic results as a prerequisite, we will strive to quadruple the total output of building materials ahead of schedule.

Development in Shandong

Beijing ZHONGGUO JIANCAI [CHINA BUILDING MATERIALS] in Chinese No 1, 13 Jan 86 pp 28-29

[Article by Sun Danhua [1327 0030 5478], secretary of Shandong Provincial Building Materials Bureau Party Committee, and Li Huaizhen [2621 2037 6297], Director of Shandong Provincial Building Materials Bureau: "Shandong's Developing Building Materials Industry"]

[Text] Shandong's building materials industry is now developing briskly. At the end of 1984, there were already 4,286 building materials enterprises in the province, including 359 above the county level and with an total output value of 1.7 billion yuan. The province produces 118 different products. The output of marble, granite, diamond, and graphite ranks first in the country, while that of talc, cement and plate glass ranks second, third, and fourth respectively. It has become an important producing area for the building materials industry in China.

How did this industry develop in Shandong?

Development by Relying on Mass Effort

Shandong's building materials industry was developed by relying on the enthusiastic support of the localities and departments and through the use of local material and financial resources.

With regard to the sources of funds, only 20 percent the fixed assets, 1 billion yuan in value, of some 300 building materials enterprises above the county level in the province came from the state budget and from the province's investment in the "five small" industries, while the funds for the remaining 80 percent were raised by the localities and the enterprises themselves.

As for the composition of enterprises, only 309, 7 percent, of the 4,286 building materials plants and mines belong to the building materials system, while the remaining 93 percent were built by the metallurgy, coal, chemical, and power industries and by the township and town industry departments.

As for the industrial output value, the enterprises within the system contributed only 626 million yuan, 35.8 percent of the provincial total of 1.7 billion yuan in 1984, while the remaining portion of nearly two-thirds was created through the collective efforts of various trades and undertakings.

Now let us look at the output of various products. In 1984, the total cement output of the province was 9.23 million tons, of which, 58 percent belonged to the building materials system; that of plate glass was 2.44 million cases, of which, only 10.2 percent belonged to the system; and 28.3 billion bricks, of which, only 4 percent belonged to the system. Thus more than half of the output was created by the localities and the different departments.

Practice has proved the effectiveness and correctness of the principle of advocating and supporting the reliance on mass efforts as a means of accelerating the development of the building materials industry.

Transforming and Tapping the Potential of Old Plants

Since the 3d Plenum of the 11th CPC Central Committee, the building materials departments in various parts of Shandong have concentrated their efforts in transforming and tapping the potential of the old plants for their intensive growth. Priority was given to the technical transformation of the cement and glass plants.

From 1979 to 1984, 96 indigenous and ordinary vertical kilns of the 125 local cement plants were converted into mechanized vertical kilns. At the same time, more than 100 sets of small old-style ball mills of poor economic results were replaced by large and highly-efficient ones, and more than 200 sets of machinery in support of the mechanized production lines were renovated, thus enabling the cement industry to develop its production through technical advancement. In 5 years, the local annual output of cement in the province was increased from 4.08 million tons to 7.99 million tons, the proportion of up-to-standard cement was raised from 83 percent to 98.5 percent, the consumption of standard coal for each ton of clinker was reduced from 155 kg to 143.17 kg, and the total profits increased 1.3-fold.

In the production of plate glass, two key plants had their three-machine kilns converted into six-machine kilns, and their two-machine kilns converted into four-machine kilns. Five small plants were transformed and their annual output increased from 700,000 cases to 2,440,000 cases.

The nonmetallic minerals and other local building materials also underwent new development with improved quality through transformation and potential tapping.

In these 5 years, 6 different products won national silver medals for their fine quality, 26 products were rated by the ministry and 38 others by the province as fine-quality products.

Superior Resources Turned Into Economic Assets

Shandong has rich resources of building materials and nonmetallic minerals. Since the founding of the People's Republic, the province has discovered through excavation 45 types of minerals in nearly 1,000 mineral points.

"Develop products, increase supplies" is the motto inspiring the localities in Shandong to develop the building materials industry. From 1979 to 1984, the number of building materials varieties increased from 65 to 118, the number exported increased from 14 to 20, and the foreign exchange thus earned increased from $8.86 million to $26.25 million.

In a further step to turn these superior resources into economic assets, the building materials industry department of Shandong has the following five plans for the nonmetallic mineral products during the Seventh 5-Year Plan period:

First, a fairly large increase in the varieties to be developed. In addition to graphite, talc, gypsum, feldspar, mica, asbestos, marble and granite, such new products as hyaline quartz, bentonite, fluorspar and barite will also be developed.

Second, the establishment of production bases for key products. With the Nanye Graphite Mine as the center, a graphite production base will be established; and with the marble mine in Yexian County as the foundation, Qingdao, Jinan, Pingdu and Xixia will be jointly organized into a production base for marble, granite and slate.

Third, a fairly significant readjustment in the product mix. There will be a shift from the production of mainly raw materials to intensive processing.

The quality of the major products will be up to, or approach the advanced international standards. In 1990, the output value of processed nonmetallic minerals should amount to more than two-thirds of the total output value of nonmetallic minerals.

Fourth, a fairly large increase in export products. The number of varieties of products for export will be increased from 20 at present to 35 in 1990, and the foreign exchange earnings from this source will be increased from $26 million to $40 million.

Fifth, a marked improvement in economic results. In 1990, the total output value of nonmetallic minerals and their manufactured products in the province will be increased from the present 130 million yuan to more than 300 million yuan, and the taxes and profits for the state should be increased from 25 million yuan to 60 million yuan.

Development Accelerated During Reform

In the past several years, the building materials departments in various localities of Shandong have actively carried out the reform in the decentralization of authority and the adoption of flexible policies, and thereby accelerated the development of the building materials industry.

First, the structural reform and the extensive lateral economic and technical cooperation. The municipal building materials department of Yantai has signed agreements with the relevant units in the country on 53 projects of economic and technical cooperation and brought in 17 items of scientific research achievements, which have prepared the way for increased exports.

Second, decentralization of authority and adoption of flexible policies to support the building materials enterprises. While delegating more authority to the enterprises under its jurisdiction, the provincial building materials bureau has also relaxed its control over production planning and price control. The number of products originally planned by the province is now reduced from 37 to 27. With the exception of cement and plate glass which are subject to mandatory plans, and the cement equipment, asbestos products and diamond which belong to the state, all the rest are subject to guidance plans. Formerly, the provincial bureau controlled the prices of 12 products; now it controls those of only 5 in 20 enterprises. The prices of other products in other enterprises are now decided by the prefectural and municipal building materials departments in consultation with the price administration bureaus.

Third, opening to the outside world and importing foreign funds and technology. The building materials departments in various localities have established economic and trade contacts with more than 50 countries and regions, made use of $6.43 million of foreign funds, and imported 7 advanced technologies as a preparation for the developing production and increasing exports. From 1978 to 1984, the average increase in foreign exchange earnings through exports was more than 20 percent each year.

Fourth, establishment of an extensive supply network to enliven the business. More than 1,300 outlets have been set up in various localities within the building materials supply network. Many localities are now able to supply complete sets of components for farm houses besides retailing cement, glass and other civilian building materials and providing technical services for the convenience of the peasants in building houses.

The reform and adoption of flexible policies have helped accelerate the development of Shandong's building materials industry. At the end of 1984, the province fulfilled the Sixth 5-Year Plan for the total output value of building materials 1 year ahead of schedule and fulfilled the total profit targets 2 years ahead of schedule. These are positive contributions to Shandong's economic development.

BRIEFS

PRC WORLD'S LARGEST CEMENT PRODUCER--According to the National Conference of Building Materials Trade and reported by XINXI RIBAO, China's cement output reached 142,450,000 tons last year, a 15.8 percent increase over the previous year, and 80 percent of this amount, was produced by the departments and the township and town enterprises. China's cement output now tops the world. In the future, the efforts of its cement industry will be concentrated on the production of more fine-quality cement. SMALL-SCALE ENTERPRISES

TOWNSHIP INDUSTRY BECKONS FOREIGN INVESTORS

Hong Kong CHINGCHI YU FALU [ECONOMY AND LAW] in Chinese Vol 5, Feb 86 p 10-11

[Article by Chen Qingzhong [7115 1987 1813]: "Bright Prospects in Township Industry Investment"]

[Text] The Chinese government has consistently encouraged the development of small towns and township industry. Particularly after the 3d Plenum of the 11th CPC Central Committee, as agriculture and the entire national economy made big strides forward and the open door policy and economic invigoration went under way, township industry throughout the nation has been bubbling with life. Coastal provinces like Jiangsu, Zhejiang, Guangdong and Shandong, for instance, have flourished, along with the outskirts of various large and medium-sized cities. In just a few short years township industry, with its spectacular achievements, has become an important component of the national economy. Statistically, its total output value nationwide reached 49 billion yuan in 1984, up 51.7 percent over 1981, overtaking the 35.1 percent growth rate chalked up by industry during the same period. In the first half of 1985, its total output value again shot up 50 percent over the comparable period in 1984. To illustrate, let us look at the situation in a number of municipalities and counties.

As of late 1984, there was a total of 9,482 township and town enterprises of all types in Kunming, Yunnan, employing 137,400 workers, or 12.64 percent of the entire labor force in the countryside. Their gross earnings amounted to 445.71 million yuan, up 46.64 percent over 1983, or 5.6-fold over 1978, which translates into an average annual growth rate of 37 percent, higher than that of agricultural and industrial output in the municipality.

In 1984, both the output value and profits of township and town enterprises in Ba County in Hebei Province doubled that a year ago. In the first 7 months in 1985, their output value topped 250 million yuan and profits reached 80 million yuan, an increase of more than 100 percent over the corresponding period a year ago.

In Shazhou County in Jiangsu, township and town enterprises paid as much as 67.95 million yuan in taxes in 1984 alone. From January through April 1985, their tax payments exceeded 52 million yuan, 22 million yuan more than the same period in 1984. It is projected that tax payments will amount to about

160 million yuan for 1985 as a whole, roughly a 10-fold jump over 1979, and 99 million yuan more than in 1984.

The Functions Of Township Industry

Facts prove that the development of township industry has contributed immensely to the boom in rural and urban markets and the improvement of living standards. It has also done much to support agriculture and national construction. Hence its rising economic and strategic significance and the growing attention it is attracting from more and more countries and regions around the world. According to statistics from relevant departments, one foreign investor entered into project negotiations with township industry every day during the first half of 1985. By late March, 302 township and town enterprises across China had signed joint or cooperative venture agreements with foreign businessmen. In Beijing, for instance, 31 such deals were made in 1984, joined by 44 more in just the first quarter of 1985. China's township industry is a vast field; under the guidance of the open door policy, investing in township industry will pay handsome dividends.

The Characteristics Of Township Industry

Township industry, which essentially comprises small-scale enterprises, is related to agriculture in numerous intricate ways and can be described as agriculture's new-born baby. In capital, labor, sites, land, raw materials, even labor time, township industry is intimately linked to agricultural production. With its vast domestic market, abundant natural resources and ample, inexpensive labor, it is a low-cost, high-profit operation. In township industry, operational methods are flexible, investments are modest, profits are readily made and one can shift from one line of business to another promptly. It is, indeed, an ideal investment environment highly suited to the foreign businessman. General Manager Jiang Tianbao [3068 3240 1405] of Changsheng Enterprise Ltd of Hong Kong invested HK$1.8 million in a joint venture with Hainandao, the Nanbao Imported Auto Repair and Outfitting Company, and serves as the project's Hong Kong manager. Over the past year, he opened branches in Haikou,   County, Qionghai and Wenchang, recouped all his initial fixed assets investments in the joint venture and even came up with a small profit.

Problems In Township Industry

China's township industry is currently going full steam ahead. While it has certainly come under pressure as the government seeks to restructure the urban economic system and intensify macroeconomic control and management, it has derived fresh impetus from the same developments to meet the demands of the planned commodity economy, enhance its ability and accumulate experience in the law of value so that it can bring prosperity to the rural economy and help realize rural-urban cooperation. Many township and town enterprises have also taken it upon themselves to export to earn foreign exchange. However, even as it continues to make headway, China's township industry is fraught with problems and difficulties that call for urgent solution. Among the major problems are:

1. Fund shortages. Fund shortages and cash flow problems are a widespread concern in township industry. Take Kunming, for instance. A study in 1985 found that township industry in the city needed over 200 million yuan in loans but obtained only 110 million yuan, 100 million short of their total credit requirements. As a result, a number of feasible projects and enterprises on the drawing board have been shelved.

2. Raw material shortages. The spirit of CPC Central Committee documents requires goods and materials agencies concerned from the central to the provincial and municipal levels to incorporate into their plans the raw material and fuel needs of township and town enterprises for manufacturing their major products, especially foreign exchange-earning exports. Many localities, however, have yet to come up with planned supply quotas for it. Surveys show that township industry depends on command planning for less than 10 percent of its raw materials and relies mainly on market regulation, which is a costly thing to do as it jacks up costs, to the detriment of its economic efficiency. Because of over-building, raw materials shortages and soaring market prices, a number of small-scale chemical fiber factories and textile plants have been operating under capacity.

3. A shortage of technology and skilled personnel. Outdated equipment, inaccessibility to information, low operational and managerial standards and poor industrial health management. Township industry desperately needs applied scientific and technological achievements. In early July 1985, Guangdong put together a trade fair in applied technology, featuring over 2,000 technical research achievements. As of 15 July, 179 contracts and letters of intent with a combined value of 53.29 million yuan had been signed. The vast majority of the buyers were township and town enterprises in prefectures and counties in Guangdong. Township enterprises are mostly equipped with obsolete machinery and lack technical personnel. Take Nangong County in Hebei, for instance. Beihuxiang Flour Mill paid 30,000 yuan for some equipment retired by a foreign factory, which, however, turned out to be antiquated and did not complement other hardware in the mill well. After the plant somehow managed to knock together the pieces and put them into operation, the output came to less than half the designed capacity. Its flour was so shoddy that the mill could not compete from the very beginning. Chuiyang Township spent 110,000 yuan on a set of advanced shoe-making equipment. Yet none of the seven "technicians" it successively hired from outside at a high salary has mastered the entire spectrum of shoe technology and are particularly inadequate when it comes to design. The enterprise failed 4 months after it went into business.

4. Excessive energy consumption. In 1983, township industry nationwide consumed as much as 60 million tons of energy. From 1980 through 1983, energy consumption by this sector grew 13.5 percent annually on the average, much of it accounted for by fuel inefficiency. For the nation as a whole, average energy consumption per 10,000 yuan in industrial output was 6.7 tons of standard coal. The corresponding figure for township industry is 7.5 tons, or 8.6 tons if we include noncommercial energy consumption. A major factor for excessive energy consumption is the over-development of building-materials and metallurgical enterprises, which are high energy users: In 1983, the building

materials industry accounted for 21 percent of the gross output value of township industry but 46 percent of its energy consumption. Metallurgical enterprises within township industry consume 2.4-fold more energy than the national average for every 10,000 yuan worth of output. The upshot is energy shortages in the countryside, which will inevitably hold back the growth of township industry, at the same time exacerbating the energy supply problem in rural areas.

All kinds of foreign investors can do much to help resolve these problems in township industry, for example, by going into joint ventures or contracting with local concerns to process imported materials, and through energy development, the introduction of advanced technology and equipment, technical innovation, equipment modernization, the development of new products, the upgrading of product quality and the improvement of operations, management and industrial health control, etc. China should offer foreign businessmen preferential treatment in accordance with the state's central policies, particularly those who provide township and town enterprises with advanced, practical, small-scale, specialized, modern and effective technology that will pay off quickly and substantially improve social and economic efficiency.

What Foreign Investors Should Beware Of When They Invest In Township Industry

Needless to say, when a foreign businessman invests in township industry, he must understand its intrinsic characteristics and not deviate from the overall demands of China's macroeconomy. As far as the characteristics of township industry are concerned, it is both commercial in nature and closely related to agriculture, which explains why township industry does not fit into the same mold as urban industry. It cannot be too large and should not duplicate the products of urban industry. Nor can it afford to ignore regional differences and the disparate conditions under which each operates. In other words, township industry must focus on local resources and local markets and should primarily satisfy local consumption and serve the development of agriculture and sideline production. When it is fairly well-established, of course, township industry should not hamper its own growth by confining itself to local materials, local processing and local sales. Township industry should take pains to turn out products others have ignored and supplement the larger sectors of the economy by coordinating and engaging in specialized cooperation with large-scale urban enterprises. Its winners should be a wide variety of specialized, high-quality, novel and inexpensive items produced in limited quantities. Township industry certainly includes enterprises that export their products in return for foreign exchange. According to survey data, some township and town enterprises have already geared their output toward the international market. For instance, universal couplings made by the Hangzhou Universal Coupling Company are selling briskly both at home and abroad and have garnered a domestic and international reputation, particularly in the US noted for its highly advanced auto industry. Another example is the Huamei Trademark and Decoration Company, founded with foreign imports by Yufushangying Xincun in Tong County, Beijing. Not only does it prepare trademarks and do printing jobs for firms in foreign trade but it will also undertake trademark and decorating projects for foreign businessmen extensively.

As far as the general demands of the national macroeconomy are concerned, the products of township industry by and large are not included in the command plan of the state. Nevertheless, township industry too should be amenable to the guidance of national planning, instead of reacting only to price-related information. It must not rush headlong unthinkingly into whatever is most profitable or stampede to produce a particularly hot item. Nor should it go in for all kinds of machine-manufacturing the moment "industry" is mentioned. "Industry" includes the local processing, transformation and comprehensive utilization of agricultural products (including agriculture, forestry, animal husbandry and fishery); services provided to farming and aquaculture before and after production, that is, the promotion of commodity circulation and infrastructural construction; the development of the building-materials industry, construction and other township industries that directly serve the countryside; and small hydropower stations, small coal pits, small thermal stations and small mines. Certainly an investment must be preceded by thorough research and feasibility studies to avoid imitation, shortsighted and mechanical duplication and unnecessary import. In importing advanced and appropriate technology, moreover, an investor should make it a point to train a host of production personnel to be technically competent and equip them with the skills to use and repair machinery. The initial stage of technology import should be integrated with the later stages of absorption, assimilation and innovation. Foreign investors should be farsighted and cooperate with China on a long-term basis to help the latter raise product quality and export to earn foreign exchange.

How To Solve The Problems Of Foreign Exchange Balance

Of utmost concern to foreign businessmen when they invest in the interior is the question of foreign exchange balance. On this issue, the Hong Kong and Macao Department of the Bank of China has made a number of suggestions. In its opinion, the best thing to do is to make full use of human and material resources on the mainland to produce goods at lower cost than in Hong Kong, Europe or the US, and sell them on the world market via the overseas marketing network, thereby earning foreign exchange. Of the 32 Chinese-foreign joint and cooperative ventures already in business in Tianjin, for instance, all had achieved a foreign exchange balance or surplus by mid-July 1985, and both Chinese and foreign partners have made a profit. Among them are 14 industrial enterprises whose foreign investors, including Remy Martin Ltd of France, Weima Company of the Federal Republic of Germany, and Da Zhong Pharmaceutical Company of Japan, have good credit standing and adopt the latest technology. These joint ventures have benefited from foreign capital and advanced technology. Their foreign partners' established sales and marketing networks, moreover, provide the products with reliable sales channels abroad. In addition, the enterprises researched the market meticulously beforehand, targeted products capable of prying open the international market fairly rapidly and have built up a good reputation. We believe that this approach is entirely feasible. As long as he runs his business properly and turns out internationally competitive products, the foreign businessman who invests in China can balance his foreign exchange and even achieve a surplus.

TRANSPORTATION

RAILROAD CONSTRUCTION DURING 6TH 5-YEAR PLAN DESCRIBED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 2, 28 Mar 86 pp 2-3

[Article by Ministry of Railways Planning and Statistics Bureau Office: "Tremendous Achievements in Railway Building During the Sixth 5-year Plan"]

[Text] The 12th party Central Committee set the strategic goal of quadrupling the gross industrial and agricultural output value by the end of the present century, and railway construction is one of the strategic keys to the realization of this magnificent objective. During the Sixth 5-year Plan period, under the correct leadership of the CPC Central Committee and the State Council, 3 million railway staff members and workers carried forward the glorious tradition of arduous struggle in transportation, capital construction and industrial production to score encouraging achievements. In 1985, the volume of freight hauled amounted to 1.27 billion tons, up 17 percent from 1980. Passenger transportation reached 1.11 billion, up 21.6 percent from 1980. Passengers and freight converted into turnover volume terms reached 1,029,100,000,000 ton km breaking the 1 quadrillion mark for the first time in a 45.2 percent increase over 1980. Railroad transportation played an important role in satisfying needs for industrial and agricultural production and for the daily lives of the people.

As a result of diligent implementation during the Sixth 5-year Plan of policies of readjustment, restructuring, consolidation and improvement and of "careful calculation, and strict budgeting and economizing on investment," railroad construction embarked on a course of sustained and steady development. Comparison of 1985 with 1980 shows an increase in railroad operating distance from 49,940 km to nearly 52,000 km; an increase in the multiple tracked distance from 8,118 km to nearly 10,000 km; an increase in the electrified railroad distance from 1,667 to 4,000 km, and an increase in the distance over which diesel engines operate from 7,401 km to 10,000 km.

Focus on Intensified Construction of Four Main Routes

During the Sixth 5-year Plan, the railroads concentrated financial and material resources on improving the capacity of four main routes (routes for hauling coal out of Shanxi Province, north-south routes, routes between major regions and routes to areas behind coastal ports), placing emphasis on greater improvement of existing lines and the building of needed new lines. Work done on these four routes was as follows:

Construction of routes to haul coal out of Shanxi Province was the "key of all keys" project in railroad construction during the Sixth 5-year Plan. Shanxi is a major coal producing base for the country, providing coal to 25 provinces, municipalities and autonomous regions throughout the country as well as for export. Routes for hauling coal out of Shanxi Province (including the northern route, the central route and the southern route) became key projects during the Sixth 5-year Plan. On the northern route, projects completed were the major electrification of the section between Fengtai and Shacheng on the Beijing-Baotou line; the building of a new double tracked electrified line between Beijing and Qinhuangdao, and technical improvements to the Beijing-Taiyuan line. Construction work is currently being done at a rapid pace on the Dalian-Qinhuangdao line. On the central route, electrification of the Shijiusuo-Taiyuan line, doubletracking of the Shijiusuo-Dezhou line and doubletracking of the Jinan-Lancun line was completed. On the southern route, parts of the Taiyuan-Jiaozuo and the Xinxiang-Jiaozuo lines were doubletracked. Parts of the Nantongpu line were doubletracked and track was laid and traffic opened on the Handan-Changzhi line, the Yanzhou-Shijiusuo and the Xin-He line. As a result of improvements and expansions, capacity for hauling coal out of Shanxi today has greatly increased. State plans calling for an increase in coal hauling capacity from Shanxi from the 72 million tons of 1980 to 120 million tons in 1985 have been already achieved. In 1985, 126 million tons of coal were hauled from Shanxi in a 66.3 percent increase over 1980 for an average 10.4 percent annual increase.

2. A complete overhaul of north-south routes was carried out. The Beijing-Guangzhou line is an extremely busy trunkline running north and south. The section between Hengyang and Guangzhou was a single track with low hauling capacity that caused a bottleneck for the whole line. Consequently, doubletracking of the Hengyang-Guangzhou section became one of the key projects during the Sixth 5-year Plan. Doubletracking of the Hengyang-Guangzhou line extends for a distance of 542 km, 54 km of which has already been opened to traffic for an amelioration of the transportation shortage at the southern end of the Beijing-Guangzhou line. On the down line from Pingshikou, the amount of freight accepted for transportation has risen from the 11.38 million tons of 1980 to 15 million tons in 1985. In addition, the coming on stream one after another of the Zhicheng-Liuzhou line and the Anhui-Jiangxi line to divide the flow has reduced transportation pressures on the Tianjin-Pukou line and on part of the Beijing-Guangzhou line.

3. Construction of routes between major areas has been intensified. Improvements on southwestern routes have been accelerated. The Ankang-Chongqing line is an important route connecting southwestern China with the outside world, and once the section between Xiangfan and Daxian had been electrified, transportation capacity increased. Transportation has always been hectic on the Chengdu-Chongqing line, but once the whole line had been electrified, its capacity more than doubled and the transportation shortage moderated. Electrification and entry into service of the Guiyang-Kunming line (from Guiyang to western Shuicheng) was of major significance in expanding output of coal and phosphate in Yunnan and Guizhou. Electrification of the Hunan-Guizhou and Sichuan-Guizhou lines is underway.

Routes leading from northwestern China were further improved. The Longhai Line is a major east-west trunkline in China that is very busy. Completion of electrification of the Baoji-Lanzhou section of this line during the Sixth 5-year Plan substantially ameliorated the shortage of capacity through the Tianshui Pass. During the Sixth 5-year Plan, the Qinghai-Xizang line (Xining-Golmud section), the Southern Xinjiang line (Turpan-Korla), the Houxi Line (Xian-Yumenkou section) all came online.

New routes to and from northeast China were opened. During the Sixth 5-year Plan, not only was a technical transformation completed on the Beijing-Shanhaiguan line, the Shenyang-Shanhaiguan line, and the Beijing-Chengde line, but the coming online of the Beijing-Tongliao [Nei Monggol] line increased capacity to and from northeast China. In 1985, 23.6 million tons of coal went northward into China's northeast provinces in a 66.3 percent increase over 1980.

4. Routes to areas behind coastal ports. As a result of the construction and opening to traffic of the Beijing-Qinhuangdao and Yanzhou-Shijiusuo lines, and technical improvements carried out on the Jinan-Qingdao line and the southern portion of the Beijing-Guangzhou line, there was a marked rise in railroad capacity in the direction of Qinhuangdao, Qingdao, Shijiusuo and Guangzhou.

Steady Improvement in Design and Construction Techniques

With the expansion of railroad design and construction forces and improvement of technical equipment during the Sixth 5-year Plan, design and construction techniques also improved steadily. For example, the length of the main span and the technology used to erect the Hanjiang splayed steel member box type steel beam bridge was at advanced world standards, and a national gold medal was awarded for it. The 14.3 kilometer long Dayaoshan tunnel is presently the longest tunnel in China. New techniques such as full section excavation were used to create the 200 meter Yuecheng Cave. Excavation has already been completed for 12.3 km and the tunnel is nearing completion. On the Xinxiang-Hexiangqiao line, the exceptionally large Changdong Huanghe bridge is China's longest railroad bridge at 10.3 km. It took only 20 months to build it. Speed of construction was unprecedented. The Haergai-Golmud section of the Qinghai-Xizang Railroad was built on a plateau at between 2,700 to 3,700 meters above sea level, and more than 30 km of it was built across Chaerhan Salt Lake where the geology is complex and the weather very variable. Difficulties in its construction were such as have been rarely encountered in construction anywhere in the world.

Coordination of Yards and Lines By Building More Hubs

Insufficient coordination between the building of railroad yards and railroad lines over a long period of time has made it impossible to either make the most of or improve overall transportation capacity. In order to achieve coordinated development of yards and lines, during the Sixth 5-year Plan improvements and expansion was carried out mostly on the Beijing, Shenyang, Zhengzhou, Xuzhou and Shijiusuo hubs. Following expansion of the Zhengzhou hub, train classification capabilities have increased greatly. The project to expand the Shenyang hub is nearing completion, and classification capabilities there are now nearly twice again as great as they had been before improvements were made.

Increase in Locomotive and Rolling Stock Manufacturing and Repair Capabilities

China's railroad locomotive and rolling stock manufacture and repair industry has always been a weak link. During the Sixth 5-year Plan, forces were concentrated toward improvement, expansion, the introduction of techniques and equipment of industrial plants for a very great rise in production capacity. The Zhuzhou Electric Locomotive Plant had an annual production capacity of only 50 locomotives in 1980. Following improvements and expansion, in 1985 its production capacity increased to 100 locomotives. Production capacity for diesel locomotives also rose substantially. Output of Dongfeng Model 4 trunkline locomotives in 1985 was more than double the 1980 figure. In 1985 a total of 746 new locomotives were built including 385 diesel and electric locomotives. For the first time, China entered a new era in which the number of diesel and electric locomotives produced was greater than the number of steam locomotives produced. New passenger cars numbered 1,447, up 445 from 1980. Newly built freight cars numbered 19,327, up 8,756 from 1980. Repair of passenger and freight cars also increased very greatly. With the steady rise in the country's railroad passenger and freight volume, the numbers of locomotives and rolling stock supplied could not keep up with demand. During the Sixth 5-year Plan China imported a number of diesel engines, freight cars and passenger cars in response to the transportation shortage.

The quality of China-produced locomotives has risen markedly, and the variety of locomotives has also increased. Steady improvement of the quality of the Dongfeng Model 4 trunkline locomotive formed the basis for further research and development of the Dongfeng Model 8 locomotive with 6,400 horsepower that met international standards for large diesel locomotives. During this period, China was able to serially produce electric locomotives, and it developed the Shaoshan Model 3 electric locomotive. It also serially produced Shaoshan Model 3 locomotives. At the same time, in the field of research and development of passenger and freight cars it was able to produce large numbers of new model passenger cars, large heavy duty freight cars and special purpose cars.

In short, achievements scored in railroad construction during the Sixth 5-year Plan were tremendous. They lay a fine foundation for the Seventh 5-year Plan that is about to begin. Nevertheless, railroads face extremely daunting tasks during the Seventh 5-year Plan period. The rank and file of railroad staff employees and workers are now carrying forward the spirit of the foolish old man who moved the mountains in accordance with Central Committee requirements and objectives for railroad work. They are striving to upgrade railroad transportation and usher in a new situation in railroad work.

New Railroad Construction:

Main line track laying: 1,700 km, an average of 340 km per year, with a total of 4,260 km turned over for operation (including amount under temporary management).

Doubletracking: 1,700 km, an average of 340 km per year, with a total of 1,610 km turned over for operation.

Electrified railroads: 2,350 km, an average 470 km per year.

Rolling Stock Output:	1980	1985
Electric locomotive output:	40	100
Diesel locomotive output:	130	285
Steam locomotive output:	342	361
Freight car output:	10,571	19,325
Passenger car output:	1,002	1,447

GUANGXI TO STRENGTHEN TRANSPORT INFRASTRUCTURE CONSTRUCTION

HK191608 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0650 GMT 16 May 86

[Text] Nanning, 16 May (ZHONGGUO XINWEN SHE)--During the Seventh 5-Year Plan period, Guangxi Zhuang Nationality Autonomous Region will build and expand over 30 railroad, highway, bridge, and port projects. It will strengthen the construction of the transport infrastructure in the areas of sea, river, and land transport. It will gradually form a network of sea and land transport systems which link the interior of southwest China to the coastal area of southern China.

On the sea, the region will continue to build the Fancheng Port district and will start building the Beihai Port district. It is expected that the projects will be completed this year. At the same time, the Nanning-Fancheng railroad linking the port to the Hunan-Guangxi railroad will be basically completed this year. Following the completion of the construction of the two ports, which will have a total of nine deepwater berths for ships of 10,000-tonnage, Yunnan, Guizhou, and Sichuan will be able to ship through the ports part of their export goods to Southeast Asia and European countries.

Regarding water transport, it will harness the Xi Jiang and will turn it into the main artery for water transport between southern China and the southwest part of China. The first stage of the project will be basically completed in the Seventh 5-Year Plan period. Fleets on 1,000-ton barges will then be able to sail directly from Guangzhou to Guixian. Yunnan, Guizhou, Sichuan, and Guangxi will be able to transport their goods to the Guangdong, Hong Kong, and Macao regions by using the Guizhou-Guangxi railroad and the railroads in Hunan and Guangxi going to Guixian Port and then sailing down the Xi Jiang. This is the most recent and economic transportation route for provinces and regions in southwest China providing links to Guangdong, Hong Kong, and Macao.

Regarding land transport, the Nanning-Fancheng Port railroad and the Nanning-Pingguo section of the Nanning-Kunming railroad will be completed and put into operation. In addition, the region will build or rebuild 11 highways, including the one linking Baise and Panguan, Guizhou, and the one linking Nanning to Beihai. The region will also repair 20 highway bridges in Wuzhou and over Xijiang, so as to create better conditions for developing the economies of towns and villages.

The above information is carried by JINGJI CANKAO, which is published in Beijing.

TRANSPORTATION

BRIEFS

NATIONAL TRANSSHIPMENT WORK MEETING--Chengdu, 18 May (XINHUA)--The national transshipment work meeting, being held in Chengdu, points out: During the Seventh 5-Year Plan, transshipping departments must speed up development; encourage all sectors of society to develop transshipment; expand transshipping networks centering around cities and extending to townships; and use transport departments' lateral associations to spur the development of lateral economic ties in all localities. The meeting points out: developing transshipment is an important measure to reform the management structure of communications and transport, tap transport potential, and raise the social and economic results of transport. During the Seventh 5-Year Plan, it is necessary to follow the principle of making transport facilities available in all places, extending through transport to cities and towns, and consolidating and improving existing railways and highways. It is particularly necessary to greatly develop through transport in areas where commodity economy has developed along the coast, the Chang Jiang, and the Beijing-Guangzhou, Beijing-Shanghai, Gansu-Lianyungang, and Harbin-Dalian railways. The meeting emphatically points out: Transshipping enterprises must ensure that their transport services are quick, safe, economical, and convenient. They must, following the principle of offering more service for small profits, collect fees reasonably. They are not allowed to collect fees by concocting various pretexts. OFFICIAL PREVIEWS TALKS WITH U.S.--Taipei, 29 April (CNA) -- The Sino-American trade conference gets under way Tuesday to review the ROC's [Republic of China's] duty-free export status under the U.S. Generalized System of Preferences (GSP). The key U.S. representative will be S. Kristoff, the aid to the special representative of that nation's International Trade Commission. Acting as temporary consultant to the American Institute in Taiwan, she will head discussions with local counterparts. The ROC's key representative will be Vincent Siew, director general of the Board of Foreign Trade. Siew pointed out that the agenda will focus on opening the ROC's local market, guaranteeing the protection of intellectual property rights, and workers' welfare, all of which will have a bearing on whether the ROC will be allowed to maintain its duty-free export status under GSP. Siew said the upcoming conference will preface the meetings to be held in the coming months. The trade talks will end Wednesday. [Text] [Taipei CNA in English 0256 GMT 29 Apr 86] /12640

NEW ZEALAND PLANS OFFICE IN TAIPEI--Taipei, 30 April (CNA) -- New Zealand is planning to set up a commercial office in Taipei as a move to strengthen trade relationships between the two countries. Jack A. Hazlett, president of the New Zealand Chamber of Commerce, made the announcement Monday as he visited Wang You-tseng, chairman of the ROC [Republic of China] General Chamber of Commerce. Hazlett is here for one week and will leave on 2 May. In response to the plan, Wang said he would work to provide all necessary assistance in bringing the proposal to fruition. New Zealand, which is rich in agriculture, forestry, and pasturage, mainly exports cheese, wool, leather, beef, and mutton, as well as imports crude oil, machinery, electronic equipment, chemical products, metal, and textiles. During the last 3 years, Sino-New Zealand bilateral trade has averaged U.S. dollars 150 million per year. The ROC suspended diplomatic relations with New Zealand in 1972 after that country recognized Red China. [Text] [Taipei CNA in English 0322 GMT 30 Apr 86] /12640

GOVERNOR REVIEWS FUJIAN DEVELOPMENT STRATEGY

Fuzhou FUJIAN RIBAO in Chinese 17 Nov 85 p 1

[Article by Weng Xinhui [5040 2450 6540]: "Fujian Must Find Its Own Way to Development"]

[Text] "The public impression of Fujian depends to a large extent on its impression of Fuzhou. Therefore, Fuzhou must fulfill its role as a 'pacesetter,' conscientiously sum up experience and be its own trailblazer in the open door policy and development. It must emphasize economic results, attain a high standard, stabilize its market, earn more foreign exchange and send more products into the international marketplace. It must function as a 'window,' a 'link' and a 'shining example.'" So said Governor Hu Ping [5170 1627] as he concluded a 2 1/2-day inspection of urban economic work in Fuzhou.

From the afternoon of 13th this month through 15th, Governor Hu Ping led a group of leading cadres from the provincial government and relevant departments and bureaus to Fuzhou to review our work. They successively visited Fuxin Kinescope Factory, Ronggang Aluminum Co, Ltd, Fuzhou No 1 Plastics Plant, the municipal cold storage plant, the Fuzhou Economic and Technical development Zone and the Shuangfeng Gold Fish Farm and Taijiang agricultural market in Taijiang Village in the outskirts. Wherever he went, Governor Hu Ping invariably immersed himself in the production areas and learned every detail about the production and operations of the concern he was visiting, particularly the amount of foreign exchange required, output value increases and the foreign exchange balance. He was briefed by Mayor Hong Yongshi [3163 3057 0013] and other relevant departments and became acquainted with some of the difficulties and problems facing Fuzhou in its work at the moment. He also discussed the solutions with the officials present.

Governor Hu Ping expressed satisfaction with Fuzhou's recent achievements in reform and the open door policy, particularly the modernization of old enterprises, the introduction of advanced technology and equipment, the Fuzhou Economic Development Zone and urban construction and administration. He said, "My overall impression of the municipality is this: it has had some achievements and acquired some experience. It is full of drive and although it has problems, it also has hope. " Then he asked of Fuzhou a number of things in its economic work in the next 2 years. First, Fuzhou must fully recognize its heavy historical responsibility. As the provincial capital, a hub city, a port city, and an opened city, Fuzhou should become the province's domestic and international window and function as a link and be a shining example. It should also be a new scientific and technical development center. Second, Fuzhou must hack out a path for itself in implementing the open door policy and development, instead of following in others' footsteps. It should exploit its own strong points and minimize its weaknesses, such being the only way to be competitive. Moreover it must pay attention to product renewal and succession, import new technology and develop new products. Third, in its economic work in the next 2 years, Fuzhou should focus on four aspects: emphasize economic results, improve standard, earn more foreign exchange and stabilize the market. As an opened city, Fuzhou should take pains to earn foreign exchange. It can go in for processing with imported materials, compensatory trade, labor export and so on. Fourth, it must unleash the initiative of all sectors of the population and mobilize the entire city's workers, peasants, scientific and technical personnel and overseas Chinese to come up with ideas to accelerate the municipality's development. Fifth, it must strengthen urban construction and administration and, depending on its actual conditions, adopt modern managerial techniques to run the city.

Governor Hu Ping also hoped that the various relevant departments in the provincial government would actively support Fuzhou's development by providing information, technology, projects and funds. He was accompanied by Vice Governors Wang Yishi [3769 0001 1102], Chen Mingyi [7115 2494 5030] and Chen Binfan [7115 1755 5672] on his inspection tour.

IMPROVING AIR SERVICE, TELECOMMUNICATIONS IN ECONOMIC ZONES

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 16 Dec 85 p 3

[Text] Officials from the Civil Aviation General Administration disclosed a few days ago that airport construction will be completed and air routes established at all special economic zones [SEZ's] and opened coastal cities in the early part of the "Seventh 5-Year Plan" period.

Of the 14 opened coastal cities and 4 SEZ's, 15 cities have air links with other places. Airport construction or expansion is under way in Beihai, Wenzhou and Nantong. These facilities will be put into service in the next couple of years.

In the year or more since China further opened 14 coastal cities, Yantai, Ningbo, Qinhuangdao and Lianyunguang have successively become accessible by air. The Civil Aviation General Administration has set up over 20 air routes flying into opened cities, increased scheduled flights between Shanghai and Japan and the U.S., and added three international air routes linking Beijing with Australia, Singapore and Kuwait, all via Guangzhou. There are now scheduled or charter flights between the six cities of Guangzhou, Shanghai, Xiamen, Tianjin, Fuzhou and Haikou, and Hong Kong.

Government investments and local funds have made possible the construction or expansion of more than 10 airports in opened coastal cities. After expansion, airports in Dalian, Qingdao, Haikou and Zhanjiang can now accommodate the landing and take-off of wide-body jets. Xiamen used foreign capital to build its international airport and founded the Xiamen Aviation Company which now offers services between Xiamen and nine domestic and foreign cities.

It has been learned from the Ministry of Posts and Telecommunications that China is stepping up the construction of telecommunications facilities in SEZ's and opened coastal cities. Estimates are that those facilities will be able to provide foreign investors will telex services next year. By 1987, international long-distance automatic dialing will be available in most cities.

An official from the Ministry of Posts and Telecommunications said that program-controlled telephone switchboards imported from abroad have been put into service in Shenzhen, Guangzhou, Fuzhou, Xiamen and Tianjin to handle municipal and long-distance calls. Similar switchboards are expected to be operational in most other coastal cities next year.

The official said that the following projects, now under construction, are scheduled for completion and operation next year: the 1,800 channel microwave between Nanning and Beihai; the 960 channnel microwave between Xuzhou and Lianyunguang; and the digital microwave circuit between Haikou and Sanya (on Hainan Island), which has a transmission speed of 2 x 34 megahertz. The 960 channel, small concentric-lay cable between Pingdu and Yantai is also under intensive construction.

Two international communications exchanges are being built in Beijing and Shanghai and will go into operation at the end of next year or early 1987, upon which international long-distance automatic dialling services will become available in cities with program-controlled switchboards.

Officials from the ministry said that the government has also installed much-needed semi-automatic international long-distance telephone facilities in SEZ's and opened coastal cities, most of which are expected to be delivered to users by the end of the year.

Minister of Posts and Telecommunications Yang Taifang [2799 3141 5364] has said earlier, "Automatic dialing for international long-distance calls will gradually become a reality in provincial capitals, economic centers and opened coastal cities in the next 5 years."

BRIEFS

FOREIGN CAPITAL IN QINGDAO--Qingdao is accelerating the pace of utilizing foreign capital. In only a bit more than one year's time it has signed 47 contracts to utilize foreign funds at a direct investment of more than $115 million. Some 15 of the projects are joint or cooperative ventures using more than $106 million. Characteristics of Qingdao's foreign fund usage follow: 1. Foreign investment is mainly directed toward industry. Some 60 percent of the 15 joint and cooperative venture projects for which contracts have already been signed are of a productive nature. Rather large projects include the Hualin Plywood Co Ltd, a joint venture between the Qingdao Furniture Co and Finland, with a total investment of $18.88 million and the Qingdao No. 2 Brewery, a joint venture between the Qingdao Beverage Co and Hong Kong and Macao, with a total investment of $58 million. 2. The goods are mainly sold abroad. All quartz and electronic watches produced by the joint venture between the Qingdao Watch Works and Hong Kong are sold abroad. Dry white wine produced by the Huadong Grape Rice-Wine Co Ltd and plywood made by the Hualin Plywood Co Ltd is exported, 90 percent and 72 percent, respectively. All other projects are also able to achieve a foreign exchange balance. 3. The emphasis is on the development of technology-intensive light, textile and electronics industries. Joint and cooperative ventures in these industries account for 82 percent of the total amount invested. [Text] [Jinan DAZHONG RIBAO in Chinese 7 Nov 85 p 2] 12615

FINANCE AND BANKING

REFORMS IN BANKING SYSTEM OUTLINED

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 17 Nov 85 p 1

[Article by Zhang Yushu [1728 3768 2579] and Liu Xiao [0491 7197]: "Ten Point Reform of China's Finance and Banking System Carried Out. Beginning Made in Comprehensive Use of the Role of Economic Levers. Continuing Efforts Required to Eradicate Existing Shortcomings"]

[Text] Chinese People's Bank Deputy Director Liu Hongru [0491 7703 0320] noted recently in a conference of managers of Chinese banks and insurance companies abroad that after several years of reform, China's banking and finance system has made a preliminary start at getting rid of its image as purely a "paying and receiving agent" for savings and loans and has taken major strides along the road toward a "bank that really does banking and makes use of the role of economic levers."

Deputy Director Liu said that China's finance and banking system had carried out reforms mostly in 10 regards since 1979 as follows:

A start in change of mentality of "stressing loans and slighting savings," focusing attention to the use of economic methods to expand savings and amass funds. Concurrent with the expansion of self-determination in enterprises and a rise in the people's earnings level since 1979 has been a rise in bank interests rates on savings accounts, an increase in the number of savings accounts, the establishing of more outlets at the grassroots level, and a tremendous increase in bank deposits. During the six year period 1979 through 1984, the annual increase in deposits averaged 38.1 billion yuan for an annual 20.2 percent growth.

Expansion of the scope of loans and broadening of eligibility for loans. A change has been made from the issuing of loans only for use as circulating funds to issuance of loans for fixed assets; from the issuance of loans principally to state-owned enterprises to issuance of loans for economic diversification and to individuals; and from the issuance of loans only in the production and goods circulation areas to issuance of loans to all trades and industries. Now the bank may make a loan so long as it is socially necessary, is in keeping with policy provisions and can be repaid.

Reform of the loan control system, demolishing some of the red tape surrounding the "supply system," and a beginning to apply loan and interest economic levers to promote a rise in economic effectiveness.

Preliminary reform of the undiversified modes of bank credit, trying out flexible and varied credit forms. For example, commercial credit, credit to sellers, discounting of bills, consumer credit and trust business have played a positive role in enlivening the economy. Some places have issued checks and business debentures as means of amassing more funds.

Reform of the foreign exchange control system and the foreign exchange credit system, expanding monetary dealings with foreign countries. Reform of foreign exchange controls, institution of a withholding system, and flexible readjustment of foreign exchange prices have promoted foreign trade. In addition, the most has been made of the role of banks as windows for raising money from outside China and for operating various kinds of foreign exchange savings and loans businesses.

Reform of the banking system and establishment of a central banking system with separate specialty banks, founding of many other kinds of financial institutions, and preliminary formation of a cooperative financial system with the central bank at the center, in which specialty banks play a major role and in which other financial institutions share labor.

Reform of the credit funds control system. Banks instituted a control system consisting of a centralized internal planning, level by level management, linking together of savings and loans, and responsibility for shortfalls. Unified planning among all banks, dividing up of funds, loans based on deposits and a mutual accomodation management system were instituted, which rather effectively aroused the enthusiasm of government and banks at all levels for comprehensive control of credit funds.

Revival of the insurance business within the country, and establishment of an insurance economic compensation system. With expansion of the commodity economy, we rapidly revived and developed the internal insurance business that had been halted for 20 years, and the number of kinds of insurance have increased to 120. In addition, foreign insurance has also rapidly expanded, the kinds of insurance increasing to more than 30.

Preliminary change in the nationwide unified receipts and disbursements financial control system and bolstering of economic accounting.

Preliminary establishment of a bank economic information network and buttressing of economic research and theoretical research to provide large amounts of valuable forecasting for economic reform and to increase the effectiveness of the macro-economy.

Deputy Director Liu Hongru believes that though the reforms carried out so far have been only prelimiary and partial, and that even though various shortcomings existing in the country's financial and banking system have not been fundamentally eradicated; nevertheless, the thrust of reform is toward the target and its effect is immense. They should be continued and steadily expanded and improved.

FINANCE AND BANKING

BANK OF CHINA IN SHANGHAI KEY SOURCE OF JOINT VENTURE LOANS

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 3 Nov 85 p 3

[Article by Chen Maodi [7115 3029 1717]: "Shanghai Branch of Bank of China Expands Business. Further Expansion of Scope of Loan Business. Supports Needs For Chinese and Foreign Joint Venture Capital"]

[Text] Business has steadily increased during the past 2 years at the Shanghai branch of the Bank of China and achievements have been scored.

The deputy director of this bank branch which specializes in foreign exchange,Zhou Mengxiong [0719 1125 3574], recently spoke of several achievements to reporters that demonstrated progress in expansion of the branches' business.

He said that the Shanghai branch bank had made loans to more than 70 percent of the Chinese and foreign joint venture businesses in Shanghai. Chinese and foreign joint venture businesses in which it had invested included not only the Shanghai Dazhong Automobile Co.Ltd., but also in a Shanghai joint venture with Pilkington Co. of England for float glass, a joint venture with the Hong Kong Globe Toy Co. for zinc alloys, and a joint venture with the United States Consolidated Marine Petroleum Company.

The Shanghai branch bank now offers bank guarantees and notary public services, providing guarantees on loans for domestic and foreign customers.When a German bank provided the container factory of the Shanghai Shipyard with a 22 million mark loan in what was Shanghai's largest compensation trade processing imported materials--importing a conveyor production line and materials from the Federal Republic of Germany for the production of containers--the Shanghai branch ofthe Bank of China provided the final reimbursement gurantee,bringing the project to a settlement.

Zhou Mengxiong also indicated that the bank will continue expanding its range of services,including the following:

--Further expansion of the scope of loan services to support loan requirements of Chinese-foreign joint venture enterprises, including providing various operating capital and fixed asset loans;

--Active participation in syndicated loans with foreign banks;

--The providing of loan and credit services to foreign investors; and

--Development of its "pivotal" and go-between roles in attracting foreign capital.

Deputy director Zhou Mengxiong said that Shanghai will continue to encourage attracting of foreign investment and welcome even more foreigners to come and set up factories. The Shanghai branch of the Bank of China will provide better services in aspects such as loans and accounts settling, and is also willing to participate in cooperative ventures with foreign businesses.

BANK OF CHINA OVERSEAS BRANCH DIRECTORS MEET IN BEIJING

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 3 Nov 85 p 3

[Article by Liu Xiao [0491 7197] and Zhang Yushu [1728 3768 2579]: "Bank of China Pioneers Business Abroad. Very Great Increase in Both Savings and Loans During Past 6 Years. Directors of All Overseas Branches Study and Discuss Plans in Beijing"]

[Text] The work of both the Bank of China and other Chinese banks abroad has expanded appreciably. Between 1978 and 1984, business volume increased 4.4 fold. The information was obtained by this correspondent from the meeting of directors of overseas branches of the Bank of China, which opened in Beijing on 1 November.

A briefing placed the number of Bank of China branches abroad at 293, and the number of employees at more than 9,500. The scope of operations has expanded steadily and business is in process of developing in the direction of becoming more diversified and internationalized. Business vitality has become stronger and the level of management has risen. As of the end of 1984, the total value of assets in branches abroad amounted to $18.3 billion, up 2.9 fold from 1978. Savings deposits amounted to $9.6 billion, an almost twofold increase from 1978, and loans amounted to $4.7 billion, a more than threefold increase from 1978. In addition, the financing capacity of branches abroad has markedly improved and both influence and confidence have increased. Chinese banks in the Hong Kong and Macao area have preliminarily formed into a bloc that has become an increasingly important element in the stability and prosperity of Hong Kong and Macao.

Branches abroad have made considerable strides in supporting China's four modernizations. In 1984 alone, banks in the Hong Kong and Macao area directly or indirectly used more than 500 loans totaling more than HK$4 billion for construction or trade in China, and they worked jointly with other units concerned in Hong Kong in the holding of urban investment meetings open to the public for the promotion of Chinese and foreign economic cooperation. London, New York and Singapore branches have suported the building of some major projects in China through export loans and banking group loans. All branches are urging customers to invest in China and they have done much work in providing them information, credit surveys and consulting services.

The main topic for discussion at the meeting of the directors of Bank of China overseas branches was how these branches could better serve the building of China's economy during the period of the Seventh 5-year Plan. The conference will draw up a work plan for the Seventh 5-year Plan period based on a summarization of work done at the conference, and the meeting will close on 23 November.

INDUSTRY

TECHNOLOGICAL PROGRESS, DEVELOPMENT OF STEEL INDUSTRY

Shenyang DONGBEI GONGXUEYUAN XUEBAO [JOURNAL OF NORTH EAST INSTITUTE OF TECHNOLOGY] in Chinese No 4, Dec 85 pp 107-114

[Article by Shao Xianghua [6730 6272 5478]: "Iron and Steel Industry Develops Rapidly Amidst Technological Progress"]

[Text] Iron and Steel Industry--"Sunset Industry" Or "Sunrise Industry?"

China has a long history of metallurgy but its modern iron and steel industry began to develop only after the founding of New China. Its steel output in 1983 was 40,020,000 tons, which ranked fourth in the world. This is a great achievement that deserves cheers.

During the past 35 years the development of China's iron and steel industry went through several major phases of ups and downs. During the periods of recovery and the First Five-Year Plan between 1949 and 1957, the growth of steel output was normal and exponential. From 1958 to 1960, high quotas were pursued and output doubled but it created serious imbalance in the national economy, and during the "hard times" that followed output essentially dropped to the initial level prior to the Great Leap Forward. From 1962 to 1966, the industry returned to normal growth but with the start of the 10 years of turmoil steel output fell sharply once more. Subsequently it went up and down repeatedly, finally fluctuating around 23,000,000 tons for 6 or 7 years. Relatively stable growth resumed after the cultural revolution, and by 1983 output exceeded 40,000,000 tons. We can very roughly assume that without those two major disruptions and if the iron and steel industry had been able to expand in a normal way, then even if the growth rate was slower than that of the period 1952-1957, an annual output of 40,000,000 tons could have been reached even before 1970. It should be pointed out that such growth is possible. Among the three countries whose current steel output is higher than China's, Japan had indeed achieved relatively stable high rate of growth from the time after the Second World War to the 1973 oil crisis, attaining an output of 119,000,000 tons in 1973. The growth of the Soviet Union's postwar steel output was even more stable and sustained, with an output of 151,000,000 tons in 1978. U.S. steel output exceeded 100,000,000 tons as early as the mid-1950's. Subsequent fluctuations were great, but it also set a record of 137,000,000 tons in 1973.

After the early 1970's the development of iron and steel in the major steel-producing countries underwent fundamental changes. The steel output of the U.S. and Japan underwent great fluctuations and the overall trend was a sharp decline, of which the U.S. output fell to half of that in 1973. The circumstances with Western European countries were similar. Soviet steel output did not fluctuate much but even so it ceased to grow after 1978. At the same time, the growth of the iron and steel industry in some Third World countries and regions was noticeable, particularly the Chinese mainland (see above), the Chinese province of Taiwan (which grew from 470,000 tons in 1971 to 50,300,000 tons in 1983). South Korea (which grew from 550,000 tons in 1971 to 11,920,000 tons in 1983), and Brazil (which increased from 6,000,000 tons in 1971 to 14,650,000 tons in 1983).

The serious recession in the U.S. iron and steel industry during the last 10 years or so occurred at the same time as the recession in its other traditional manufacturing industries such as automobiles and heavy machinery. Be because it leads the whole world with the rapid development of its "high-tech" economy represented by electronic computers, during this period the U.S. economy did not collapse because of its sagging basic manufacturing industries but its GNP continues to rank first in the world.

Such an intensive change in the U.S. economic structure would certainly cause active reactions from the circles of thinkers. Through the news media and some "best sellers" in the past decade, a number of thinkers and futurists represented by Baier, Toffler, and Nesbitt successively put forth new views on social development which captured the attention of many people and transmitted abroad. In their view, mankind began to move from a primitive towards an agricultural society 10,000 years ago and began to move towards an industrial society 200 to 300 years ago. But now it has reached a new stage and is advancing in an ever-increasing pace toward a "post-industrial society," "super-industrial society," "high-tech society," "information society" or "the third wave of civilization" (different terms are used by different authors). It is evident from their writings that this new society they speak of generally refers to one characterized by computers, information transmission and processing, new sources of energy, new types of materials, marine development, biological techniques and robotics. Reportedly, the majority of people in this society no longer engage in the production of goods but provide services, and so-called services are in fact primarily the creation, processing and distribution of information. Some of them use the term "sunset industry" to describe the capital-intensive traditional manufacturing industry including the so-called "smoke stack industry," and maintain that they are rapidly being eliminated. They also blame their government which has adopted certain policies aimed at increasing production for being "short-sighted," "prolonging the life of dying companies" and "hindering the growth of 'sunrise industry'."

Industrially advanced countries, particularly the trend of growth and opinion in the U.S. described above, greatly differ from China which is concentrating its strength on the four modernizations and therefore this deserves our attention. Lately, some of their books have been published in China, some video tapes have been shown and a great deal of interest has been aroused. Their viewpoints described above have exerted considerable influence on some people. In order to clarify this issue, I have recently looked into and studied the writings of those futurists and special American publications and checked with well-known figures in science and technology who have visited China and found the following points worth noting.

1. What those futurists describe are circumstances in the American society. Although they speak of the course of development in the U.S. as the fore trend of the entire world, at least they have not clearly stated that countries which have developed industrially late should also abandon industrialization in favor of information now. On the contrary, some authors have stressed global mutual economic coordination and argued that the world should become one in which "countries depend on each other." Clearly, what they mean is that basic manufacturing industries should be left to the Third World while the Americans themselves engage in a "high-tech" economy.

2. The viewpoint that sets up an antithesis between "high technology" and industrialization or basic manufacturing industries does not have general support in the American society. I have asked several well-known American professors who visited China this year and they replied that they had not heard of any argument for the imminent elimination of "sunrise industry," "sunset industry" and basic manufacturing industries in the U.S. A council member of the Chinese Academy of Sciences who has recently returned from a visit to the U.S. also said that he posed the same question with the same concern to many authoritative figures in scientific and technological circles in the U.S. and most people gave the same response. Clearly, the argument for industrialization giving its place to information has not aroused much interest even in the U.S. itself or at least American scientific and technological circles.

3. It is true that some people in the American industrial circles and scientific and technological circles have published their opinion on the viewpoints described above, not in favor of them but against them. For instance, the "outstanding speech" on materials and society in 1983 (written by Smith) of "Metallurgical Transactions," one of the most important publications in metallurgical studies in the U.S., used a great deal of facts to illustrate that the main causes of the great difficulty encountered by the American mining and metallurgical industry in recent years are not the frequently cited reasons of depletion of resources, environmental pollution and international competition. Rather, they are of social causes, confusion caused by some people who take advantage of the "freedom of speech" and forget their own responsibility toward the society and carry some of their own deductions to the extremes. In the same way, as pointed out by Timken Company's chairman of the board in his articles, if Americans indeed agree that they must abandon manufacturing industries and act on it, it will create disastrous consequences for the American economy since weakening basic industries will inevitably weaken overall economic strength. The current president of the American Society for Metals pointed out in a recent report that the output value of basic industries in the early 1970's made up 48 percent of the total manufacturing output value but it was 51 percent in 1981 (output value of "high-tech" industry in the same year was 22 percent), so evidently basic industries are still the cornerstone of the U.S. economy. He also stressed the close connection

between basic and high-tech industries, the necessity of common growth, and the indispensability of both. It would appear that in the U.S. itself, people in scientific and technological circles and industrial circles differ greatly in their views from the futurists mentioned above. What they stress is the need to strengthen basic manufacturing industries, fully adopt modern technology in basic manufacturing industries and fully utilize "high technology" to rescue heavy industry.

4. The structural reform in the change from an industrialized society to a "post-industrial society" does not conform to U.S. national policy. It should be pointed out that national policy is frequently contradictory and inconsistent in a country such as the U.S. Pressured by public opinion, different parts of the U.S. have indeed carried out many policies that are unfavorable to the growth of traditional industries such as excessively strict environmental protection regulations, excessively high wage scales and the disadvantageous tax system. But as a representative of general policies, the U.S. Congress passed the National Materials Policy Act in 1970 and stressed the need to maintain a strong mining and metallurgical industry for the national economy and national security. In 1980 it again passed the National Materials and Minerals Policy Act which was similar in substance. "Basic research on iron and steel" was one of the 15 key areas of engineering technology in the next decade as put forward by the U.S. National Science Board earlier this year.

I think it is clear from the above that the argument of industrialization being outdated, which has continually appeared in American society in the last decade, is only born in the minds of some thinkers in reaction to the prolonged depression in the industries. It is transmitted through large-scale public opinion media and popular literature and is spread more widely than serious writings so that it has created considerable influence over the general public and has indeed created unfavorable conditions for industrial growth. I believe that if we treat such a one-sided view as a matured theory and allow it to have extensive influence in China, our determination and confidence in our efforts in the four modernization drive will be hindered.

China's steel output currently ranks fourth in the world but its import of steel products is also among the highest. When China's gross industrial and agricultural output value quadruples by the year 2000, even more steel products will inevitably rely on imports. This condition is very abnormal and we must narrow the gap as much as possible. Our party and government are leading iron and steel circles in the country in an effort to accomplish this. If countries which are developed in iron and steel indeed abandon or weaken their iron and steel production according to the arguments of those futurists, then it will be even more urgent for us to develop our own iron and steel industry at high speed. In this sense, their "major trend" is a challenge for us.

In order to narrow the critical gap in China's steel products in the future, we must never rely on what certain prophets say, replacing them with "more advanced" materials. The use of other materials (such as aluminum, plastics, composite materials, and ceramic materials) to replace iron and steel for certain purposes has already been realized and undoubtedly this will have to be expanded in the future. But evidently, due to limitations of technology and economic considerations, the quantity and variety of possible substitutes can constitute only a very small portion for a long time to come. Therefore, our only choice is to assimilate, develop and create even more advanced iron and steel techniques, technology, equipment, and processes through science and technology and other areas in order to build a new foundation for the future. Therefore, in my opinion, the iron and steel industry is not a "sunset industry" in the U.S. and less so in China; it is a "sunrise industry" that has developed along with the growth of New China which still needs to be actively expended in the future and which will distinguish itself and flourish in the four modernizations.

If we do not regard "high technology" as an uncompromising competitor of traditional industries but as a partner that helps each other forward, the reform and growth of traditional industries will be enormously aided by traditional industries. In the iron and steel industry, computer-aided management, operating control, and design have already produced important economic results, and it is highly likely that they will be more fully utilized and developed. The use of the laser as a method of metallic finishing and a basis for test technology has already been realized and its future is bright. The use of biological techniques to develop new methods in prospecting, ore dressing, and fighting environmental pollution has yielded results. Marine development has provided the metallurgical industry with new resources. New low-cost energy will remove a serious limitation to the growth of iron and steel. It is evident from these examples alone that in the short run or the long run, the development of "high technology" will provide numerous opportunities to the growth of the iron and steel industry. Metallurgical scientists and technicians should not let these opportunities pass by but should make use of and develop them. Conversely, the growth of "high technology" itself requires a great deal of metallic materials with new functions, many of which must be undertaken by the iron and steel industry. This is a challenge as well as an opportunity.

Some Views on New Technology in Iron and Steel Production

Prolonged depression in the iron and steel industry abroad has made international competition even more intense. This has resulted in a great deal of technological transformation and even new technology and processes so that the face of iron and steel works continually changes, laying the foundation for future growth. One may say that progress in the iron and steel industry is also in the ascendant worldwide. From our vantage point, those people who maintain that it is rapidly declining are far out of touch with reality.

Extensive work has begun in many areas of China's iron and steel production technology, some of which have already yielded tangible economic results. I will discuss ideas and suggestions on several major areas of development for use as reference.

1. Converter composite blowing

Compared to top-blown converters, bottom-blown converters which came out in the 1960's have good molten bath mixing so that they have brought advantages including a high rate of return, ecomonization of deoxidants, ease in smelting low-carbon steel and increased capacity. In a matter of several years they have built a production capability of 30 to 40 million tons in several countries.

However, bottom-blown converters came out after many large modern enterprises were established in various countries, and along with the depression after 1973 they quickly ceased to expand and some of the ones constructed have even stopped or cut down production. The depression set off competition for survival among enterprises which all sought to increase efficiency. People quickly discovered that results essentially similar to those of bottom-blown converters can be produced by merely blowing in a small quantity of gas at the bottom of top-blown converters. Once this so-called "composite blowing" came into existence it spread quickly throughout the world. Today, the absolute majority of top-blown converters in Japan and major steel producing countries in Western Europe has been transformed into composite blowing. Bottom-blown converters which have been constructed have also been installed with top oxygen blowing, resulting in a new form of composite blowing. Small wonder someone has predicted that no longer will anyone build converters that are purely top- or bottom-blown.

Like other new technology, there is a great variety of composite blowing. The founder of each method makes up his own name, and as a result a large number of names for composite blowing, totalling more than 20, has appeared from top-blown to bottom-blown converters.

These methods primarily differ in: (1) the quantity of bottom-blown gas, the type of gas used (argon, nitrogen, air, carbon dioxide, or oxygen), and the method of blowing (double-layer casing, circular seam pipes, seamed bricks, porous plugs); (2) the quantity and form of top oxygen supply; (3) whether solid materials are sprayed at the same time (flux or fuel). Many steelworks in China have adopted composite blowing for their original top-blown converters and have obtained good economic results. The Wuhan Iron and Steel Works uses argon. The Ma'anshan Iron and Steel Works, which is experienced in bottom-blown converters uses oxygen. Most of the other steelworks currently use nitrogen. The Capital Iron and Steel Works has tested the use of nitrogen in the former phase and switched to carbon dioxide in the latter phase. The gas intake components used by the various steelworks include all the varieties except porous plugs.

It is natural that each steelworks uses the most economical and effective method of composite blowing under its own circumstances. There is no need to demand uniformity. Some overall views on composite blowing are discussed below:

(1) The key to metallurgical results and economic benefits in composite blowing described above is mixing. The strength and weakness of the function of mixing is determined primarily by the quantity of airfow, and secondarily by factors such as the type of gas used and the way it is blown into the molten bath. But blowing nitrogen tends to increase the amount of nitrogen in the molten bath when blowing oxidizing gases plays a strong role in the corrosion of refractory materials particularly in the latter phase of smelting.

Argon is the most ideal mixing gas but it is too expensive. A rational way is to blow other gases in the former phase (determined by the specific conditions), and switch to argon in the latter phase. Argon should be recovered in the steelworks' own oxygen station and supplied for converter mixing and other uses.

(2) Compared to those in Japan, the U.S., and many in Europe, the sulphur content of molten iron is relatively high in quite a few steelworks in China. Intensifying the effect of mixing on molten bath dephosphorization is a complex problem. People frequently say that composite blowing is beneficial to dephosphorization, meaning that the phosphorus content of slag at the end of the latter phase of converter blowing is lower than the balance value, and that intensifying mixing can enable even more phosphorus to enter the end slag and lower the amount of end phosphorus. On the other hand, it is precisely a state of deviation from balance that can impel any reaction to take place; slag concentration (ferrous oxide) exceeding the value of molten steel balance can speed up dephosphorization. Therefore, if the molten iron is high in phosphorus, intensifying mixing may in fact lower the productive capability of converters. For steelworks which use raw materials high in phosphorus, the best mixing system needs to be determined through tests in order to assure the required degree of dephosphorization and at the same time without being too high in the end slag (ferrous oxide).

2. New technology of higher scrap steel consumption by converters

The growth of converters and decline of open-hearth furnaces have caused a surplus of scrap steel in the world. This makes higher consumption of scrap steel by converters an issue with strong economic significance. Compared to top-blown converters, the scrap steel consumption capability of bottom-blown converters and composite-blowing converters is much lower. Many bottom-blown converters abroad can amend this shortcoming by blowing oxygen on the top so that the carbon monoxide in the converter gas is burned into carbon dioxide.

This is also one type of composite blowing. For the same purpose, many composite converters refitted from top-blown converters also have the structure of their top-blown oxygen guns transformed to supply oxygen for secondary combustion (double-flow oxygen gun) apart from the main oxygen flow. Based on the experience abroad, this can enable the scrap steel ratio to regain its original level in top-blown converters or even surpass it. But the quantity of carbon monoxide generated in converters is limited by the composition of molten iron while secondary combustion reaction cannot fully take place under high temperature conditions inside converters. Consequently the ability to increase the scrap steel ratio by the this method alone is limited, which is under 100 kilograms per ton of steel.

One way to drastically increase the scrap steel ratio is adding more fuel to converters. Over a decade ago some steelworks abroad added coal or crushed coke into ordinary top-blown converters and were indeed able to somewhat increase the quantity of scrap steel, but terminal control was difficult and there were dangers of increased nitrogen in molten baths and hindrance to dephosphorization. Subsequently, two steelworks in Britian and Holland cooperated in using double-flow oxygen gun on a 100-ton composite-blown converter and adding anthracite through the mouth at the same time, but the increase of scrap steel did not exceed 30 kilograms per ton.

West Germany has recently developed several methods to increase the scrap steel ratio by simultaneously blowing in gum and powdered coke at the bottom of bottom-blown converters. The KMS method, which has been in production for many years and which consumes 55 kilograms of coal per ton and 90 cubic meters of oxygen per hour, can reach a scrap steel ratio of 50 percent. Moreover, two 125-ton converters have been built using the KS method with the aim of using 100 percent scrap steel (and sponge iron) as raw materials, which competed with the super-high power electric furnace. Further more, there is the COIN method which is being tested and which differs from the KS method primarily in the construction of their bottom-blown components.

China has a smaller supply of scrap steel than Europe and the U.S. and there is no demand for converters to use 100 percent scrap steel as raw materials. But increasing the scrap steel ratio is still an issue of great economic significance and it become even more prominent for converter plants which use semi-steel as raw materials. Besides, quite a few converters in China currently use molten iron from cupola furnaces as raw materials and each year they consume millions of tons of high-grade coke, which is not economical. We believe that by learning from the experience of West Germany and by studying and developing our own composite blowing methods of blowing coal and oxygen, we can tackle the problem of certain plants in drastically increasing the scrap steel ratio and provide a method to curtail and even avoid cupola smelting.

The purpose of the COIN method of West Germany is not limited to the consumption of scrap steel by converters. Further research is being undertaken to use waste gas of coal-spraying converters as the reducing reagent of iron ore and the iron after reduction as the raw materials for coal-spraying converters. In this way, the growth of composite converters is intertwined and combined with reduction by melting, forming a new iron and steel production process which is discussed in the next section.

3. Direct reduction and reduction by melting

Integrating the new (pangang) process, China has done a great deal of research on direct reduction. Extensive research on reduction by melting has been undertaken abroad in recent years. Quite a few units in China are also planning to develop this work on a new basis.

These methods have several major features as compared to traditional iron melting by the blast furnace: (1) non-reliance on coking coal resources; (2) economical production can be achieved on a relatively small scale; (3) low investment cost and fact construction of plants.

Sponge iron produced by direct reduction can substitute part or even all of the scrap steel as raw materials for steelmaking by electric furnaces. Direct reduction--electric furnace used as a blast furnace--the process other than the converter, has once made progress abroad. But the most matured direct reduction method in the industry, such as MIDREX and HYL, used natural gas as energy and therefore could not continue to develop particularly after the oil crisis. So far there is no economically tenable and reliable method for direct reduction based on solid fuel. Consequently, even though the prediction that direct reduction would replace the blast furnace has been going around for several decades, currently at least 98 percent of the steel output in the world is produced by the blast furnace.

The other method of iron-smelting not using the blast furnace is reduction by melting. Iron ore is melted and solid carbon is then added for reduction, and the conditions for heat and mass transfer are better than the gas-solid low temperature reaction of the direct reduction method and a very high speed in reduction can be reached. Moreover, coal (or powdered coke) can be used as solid carbon, eliminating the necessity of using metallurgical coal as well as natural gas. Perhaps this is why the growth of research on reduction by melting in the world during the past decade has been more active than direct reduction.

However, there are essentially two serious weaknesses with reduction purely by melting: (1) it is difficult to economically tackle the corrosion of refractory materials by melted ferric oxide; (2) restricted by thermal dynamic balance, under high temperatures (such as 1600°) the ratio of carbon dioxide/carbon monoxide in the gas phase which come into contact with iron-ferric oxide is very low, and consequently the unit consumption of carbon is high and not comparable to the blast furnace. Certain methods of reduction by melting such as ROTORED and CIP that are being studied and tested use centrifugal force to avoid the corrosion of furnace lining by ferric oxide but there is no solution to the high consumption of coal.

In order to overcome the two weaknesses mentioned above, many types of test processes for reduction by melting abroad have now added a pre-reduction process. First, partial reduction is carried out in low temperatures on ore (or pellets) in solid state, and then high-temperature melting and final reduction are carried out in another reactor. The heat source and reduction reagent of the former utilize the waste gas of the latter. Some of these processes are being tested while some have only been proposal, and there are more than 10 types. The end reduction of several types uses electricity as the heat source, and this is very similar to the sponge iron-electric furnace process mentioned above.

Reduction by melting is intended to get rid of the solid-state reduction of the direct reduction method previously developed (this process is called indirect reduction in blast furnace!), while the present trend is to combine the two, forming a two-step method which combines solid and liquid states. How similar is this course of development to that from top-blown converter to bottom-blown converter and to composite blowing! In fact, was not the familiar blast furnace at first a method to combine solid-state reduction and reduction by melting? After spending a great deal of efforts, a basic chemical process has taken a roundabout way and apparently returned to the original spot. But all this is to create even more economical technology and processes under specific resource conditions so that it is very worthwile.

China is launching more serious research and testing of reduction by melting. In my opinion, in order to avoid detours and to assure that the growth of the iron and steel industry will truly play a role in the year 2000 and after, we must have clear goals, aim at specific conditions of regions or enterprises, formulate the most optimum programs, and conduct research and tests scienfiically. The work outside China, particularly KR under Austrian-West German cooperation as well as COIN of KRUPP, are worthy of reference particularly for areas where ores and coal are available but are short of electric power.

4. Pre-treatment of molten iron

The earliest pre-treatment of molten iron realized is the desulphurization of ladle soda ash. Later, primarily because provisions on sulphur content of steel became increasingly strict, many types of relatively particular pre-desulphurization techniques appeared when used carrier gas dusting, mechanical mixing and other principles. Desulphurizers also became diverse, extensively using calcium carbide, lime base mixtures and metallic magnesium. Today, the method of desulphurizing most of the molten iron to below 0.02 percent and part of it to below 0.005 percent has already been achieved in some iron and steel works.

The method of desiliconization of molten iron existed half a century ago and the purpose was to decrease the amount of slag during steelmaking and improve the capability to dephosphorize and desulphurize. Later, advances in blast furnace operations itself made it possible to lower the silicon content of molten iron and stabilize it (average approximately 0.7 percent in the U.S. and 0.3 percent in Japan; higher consumption of scrap steel by silicon in converters is advantageous), consequently pre-desiliconization techniques did not develop for a long period of time. But in recent years, particularly in Japan (low scrap steel operation), desiliconization of molten iron has again been placed on the daily agenda. It should be pointed out that the amount of silicon, sulphus and phosphorus in molten iron in Japan used to be quite low. Besides metallurgical benefits, there is one other major economic objective for the Japanese to desiliconize further, namely to totally use up the furnace slag of the iron and steel works without any accumulation. Concerning methods of desiliconization, Shin Nihon Seitetsu's tapping launder continously blowing technique merits our attention.

Alkaline converters are basically very capable of dephosphorization, but the problem of pre-dephosphorization of molten iron was studied long ago. In 1965 someone in West Germany proved in the laboratory that soda ash combined with an oxidizer can simultaneously desulphurize and dephosphorize but it could not go into use because of economic and environmental reasons. A Shumitomo plant in Japan developed this method for industrial production by first desiliconizing a small quantity of the molten iron and then dephosphorizing it by blowing soda ash. The phosphorus content of the molten iron of that plant was not high to start with (0.1 percent) and the purpose of pre-treatment remained decreasing the amount of converter slag as much as possible. Kimitsu Steelworks' technique of using lime slag to dephosphorize has been put into production; KRUPP of West Germany has also industrially tested dephosphorization by spraying soda ash. The pre-dephosphorization method mentioned above cannot be used for molten iron high in phosphorus. Some large steelworks in France do not rely on pre-treatment of molten iron. The process of smelting high-grade steel from high phosphorus iron will be discussed below.

In China, the phosphorus, sulphur and silicon content of molten iron vary greatly among different enterprises. Some of their molten iron contains vanadium, niobium and other paragenetic elements. The molten iron of only a minority of the enterprises is within the scope of regular "steel pig." Therefore, when we study and develop the pre-treatment of molten iron, we cannot merely consider pre-treatment itself but must thoroughly study the best (most economic) policy to eliminate (and utilize) these elements according to the specific conditions of specific locations, rationally distribute them among blast furnaces, molten iron pre-treatment, steelmaking, and the post-treatment of molten steel, and undertake corresponding technical research. Only in this way can we produce the most economically rational technology and process.

5. Post-treatment of molten steel

The other way to lower the metallurgical load of steel-smelting furnaces in order to improve their production capability is post-treatment of molten steel. Molten steel post-treatment can achieve numerous different goals: de-airing, deoxidation, decarbonization, desulphurization, dephosphorization, fine adjustment of composition and temperature, elimination of impurities and changing the state of impurities.

The principal means of de-airing (hydrogen, nitrogen) treatment is vacuum and or blowing or argon. Vacuum treatment can also bring about the deoxidation of carbon or decarbonization of oxygen. Vacuum treatment and blowing of argon are the most extensively used techniques in the post-treatment of molten steel.

The next method is desulphurization. Using argon carrier gas and spraying desulphurizer (primarily silico-calcium alloys today) can lower the sulphur content to under 0.004 percent and can cause residue impurities to change into a less harmful state. Many units are studying the use of lime dust as substitute for silico-calcium alloys.

The degree of desulphurization of the West German MPE method is slightly poorer (below 0.008 percent) but it does not require special installations. Its key points are tapping without slag, blowing argon during tapping, adding small lumps of lime, fluorite and aluminum, and then blowing for several more minutes after covering. Tangible results have also been achieved in desulphurization at the Anshan Iron and Steel Works which uses a similar method.

In terms of the principles of chemistry, the oxygen level of molten iron is lower than that of molten steel, which is more advantageous for desulphurization so that pre-desulphurization of molten iron appears to be more rational than post-desulphurization of molten steel. But the scrap steel and slag material added in the course of steelmaking bring some of the sulphur so that for certain steel varieties even if the molten iron is highly desulphurized it cannot assure that sulphur content of steel will be up to standard and the molten steel still needs to be desulphurized. In short, blast furnaces, pretreatment, steel-smelting furnaces, post-treatment can all achieve different degrees of desulphurization. The principle of desulphurization and the specific methods to be used by the iron and steel works must be based on the conditions of raw materials, makeup of products, production capabilities and investment conditions, and are determined after careful accounting and scientific research. Conditions are similar for dephosphorization (see below) and the recovery and utilization of paragenetic elements.

Alkaline steel-smelting furnaces are basically highly capable of dephosphorization, but when used for the production of steel varieties with high phosphorus molten iron as the raw material and or for the production of varieties with very low phosphorus content, special technical measures must be used in order to ensure it. A good example is the many iron and steel works in northeastern France which use high phosphorus molten iron in raw material and which use large numbers of converters (including LBE, DBM, LMS)--ladle steel-smelting furnances --continuous casting process. In order to give full play to the dephosphorizing capability of converters, they maintain the tapping temperature at the same level as mold casting. To prevent return of phosphorus (slag contains 15-20 percent of P_2O_5), a bottom operation to pour ladles and separate slag is added after tapping. The molten steel temperature required by continuous casting is attained by relying on an arc temperature rising ladle steel-smelting furnace, and vacuum treatment can also be performed if necessary. Those plants do not rely on dephosphorization of molten iron and they mass produce all varieties of steel including those of super-low phosphorus content ($\leqq$ 50 ppm). Reportedly, all ladle steel-smelting furnaces in France are built for this process. It is worth pointing out that in this process the safeguard of low phosphorus content by ladle steel-smelting furnaces is a necessary measure. These furnaces themselves do not dephosphorize but create conditions so that the converters can give full play to their dephosphorizing capability. As for steel varieties whose phosphorus content is particularly low, Sollac Steelworks adds some soda ash prior to the tapping of LWS, and tapping comes after half a minute, which helps dephosphorization.

For certain steel varieties particularly those that are high in elements easy to oxidize, it is feasible to conduct direct dephosphorization outside the furnace after the addition of calcium or calcium alloys to form Ca_3P_2.

It is evident from the above that research to develop new techniques and technology for iron and steel production are very active both inside and outside China. Moreover, the projects are diverse in substance and are interrelated and intertwined. This is because the economic and technological conditions among different countries, regions and enterprises have a general character but they also vary greatly and the methods of solving problems are also different. Each of our tasks must have clearly-defined goals and must be performed and directed at specific conditions and goals. We must use economic results as the criterion from start to finish and never one-sidedly pursue any particular technical target but must give consideration to economic results for the whole enterprise and the entire production process. This requires our workers in science and technology to have a comprehensive field of vision and be good at mutual cooperation. In this way we will be able to make significant contribution to the four modernizations of the motherland.

FOREIGN TRADE AND INVESTMENT

$5.4 BILLION IN FOREIGN CAPITAL ABSORBED SINCE 1979

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 26 Nov 85 p 1

[Article by Zhuang Nuo [8369 6179]: "China Has Absorbed $5.4 Billion in Foreign Capital Since 1979"]

[Text] Shi Lin [4258 2651], adviser to the Ministry of Foreign Economic Relations and Trade, disclosed in Xiamen today that in the 6 years since 1979, China has effectively absorbed almost $5.4 billion in foreign capital.

Shi Lin made the above disclosure to members of the Chinese and foreign economic communities at the opening ceremony of the Fujian investment promotion conference jointly sponsored by the Fujian provincial people's government and the Industrial Development Organization of the United Nations. He said, "In the last 6 years, China has made rapid progress in its drive to attract direct foreign investments. As of this September, China has signed a total of 7,030 contracts with foreign investors, with a combined value of $14.7 billion in foreign capital."

It is understood that among these projects are 1,897 Chinese-foreign joint ventures, 3,408 cooperative enterprises, 109 wholly owned foreign enterprises, 31 cooperation projects in off-shore oil exploration and 1,585 compensatory trade projects.

Statistics from last January through September show further progress in China's effort to attract foreign capital. Altogether 2,197 contracts were signed, with the amount of foreign investments reaching $4.1 billion, of which over $1.1 billion have been invested.

Referring to the adoption of policies to encourage foreign investment and the formulation and perfection of laws and regulations to govern foreign economic relations and trade, Shi Lin said that so far China has promulgated over 50 specific pieces of legislation and signed investment protection agreements with 11 nations and concluded agreements with 5 nations aimed at avoiding double taxation. Other agreements are under negotiation.

CITIC INVOLVED IN 39 JOINT VENTURES, INCLUDING U.S. TIMBER

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 16 Dec 85 p 3

[Article by Ji Hong [character illegible] [6060 3126]: "CITIC Expanding Its Operations"]

[Text] With 39 Chinese-foreign joint ventures and 3 umbrella-type joint ventures under its name, the latter set up as an experiment this year, the China International Trust and Investment Corp [CITIC] has taken another big step forward. This was disclosed at the corporation's sixth board meeting on the 14th.

The 39 Chinese-foreign joint ventures under the corporation can be found in such industries as metallurgy, coal, machinery, textile, food and light industry.

The three umbrella-type joint ventures launched by the corporation this year on a trial basis are also known as control-stock companies internationally. The CITIC is responsible for their overall investment planning and balancing foreign exchange income and expenses.

Last year the CITIC bought several tracts of timberland in the U.S. and Southeast Asia and set up joint ventures to take charge of felling and transportation. The timber from these tracts has successively been shipped to China.

The leasing system under the corporation -- the China Leasing Co, China Oriental Leasing Co and the leasing office of its banking section -- organized a total of about 700 projects in 1984-85 and is graduating from the position of a lessee to that of lessor.

To raise foreign capital, the corporation has been issuing bonds repeatedly in Japan, Hong Kong and the Federal Republic of Germany, and is expected to do so again in Japan soon. With the approval of the People's Bank of China, the banking section of the CITIC began accepting deposits in foreign currencies and the renminbi and offering export credit services on 14th.

Vice Premier Yao Yilin [1202 0181 2651] attended the board meeting and delivered the keynote speech.

FOREIGN TRADE AND INVESTMENT

RECORD CEREAL, OIL, FOODSTUFF EXPORTS EXPECTED IN 1985

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 10 Dec 85 p 1

[Article by Feng Xiao [7458 7197]: "China's Cereal, Oil and Foodstuff Exports Expected To Be the Highest Ever"]

[Text] "China's cereal, oil and foodstuff exports this year are expected to exceed state targets and reach a historic high. Within approved limits, exports have been a profitable foreign exchange earner and produced good economic results." This was disclosed by Cao Wantong [2580 8001 6639], general manager of the China National Cereals, Oils and Foodstuffs Import and Export Corporation, during an interview with reporters yesterday.

Cao Wantong said that cereal, oil and foodstuff exports this year are expected to be 106 percent of the target, up 1.2 percent over last year, the highest level ever. If we include commodities such as aquacultural products, foodstuffs, beer and mineral water, the management of which has been delegated to local authorities, the actual exports will grow by 3.4 percent over last year. Export value will increase by 17.5 percent over 1984 while export losses are expected to be substantially smaller than predicted. Foreign exchange income for the state will grow by $470 million.

Looking at the major export categories, most of the increase in exports occurred in the cereal and oil categories. Foodstuff export this year has dropped when compared to last year. Cereal and oil exports this year account for 47 percent of all foreign exchange income derived from exports, up 8.3 percent over a year earlier. Cereals exports increased 1.1-fold over last year's level to reach an all-time high. Estimates are that we will be able to export more cereals this year than we import. Edible oil, peanut oil, sesame seeds, live cattle, live poultry, frozen beef, fruit, canned pork, granulated sugar -- all have registered an increase in export volume this year.

Cao Wantong noted an obvious characteristic concerning the localities which have reached the target, namely, the marked increase in the amount of export handled by numerous localities. Of the dozen or so branch companies under the corporation, more than half managed to reach or exceed the annual target.

Cao Wantong said that the main reason why it has been able to do so well this year is that the entire corporation has consistently and firmly concentrated on export and taken a variety of effective measures to pinpoint the sources of goods and promote sales aggressively. It has adhered to the united sales policy to cut losses, at the same time cultivating good customer relations, stabilizing the market and building up clients' confidence.

He also said that new efforts would be made in the coming year to develop new products and vigorously open up new markets. To expand export, we must also do a good job in processing with imported materials, turnover trade, compensation trade and third country trade. We should do everything we can to succeed in foreign trade.

JAPAN, PRC TECHNICAL COOPERATION DISCUSSED

Tianjin KEXUEXUE YU KEXUE JISHU GUANLI [SCIENTIOLOGY AND MANAGEMENT OF S&T] in Chinese No 2, 1986 pp 4-6

[Article by Masaru Saito, professor, Chuo University, Japan: "On Technical Cooperation between Japan and China"]

[Text] I. Chinese Technological Strategy

At present, China is heavily engaged in the development of the focal point of its four modernizations. In its strategy to introduce foreign capital, China has strenuously studied the experience of other countries and adopted policies most favorable to China such as various policies about modernization, advanced industrial systems, and management and technology transfers which have nearly all been adopted. However, the focal points are still on the following aspects: 1) transplanting new industries; 2) strengthening management and technology transfers; and 3) doing its best to acquire better results for the four modernizations.

At present, China is trying, through various ways and means, to achieve technology transfers from foreign countries which concentrate not only on the "hardware" but on the "software" as well; they are not only introducing engineering technology but are also interested in the technology of management. They have corrected their shortcoming in the past of looking down on management and are striving to introduce enterprise management from the developed countries under the economic conditions of the free market.

From now on, the focal points of the Chinese technological strategy are: 1) to strive for the development and application of advanced technology in order to serve important areas of national construction. 2) To strengthen technological innovation and create a better structure for industry. 3) To strengthen the introduction, development, and computer technology. 4) To hasten the reform of economic and technology systems and their internationalization. 5) Considering the stage of technological development in China, technology transfers in addition to development based on self-reliance, are still crucial. The really necessary "four transfers" advocated by the Chinese government, which include science and technology transfers, must be carried out from foreign countries to China, from military to civil application, from coastal areas toward the inland, and from laboratories to the site of production. However, there exist many problems in their realization. 6) In order to put the transferred technology into production, cultivation of talent is also one of the strategies adopted by China at present.

II. Structure of Technology Transfer

In the past few years, the Chinese technology transfer market has been expanding rapidly and according to various patterns. In addition to trade, foreign investment, and technology cooperation, various routes of technology transfer have been opened. For example, the number of technology delegations and the people sent abroad for long- and short-term study increases year after year and this increase has occurred on a nongovernmental basis.

Now, there are graduate students in the big, medium-size, and small enterprises in Japan, and among the countries which have technological cooperation with Japan, China has the greatest participation.

China has introduced a great number of complete sets of equipment, such as complete sets of chemical engineering equipment in Shanghai, Zhejiang, and Tianjin; complete sets of thin-film manufacturing equipment in Gansu, Shanghai, and Tianjin; and complete sets of television set manufacturing equipment. In the technology trade in 1983, Japan has 41 percent of the total amount of the technology introduced into China, the United States has 30 percent, West Germany 9.5 percent, and Italy 6.5 percent.

The characteristics of the market of introducing technology into China are these: 1) speaking in terms of region, the large cities are the focal points and most of the technology introduced is concentrated in Shanghai, Tianjin, Beijing, and the Shenzhen Special Economic Zone; 2) in technology introduction, expenditures on "software" are mounting; and 3) the demand for high technology is increasing.

In addition, various kinds of high technology have been introduced through trade. It is said that the list of the Chinese delegations shopping for technical equipment abroad also includes: 1) satellite navigation systems; 2) tracking radar and laser range finders; 3) night vision equipment; 4) military vehicle simulators; 5) giant lathes for large-caliber cannons; and 7) though the introduction of technology for medium-size and small enterprises is vigorously advocated, the proportion of introduction into large enterprises and military technology has been greatest.

In addition to licensing, China has also introduced a large amount of technology through the purchase of machinery and complete sets of equipment. The major countries exporting technology in China in 1983 are Japan (25.9 percent, occupying first place), the United States (13.0 percent), Hong Kong (8.0 percent), Canada (7.5 percent), and East Germany (5.7 percent). From now on, Japan and the United States may become the center, and the introduction of technology from the developed Western countries will increase with the emphasis on introducing industrial technology from Japan and military and aircraft-related technology from the United States.

Japan ocupies the first place in almost every aspect of technology transfer to China. In particular, Japan has accepted a great number of Chinese graduates majoring in various areas of technology. Even as analysis of the history of technology transfer to China up until now would produce the conclusion that China is in the climax of technology introduction.

Technology transfer from Japan has involved a wide range of technology in agriculture, and also other areas, such as industrial measuring-instrument technology, special natural gas valve manufacturing technology, electron microscope manufacturing technology, air compressor manufacturing technology, and industrial sewing machines. Medium-size and small enterprise technology introduction has also increased rapidly.

Looking at strategy, technology transfer requires the mutual efforts of technical personnel from both sides and that requires a better mutual understanding.

III. Strategies of Technology Introduction

The strategy of technology introduction in China is first to make choices in technology based on the overall strategy and then to introduce certain technologies according to the plan. The characteristics of Chinese strategy in the introduction of technology related to people's livelihood are to attract technology to the country and to wait for the opportunity of international technology exhibitions to bring the practical technology into China after the acquisition of all the information, after which the discussions and transactions will proceed. The key to the discussions and the conclusion of transactions is completely determined by negotiations, and there is a substantial difference compared with practices in the developed capitalist countries.

In the procedure of technology introduction, China has first chosen urgently needed suitable technology and has carried out discussions with the companies related to that technology transfer. China also attracted tangible technology into the country through international technology exhibitions. In the discussion and the conclusion of transactions, the Chinese usually adopt a triangular negotiation pattern, which means to negotiate with both the company from which the technology is expected to be transferred and some other foriegn company, that is, to open discussions among the foreign enterprises transferring that technology. The discussion item by item and category by category and the parts which can be locally manufactured are excluded from the discussion. People who attend the discussions are technical experts, experts in commercial affairs, financial experts, and legal experts, and through the coordination of these experts, they attack on many levels to increase their negotiating strength.

The experts on commercial affairs and the legal experts have carefully studied the "Charter of Activiites on Technology Transfer" of the United Nations and they are masters of the laws of industrial ownership. In the last few years, Chinese professional teaching materials on technology introduction have increased day by day.

According to the regulation of the policy published in 1979, articles which can be manufactured in the country will not be introduced regardless of price. In the introduction of complete sets of equipment, those which can be manufactured in China must be excluded; redundancy must be avoided; and the countries or enterprises will be chosen where parts, components, and raw and processed materials can be reasonably supplied. The stipulation mentioned above is a technology introduction policy based on technology transfer, and that technology transfer will in the long run be beneficial to the vigorous development of the country.

Technology introduction, in addition to patents, also includes the introduction of new mechanical equipment and foreign companies can proceed in the manner of investment. Therefore, these points can also be taken into consideration.

IV. Sino-Japanese Technological Cooperation

China, before the implementation of the open-door policy, received little economic and technolog cooperation from the West. The acceptance of cooperation without compensation began in 1981. Cooperation with compensation for the sake of realizing the open-door policy cannot be expanded without considering the ability to pay. The value of technological cooperation reached its climax in 1981; since then the change has been small. In general in cooperation without compensation, a big project is the Sino-Japanese hospital (completed in 1984). In addition, the construction work on the Beijing Post and Telecommunications Training Center and on the Chinese Meat Foods Multiple-research Center is continuing. The focal ponts in cooperation with compensation are items of basic construction such as railroads, harbors and dams, and telephones.

In technological cooperation, the number of graduate students and professionals sent abroad and the number of engineering projects involving technological cooperation are increasing rapidly. Of the foreign countries helped by Japan, China has been number one since 1982; however, counting in terms of the average population helped by Japan, China is still last.

The developed countries entered the Chinese market through the centers of coastal cities such as Beijing, Tianjin, Shanghai, and Guangzhou. Manchuria is the place of principal resources and an area of heavy industry in the north, though the developed countries felt that the level of technological cooperation there was not enough.

China has been emphasizing agriculture. Therefore, it has achieved very good results in the development of agriculture. In industry, China as well as other socialist countries stressed the development of heavy industry. Thus the development of light industry and medium-size and small enterprises slowed. At present, China is striving for the development of medium-size and small enterprises and their modernization to maintain the development of heavy industry, strengthen the flexibility and adaptability of the national economy, and stimulate the vitality of the enterprises.

V. Problems of Technological Cooperation

China is a socialist nation. Therefore, both the selection of the graduate students sent abroad and their work assignments can be done according to the plan. The medium-size and small enterprises in Japan accept a great number of graduage students each year but provide mainly on-the-job-training and are not professional training organizations. The students work very hard, yet the results of their study are low. Since there are more than 20,000 Chinese graudate students sent to our country each year, we had better adopt a more systematic method to do it. And this is consistent with the direction of "education cooperation" flourishing in Japan.

China is walking along the road of socialism, and maintaining independence, and keeping the initiative in its own hands, which contrasts sharply to the capitalist market of free competition. Though it uses the same techniques, the function and meaning are different. Nevertheless, even the technology from capitalist societies can contribute to the development of socialism. The developed countries in the West and East have blocked technology transfers to the Eastern countries in the name of "Coordinating Committee for Export to Communist Areas." This has been relaxed to a great extent to China in the past few years, yet it has not been abolished and may become strict again.

Chinese patent law was implemented in April 1985. To introduce advanced technology, patent rights must be acknowledged and the technology rightly protected. Proper implementation and observation of the law have a direct influence on the international prestige of a country. As for the suppliers of technology, if the technology is not protected under the law, they will no longer transfer their technology. Whether the Chinese are able to enforce the patent law correctly to provide sufficient protection to the rights of the technology suppliers is one of their great tasks. We can also say that the above understanding will apply the same to the foreign investment law, corporate law, and commercial trade law under formulation now.

In the following article, we will talk about the relation between the "four modernizations" advocated by the Chinese and Sino-Japanese technological cooperation. Military and national defense modernization is included in the four modernizations. For some reasons, Japanese technology cannot cooperate in every aspect of the four modernizations.

Finally, I think that all the developed countries, including Japan, seem to compete for cooperation in the technology transfers to China, yet it is not clear at present whether the introduction of technology into China is for the development of Chinese socialism, which is introverted, or for the joining international (export) competition, which is extroverted. Even if Chinese technology introduction is extroverted, it may not for the developed countries end up in eating one's own bitter fruit (Chinse version [Japanese to Chinese translator's note: that is, the possibility of China's becoming a developed country and competitor), owing to the huge gap in the levels of technology between China and the developed countries, but to the NIC's in Asia and the countries of Southeast Asia, China is very likely to become a competitor. For industrial products of equal quality, especially the production of labor-intensive products, once export becomes possible, their impact on the large countries will be enormous. In case the coordination of shared production ([Japanese to Chinese] translator's note: that is, different countries produce different products) cannot proceed smoothly, it is very likely that trade conflicts will occur between China and the Asian NIC's and the countries in Southeast Asia. If the current Chinese open-door policy continues as it has, in the 1990's Chinese exports of industrial products will increase rapidly.

To solve the above problems and then maintain and accelerate the development in Asia to contribute to the peace of the world, it is necessary to establish, through Chinese economic development and her joining the shared production structure, a healthy interdependent relationship at least in Asia. And Japanese technology transfers must proceed in line with the contribution to that relationship.

FOREIGN TRADE AND INVESTMENT

TRADE, ECONOMIC COOPERATION WITH EASTERN EUROPE EXPAND

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 28 Dec 85 p 3

[Article by Feng Xiuju [7458 4423 5468]: "Overview of Trade with Eastern Europe"]

[Text] The year 1985 saw the fastest growth in economic and trade relations between China and countries in Eastern Europe in the 3 decades since such relations were established, with two-way trade reaching $2.64 billion, according to Minister of Foreign Economic Relations and Trade, Zheng Tuobin [6774 2148 1755].

In an interview with reporters, Zheng Tuobin said that in 1985 China signed long-term trade agreements for the years 1986-1990 with Romania, Yugoslavia, Hungary, the German Democratic Republic [GDR], Poland and Albania. During his recent visit to Czechoslovakia and Bulgaria, Vice Premier Li Peng [2621 7720] also concluded long-term trade accords with the host countries.

As Zheng Tuobin sees it, the conclusion of those agreements signal the beginning of a new stage of long-term and stable development in Chinese-Eastern Europe trade and economic relations. It is estimated that bilateral trade under the new long-term trade agreements will increase significantly over that under the trade agreements for the last 5 years.

During the past few years, China's friendly and cooperative relations with Romania and Yugoslavia have been strengthened constantly. For many years, Romania has been our No 1 trading partner in Eastern Europe. Based on our trade agreement, bilateral trade was worth about $760 million this year. During President Ceausescu's historic visit to China last October, the two sides reached a series of long-term economic accords, further brightening the prospects for bilateral trade and economic and technical cooperation.

Two-way trade between China and Yugoslavia has been expanding every year in recent times, rising to $130 million in 1984, an increase sof 65 percent over 1983, and registering a further gain in 1985 compared to a year earlier.

Our trade ties with Bulgaria, Czechoslovakia, the GDR, Hungary and Poland began in the early 1950's. In recent years our contacts have become more frequent, with a corresponding rise in the ranks of officials who visit one another. We have also set up a number of ministerial-level economic, trade and technical cooperation commissions with them.

Discussing the development of economic relations and trade between China and Eastern Europe, Zheng Tuobin summed up their characteristics as follows:

1. A positive momentum has appeared in trade.

Statistically, Chinese-Polish agreements call for an increase of 180 percent in bilateral trade in 1985 over 1984. Corresponding figures for our trade with Hungary, the GDR and Czechoslovakia are 170 percent, 54.5 percent and 39.6 percent, respectively. Chinese-Hungarian trade has also gone up.

2. Changing export and import mixes.

As the economies of both sides mature and as industrial and technical standards improve, the composition of our exports and imports, along with that of Eastern European exports and imports, has been changing to various degrees. In the 1950's, for instance, Chinese imports from Hungary were dominated by complete sets of equipment and electrical machinery products, while our exports comprised mainly grain, edible oil, food and mineral products. After the 1970's, we increased our import of raw materials, semi-processed goods and market products from Hungary and reduced that of complete sets of equipment. Meanwhile, we exported to that nation more and more light industrial and textile goods and less and less mineral products, and began selling it machinery as well. Such changes in the import-export mix help satisfy each other's needs better and promote bilateral trade.

3. A good start has been made in economic and technical cooperation.

During the past year or so, apart from conducting regular trade, the two sides have actively been exploring and opening up new areas and methods of cooperation such as joint production, technical import, the technical modernization of old plants and cooperation in a third nation.

China and Poland have reached agreement this year to cooperate in a number of projects involving the technical modernization of the toffee, bread and cast stone production industries. We are discussing with Hungary cooperation projects in the manufacture of buses, light sockets and light bulk production lines. With the GDR, Czechoslovakia and Bulgaria,too, we have signed a number of contracts on technical modernization projects. Banks and corresponding units on both sides have stepped up direct contacts and business cooperation continuously.

Zheng Tuobin said that all this shows that provided both sides make a concerted effort, Chinese-Eastern European trade and economic cooperation is full of potential. He welcomed these nations, with their advanced technology and superior products, to cooperate with China. He also expressed the hope that the two sides will open up new fields of cooperation and develop new joint products. We must keep our prices fair, reasonable and competitive and adopt imaginative trade methods to develop cooperation in trade-industry integration and trade-technology integration. The aim is to promote one another's socialist enterprise.

FOREIGN TRADE AND INVESTMENT

BELGIAN LOANS FINANCE CHINESE PROJECTS

Beijing GUOJI SHANGBAO in Chinese 25 Nov 85 p 3

[Text] Each year since 1980, the Belgian government has provided us with 300 million Belgian francs (about $5.5 million) in interest-free loans on very favorable terms: the loans will mature in 30 years, with a grace period of 10 years. In other words, principal repayments begin only in the 11th year.

Over the past 5 years, most of the 1.5 billion Belgian franc-credit has been used to finance the construction of the Yaomeng Electric Station (about 900 million Belgian francs) in Henan and the Bell Telephone project in Shanghai (about 600 Belgian francs).

In 1985 the Belgian government extended to the Chinese government a credit package totalling 1 billion Belgian francs. Of this amount, interest-free loans amount to 300 million Belgian francs and export credits account for the remaining 700 million. This credit package also carries very generous terms: 30 percent of a project must be paid for in interest-free loans and the remaining 70 percent in cash or export credit. Since the value of the 1985 loan package is higher than before, we may consider undertaking larger projects.

This batch of loans is now being processed smoothly with the concerted effort of the Ministry of Foreign Economic Relations and Trade and other relevant agencies. So far three contracts have been signed.

The Beijing Wuxing Brewery has signed a contract worth 225,574,600 Belgian francs with the You Min Bu La Company of Belgium, of which 27,672,380 Belgian francs will be paid for in interest-free loans.

The Shanghai Bell Telephone Equipment Manufacturing Company has signed two contracts with Belgium's Bell Telephone Manufacturing Company, worth a total of 663 million Belgian francs, of which 199 million can be paid for in interest-free loans.

FOREIGN TRADE AND INVESTMENT

ECONOMIC RESULTS, EXPANDED TRADE REQUIRE ATTENTION

Beijing GUOJI MAOYI WENTI [INTERNATIONAL TRADE JOURNAL] in Chinese No 5, Sep-Oct 85 pp 23-27, 22

[Article by Ma Chuandong [7456 0278 2767]: "The Ecological Impact of Foreign Trade"]

[Excerpt] II

As the high-tech revolution gathers momentum and international trade expands, we must develop our foreign trade energetically so that it can further serve the open door policy and invigorate the domestic economy. But even as we go about promoting export trade, we must also sum up experience, adapt ourselves to changes in the international and domestic economic situations, and improve our import and export mix continuously in a way that enhances both ecological and economic results.

A. Since the liberation, particularly since the 3d Plenary Session of the 11th CPC Central Committee, China's foreign trade has scored spectacular achievements. But there remains much room for improvement from the perspective of ecological economics. (1) Our present export mix is an improvement upon what it was in the past, but like its counterparts in many developing nations, it remains heavily dependent on primary products (minerals, agricultural produce, sideline products and special native products.) Although the export of these products is essential if we are to earn foreign exchange to finance the import of advanced technology, equipment and materials, it still places us in the position of having to export extensively the nation's natural resources (especially petroleum and coal). At present mineral products; agricultural produce, sideline products and special native products; and industrial processed goods each account for about one third of the nation's total exports. In other words, two thirds of our exports today still consist of natural resources and related primary products. If this situation continues for long, it will have an adverse impact on the long-term coordinated development of China's ecology and economy. (2) In the course of developing and purchasing products for export, particularly when it purchased some agricultural and sideline products, the state in the past often ignored the unity of the ecological system and singled out certain products for which it paid exceptionally high prices, resulting in structural and functional imbalances in the ecosystem. For instance, the foreign trade sector bought up a large quantity of yellow weasel skin and its by-products, thereby drastically reducing the population of the natural predator of mice. This is an important reason why we are overrun with mice these days. In coastal areas, the foreign trade sector paid such attractive prices for important exports like marten that peasants in coastal fishing counties and villages went in for marten-raising on a large scale and resorted to indiscriminate over-fishing, particularly of young fish. What resulted was not only a competition for fish between man and marten, but also serious damage to the fishery ecosystem in neighboring waters as the people scouted the seas for huge quantities of young fish to satisfy the marten's appetite. (3) There was a time when some of China's traditional agricultural and sideline products and arts and crafts were "flagship exports." But they have become uncompetitive in the world markets owing to declining quality, overly high pesticide contents, lack of variety of color and design, destruction of the agricultural ecological environment, preservation and processing problems, and so on. Chinese tea and fruits used to be very popular in the international market. Years of inattention to the breeding of better varieties and perhaps the destruction of forests have led to a deterioration in their ecosystems and an increase in pests. We had no choice but to fall back on pesticides, which caused tea leaves and fruits to decline in quality and hence in world competitiveness. Today our tea exports are no match for India's and our fruit exports are no match for those of the U.S., Japan and other nations. Such are the adverse effects of the destruction of the ecology on the development of foreign trade.

B. In our effort to improve China's export mix from the standpoint of ecological economic principles, we must pay special attention to the following two points:

1. In seeking to expand agricultural, forestry, fishery and animal husbandry exports and the sales of special native products, we must, on the one hand, consider the demands of the international market and gradually increase exports, and, on the other, take care to protect the quality of the ecosystem. We must take pains to combine organically the large-scale export of these products with the improvement of the quality of the ecological environment.

(1) Priority should be given to the development of agricultural, forestry, fishery and animal husbandry products which both earn handsome foreign exchange and benefit the ecology. Over the past 10 years or so, for instance, the inter-cropping of tung tree and grain in the Huang He and Huai He plains, including provinces like Henan and Shandong, is a good idea which has helped improve the ecology. The paulownia trees grown in the fields can be felled in 10 years and yield excellent timber for export. The Shangqiu area in Henan alone exported 15,000 cubic meters of paulownia timber in 1983. Similar achievements abound across the nation and should be promoted vigorously. What merits special attention is the cultivation of flowers for export, which beautifies the environment as well as being a major foreign exchange earner. All the celebrated flowers grown in China, such as the orchid, peony, Chinese rose, lotus, sweet-scented osmanthus and chrysanthemum, are steeped in history. The international flower market grosses over $10 billion annually. As our flower export is exceedingly small, we should energetically tap our resources in this field and step up export.

(2) There are wildlife and wild plant whose over-exploitation above a certain level generates adverse effects on the ecological balance. The way to increase their export, therefore, must lie in the gradual development of a breeding industry. In southern China, for instance, the decline in the snake population has been largely responsible for the sharp increase in mice. And snake meat and snakeskin are much sought-after in the foreign market. To develop the export of snake meat and snakeskin, we must put an end to the wanton hunting and killing of snakes in the wild and slowly build up a snake breeding industry. With its ample snake resources, the Wuyishan nature preserve in Fujian Province has now established a snake farm to breed snakes, including more than half of the 62 species of wild snakes in the area. At its peak each year the snake farm has a total population of over 10,000. If all our southern provinces follow this example, our snake exports will go up and the snake population can be maintained at a level at which it can keep the rats under control.

(3) We must develop "flagship products" among our exports by making use of our special abundance in valuable agricultural, forestry, animal husbandry and fishery resources and special native products. We are naturally well endowed with the above resources, which are of a high quality and enjoy a strong international reputation. Their export once played an important role in the development of our foreign trade. The "Bohai shrimp" industry, for instance, contributed to the rising national exports. However, many of our priceless resources have also been imported and adopted by other nations and became their "flagship products." One example is the Chinese yangtao fruit which is now grown extensively by New Zealand and other nations for export. We are ecologically well suited to develop Yangtao cultivation and should make a concerted effort along this line.

(4) We should enhance the international competitiveness of a number of our traditional agricultural, forestry, fishery and animal husbandry products by improving their varieties and ecological conditions. Examples are tea and such major export fruits as apples, oranges, tangerines and grapes. At the same time the use of pesticides should be reduced.

2. In seeking to expand the export of industrial and handicraft products, we must work hard to sell more products to more nations in order to earn more foreign exchange to support the nation's economic development, on the one hand, and take care to preserve our mineral resources which are essential to our development but are of a limited quantity, on the other. Furthermore, in export development, we must be careful to reduce and prevent pollution.

(1) We must raise step by step the share of processed industrial products of the nation's overall export mix. Today we already have a considerable industrial processing and production capacity, with such coastal cities as Shanghai, Tianjin, Guangzhou, Qingdao and Dalian gradually emerging as formidable centers in many processing industries and becoming internationally competitive. We are now exporting a substantial quantity of light industrial and textile products, while electrical machinery goods and the shipbuilding industry, in particular, are doing better and better. This is a good beginning of our drive to improve the nation's export mix and gradually do

away with its reliance on minerals and agricultural products. John Naisbitt writes in "Megatrends," "For Third World countries, changing conditions will bring about increased competition with one another for a share of the manufacturing trade. That competition has heated up considerably with the recent emergence of China as a new contender in manufacturing. Until the late 1970's, China aimed to fund its ambitious modernization plans by selling raw materials, primarily oil. But China's leaders have changed their strategy. The Chinese will concentrate instead on light industries -- textiles, baskets, bicycles, radio and television assembly. Production in these industries soared 23 percent during the first half of 1980."[1] To make us more competitive in the international market, therefore, we must go all out to increase the export of industrial goods, including light industrial and textile products, food and electrical machinery. This is of great significance for improving the ecological economic results of foreign trade. Toward this end, we must strongly support those enterprises which satisfy the technical condition to produce competitive "flagship" products, and continuously develop a host of promising new products, including state-of-the-art products in the electronics industry.

(2) To expand foreign trade, it is undoubtedly necessary for us to export certain mineral products, particularly minerals of which we have vast reserves (e.g., coal), in an appropriate way. Nevertheless, we should also make an effort to develop processing industries using these resources, especially petroleum. We must gradually increase the export of refined petroleum products and correspondingly cut back on the export of crude oil. As for rare mineral resources, we must consider the future needs of our quickening industrialization and limit their export in the crude form while stepping up their processing for export.

(3) Even as we develop various machine processing industries, we should make use of the country's bountiful labor resources and our advantage as a major exporter of traditional handicrafts, and continue to develop the export of labor-intensive handicrafts, eg., Suzhou embroidery, Hunan embroidery, woolen embroidery, Sichuan embroidery, jacquard weaving, lace trimmings and all kinds of beautiful straw articles. Known as "smokeless industries," they basically do not cause any pollution and are more competitive internationally than their machine-made counterparts. The expansion of labor export also has great potential for a country like China with its massive labor resources.

C. We should improve our import mix under the guidance of ecological economic principles, paying particular attention to the following three aspects:

1. We must emphasize the import of advanced foreign technology, including equipment and know-how. This is essential to raising China's scientific and technological standard and ecological economic results. Generally speaking, advanced foreign technology and equipment are relatively fuel- and raw material-efficient and produce high-quality products. They also come equipped with complete anti-pollution devices. The appropriate import of such equipment, therefore, speeds up the technical modernization of enterprises and makes possible the rise of a number of technically advanced new enterprises (such as those making color TV sets, for instance). And since they turn out good products, they in effect increase the quantity of processed products we

sell overseas. So the import of advanced technology is bound to touch off a positive circle in which the level of our industry and technology goes up to the benefit of our ecology and economy. Certainly most of what we are buying from abroad right now consists of only intermediate technology in widespread use in other nations; foreign capitalists usually are not ready to sell us technology at the cutting edge, for which we must fall back on our own research efforts. We must be very careful when we import equipment for chemical industrial plants which may discharge highly toxic pollutants, and do our best to protect the environment. As far as possible such plants should not be built in medium-sized and large cities.

2. We should import as appropriate those products which help improve the quality of our environment. A few years ago China bought more than 10 million jin of grains each year, thereby cutting back on state food purchases in certain areas. This made it possible for the localities to fallow their land and let it regain its fertility. The acreage devoted to the cultivation of such cash crops as cotton, sugar crops and oil crops has also been suitably increased. As a result, the agricultural ecology has improved over the past few years and rapid progress has occurred in grain, cotton, oil and sugar production.

The low percentage of forest cover and timber shortages are presently an important part of the tension between the ecology and the economy in China. Hence we should import an appropriate amount of timber and paper pulp and, when the timber supply-demand gap begins to narrow, gradually reduce the number of trees we cut down in order to achieve a balance between annual cutting and annual growth. The import of timber is another sensible policy of promoting ecological economic results through import.

As for natural resources of which we do not have a good deal, eg., iron ore, we should again import appropriately in order to reduce the damage which mining and exploitation can do to the environment and speed up the development of our iron and steel industry.

3. We must aggressively develop industrial processing with imported raw materials and the export of processed goods. This is an important way of exploiting our abundant labor resources and our numerous opened coastal cities. In recent years, through such flexible trading methods as processing with foreign materials in accordance with foreign designs and assembling using foreign parts, we have earned a considerable amount of income. In the future, provided we take this kind of operations seriously, particularly in special economic zones like Shenzhen and the 14 opened coastal cities, we may hope to accelerate our foreign trade and the development of our processing industries, import more advanced equipment, gradually improve the import and export mix and upgrade ecological economic results.

CHINESE-FOREIGN SHIPPING NETWORK EMERGING

Chengde JINGJI XIAOXI [Economic News] in Chinese 23 Nov 85 p 1

[Article by Shu [Unclear] [2579 xxxx]: "China Foreign Trade Shipping Network Emerges; Links Domestic and Foreign Ports Throughout the World"]

[Text] Li Chuntian [2621 2504 3944], general manager of the China Foreign Trade Transport Co and the China Boat Rental Co told this reporter that China's foreign trade reserve and transport capacity is rapidly developing. The Foreign Trade Transport Co presently has a fleet of approximately 1 million tons of oceangoing freighters and an equivalent amount of transport facilities that have established agency relationships with more than 300 ports or inland cities in 140 countries and regions. Thus an international transport network is emerging that is in contact with domestic and foreign ports throughout the world.

Li Chuntian said that the Foreign Trade Transport Co has two companies under it in the United States, the China Transport and China-America Transport Co. Representative offices are in Tokyo, Hamburg, Rotterdam, Antwerp, Hong Kong, New York and elsewhere. In the past 30 years the company has been continuously expanding business. In the early 1970's the first container ship line was begun. Thereafter container transfer stations were set up in 8 Chinese ports. Container transport has actively developed through Soviet Siberia, Europe and international rail lines. Since 1980 it has begun to develop various kinds of "door-to-door" international through transport. In recent years it started "desk-to-desk" express airmail services and cooperation with Korea to use the Korean port of Ch'ongjin as a transfer station. Manchurian export channels have been increased, reducing the pressure on the port of Dalian. A new direct river-ocean transport line to Hong Kong and Japan at the mouth of the Chang Jiang was set up, alleviating pressure on the port of Shanghai.

Based on the future needs of foreign trade development, the Foreign Trade Transport Co will actively create circumstances for increasing transport places in Latin America and Africa.

ACHIEVEMENTS OF OPEN DOOR POLICY IN FUJIAN

Fuzhou FUJIAN RIBAO in Chinese 23 Nov 85 p 1

[Article by Yan Zhenyu 7346 2182 5148] and Li Fanglin [2621 5364 2651]: "Formerly a Closed Economy, Fujian Has Become an Open System"]

[Text] What have 6 years of the open door policy achieved for Fujian, one of the first provinces to adopt "special policies and flexible measures?" This is a question of much interest to people at home and abroad. Recently, in particular, localities have been launching a campaign to educate the public about current affairs and public policy and the open door policy is on everybody's lips. We all want to understand it better. It was with the above question in mind that we went to interview Vice Chairman Wei Lisheng [7614 5408 3932] of the Fujian Foreign Economic Relations and Trade Commission a few days ago.

A Multi-level, Multifarious And Multi-functional Open System Now In Place

"The open door policy has injected new vitality our into province's economic development. Right now Fujian is marching toward the world. From a closed economy, it is developing into an open one. The open door policy has achieved gratifying results." Wei Lisheng first told us his general impression of the open door situation in Fujian.

He said, "In 1979, our province began adopting special policies and flexible measures in external economic activities. In 1980, the State Council approved the establishment of the Xiamen Special Economic Zone [SEZ] and further approved the expansion of the limits of the Xiamen SEZ to the entire island in 1983. In 1984, it made Fuzhou one of the opened coastal port cities and authorized the establishment of an economic and technical development zone at Mawei. In early 1985, it approved the designation of 11 counties and municipalities in the Xiamen-Zhangzhou-Quanzhou triangle as a coastal economic development zone. The open door policy in Fujian now manifests itself in four ways: the Xiamen SEZ, the opened city of Fuzhou, the economic and technical development zone in Fuzhou and the economic development zone in the Xiamen-Zhangzhou-Quanzhou triangle in southern Fujian, forming a multi-level, multifarious and multi-functional coastal open economic system that stretches from Fuzhou to Dongshan. The open door policy is entering a new development stage. Six years' experience tells us that the policy has not only promoted the province's foreign economic relations and trade, but also propelled the development of the entire national economy and society. Its effects are becoming more and more evident."

An Outstanding Record In Capital Construction

Wei Lisheng said, "By stepping up capital construction, we have considerably improved the investment climate in the province in recent years." We mentioned the strong impression we obtained when we came into contact with foreign businessmen in the course of covering stories and events. He said, "Yes, improvements in the infrastructure and investment climate are one outstanding achievement of Fujian's open door policy."

He said, "For historical reasons, Fujian languished in poverty, backwardness and isolation for years. Our energy, transportation and telecommunications sectors, in particular, were so underdeveloped that they limited developments in agricultural and industrial production. A few years ago, foreign investors in Fujian joked about being 'exiled' here. To change this situation in the shortest time possible, we have in recent years used foreign capital and local funds to improve such infrastructural facilities and services as energy, communications and telecommunications and continuously tried to perfect the investment climate and conditions. Over the past 6 years, we have essentially been involved in 10 major capital construction projects: building a brand new international airport at Xiamen; expanding the Fuzhou Airport, dredging Mawei harbor in Fuzhou, completing Phase 1 of the Dongdu harbor project in Xiamen, developing program-controlled telephone services in Fuzhou and Xiamen; modernizing the two railroads, the Yingxia line and the Waifu line, expanding the Yongan thermal power plant, and putting up the Shaxikou hydropower station. Nowadays, there are wide-body passenger airliners linking Fuzhou and Xiamen with Beijing, Shanghai, Guangzhou, Hong Kong, Nagasaki and Manila. The construction of 10,000-ton deep-water berths in Fuzhou and Xiamen has been completed. The two program-controlled telephone networks in Fuzhou and Xiamen are the first modern telecommunications facilities to be put into service on the entire Chinese mainland, providing direct-dial access to major Chinese cities, Hong Kong, the U.S. and Japan. The construction of the Shaxikou hydropower station and Zhangping thermal power plant is proceeding round the clock, while the electrification of the two railroads, Yingxia and Waifu, is being stepped up. Tourist facilities, which have attracted friends from all continents, are being improved gradually too. No wonder many foreign friends say, 'It is easier to do business with Fujian now than before.' Others say, 'Visiting Fujian is now less of a hassle than in the past.'"

Fujian Has Absorbed Some Foreign And Overseas Chinese Capital

We asked, "Infrastructural projects have borne early fruits and improved the investment climate, creating the condition for attracting foreign and overseas Chinese capital. How then has the province been faring in this area?"

Wei Lisheng said, "Fujian has kept up a strong momentum in attracting foreign and overseas Chinese capital. The general trend is toward diversification. We are cooperating with more and more units, the channels of cooperation are broadening by the year and there has been a continuous increase in the number of projects and their dollar value. From 1979 to October 1985, the province approved a total of 828 foreign contracts involving $750 million in foreign capital, of which $230 million has actually been invested. Late 1984 figures show that when converted into renminbi, foreign capital which has actually been spent was roughly equivalent to 9 percent of overall investments in the province during the same period. As of October 1985, 318 Chinese-foreign joint ventures have been set up, along with 322 Chinese-foreign cooperative enterprises and 12 wholly owned foreign enterprises." There are 108 projects to each of which foreign investors have committed at least $1 million. Of these 108 projects, moreover, 19 involve foreign capital exceeding $10 million each. Nations and regions investing in Fujian, formerly limited to Hong Kong, Macao, Japan and Southeast Asia, now number over a dozen, including the U.S., Australia, Kuwait, Jordan, Norway, Sweden, Italy, Spain and Britain. Many international financial organizations have established financial and credit relations with Fujian. The scope of investment has also been widened, from electronics, apparel and tourism to energy, transportation, precision instruments, chemicals and other technology-intensive industries. Most enterprises which have gone into operation have produced good economic results. Geographically, investment has spread from coastal cities and villages with a concentration of overseas Chinese to 18 counties and municipalities in the interior mountainous areas. The use of foreign capital has introduced us to a host of modern managerial experiences as well as advanced foreign technology. Direct foreign investment has broadened the province's tax base and created jobs."

Advanced Technology Has Been Imported And Old Enterprises Modernized

"The import of new technology goes hand in hand with the modernization of old enterprises. It occupies a strategic place in the vitalization of Fujian's economy. How is it coming along?" During our interview, we asked Wei Lisheng about the achievements in this field.

Wei Lisheng said, "The import of technology and equipment in recent years has boosted the technical modernization and progress in all the province's existing enterprises and industries. From 1979 through October 1985, the province imported more than 600 pieces of technology and equipment. They have been instrumental in substantially raising the standard of the production technology and the quality of the enterprises in such industries as electronics, light industry, textiles, foodstuffs, metal works, machinery, chemicals, pharmaceutics, printing and packaging; promoting product succession and remedying whatever weaknesses existent in the industries. Among our imports, some are of the latest international standards of the late 1970's and early 1980's. The technologies of manufacturing contraction film, expandable pipe tobacco, high-frequency electric welding canning, medium-density fiberboard, enamel-insulated wire, low-quantity, high-intensity paper bag paper and color sensitive materials are all the first to be introduced to China and fill a technological void in the nation. Statistically, of the expansion in the province's total industrial output value last year, one third was attributed to improved economic results due to imports. The most outstanding industry is electronics. As of 1984, 51 production lines and assembly lines have been imported, the former to make spare parts and the latter to assemble whole sets of equipment, significantly enhancing the industry's capacity for product renewal and succession. The electronics industry's total output value in 1984 reached 970 million yuan and made Fujian the nation's 6th largest electronics producer, up from the 16th position in 1980. A satisfactory momentum has also appeared in the import of foreign technology in agriculture, forestry, animal husbandry and fishery.

Expanding Foreign Trade And Intensifying International Transactions

Wei Lisheng then told us, "The open door policy has boosted our province's export capacity. The foreign trade situation is most gratifying. We now have trading partners in every continent."

He said, "Since the open door policy was adopted, we have made considerable progress in foreign trade, increased our foreign exchange earnings and improved our ability to make payments in foreign currency. In 1984, our imports and exports totalled $692 million, up 2.4-fold over 1978. The average annual increase rate was 22.4 percent. With exports at $420 million, up 7.4 percent over 1983, we sold more than we bought last year. As of 10 November this year, we have already fulfilled ahead of time all the export tasks assigned by the state, having exported $350 million worth of goods. Our province now trades with over 120 nations and regions in the world. Our exports are diversified and come in all forms and shapes, with endless changes in pattern, color, design and variety. The export values of over 50 commodities are among the nation's highest, including 'Narcissus' canned food, 'Dove' plastic slippers and artistic cloth shoes, 'Sailboat' rosin, 'Litchi' and 'Rooster' mosquito-repellant incense. Products with a local flavor, such as jasmine tea, oolong tea, lotus seeds, white dried bamboo shoots, mushrooms and narcissus, and traditional arts and crafts like bodiless lacquer ware, Shoushan carved stone, lacquer furniture, straw goods and cork painting are all highly esteemed abroad. Then there is the range of new commodities which have already had a promising start. Examples are freshwater eel, sneakers, toys, jewelry, color , granite plate, electrical machinery and instruments, chemical products and such nonmetallic products as crystalline silicon and heavy spar, all with great potential.

"In recent years, we have made a good beginning in contracting for international projects and labor cooperation. How do we interpret the province's progress in this new area of international economic and technical cooperation?"

Wei Lisheng said, "Through a variety of channels and approaches, we have been contracting to build all kinds of projects and engaged in all forms of labor cooperation, in the process expanding international economic cooperation and exchange. From 1980 to the end of 1984, we concluded 177 contracts involving either engineering projects or labor cooperation, with a total price tag of over $46 million. Altogether we have sent out 3,100 men times, most of them sailors, construction workers and personnel in such trades as apparel, toys and electronic assembly, to such nations and regions as Hong Kong, Macao, Japan, the Philippines, Singapore, Bangladesh, Yemen, Iraq, Sierra Leone, and . The projects we have undertaken include the Shuanglong Industrial Building and the Lingnan Industrial Building in Macao. Among our foreign aid projects are a sugar-cane plantation, a sugar refinery and staff housing in Sierra Leone; the Hualimo Hydropower Station, the Beining Friendship Sports Stadium and other construction and installation works in Equatorial Guinea, and medical teams to Senegal and Botswana. In addition, 10 non-trade joint ventures and cooperative enterprises have been set up in Hong Kong, Macao, Bangladesh, Yemen, Thailand and so on."

"Our open door policy has another spectacular achievement, namely, expanding international economic interactions and developing friendly relations with other nations." Wei Lisheng briefed us about Fujian's foreign relations.

He said, "Right now Fujian has economic relations and trades with over 120 nations and regions in all five continents. To consolidate economic links and cooperation between Fujian and Hong Kong, Macao and the rest of the world, the province has established Huamin Co, Ltd in Hong Kong as the general agent for Fujian's enterprises in Hong Kong and Macao. Moreover, the province's Foreign Trade Corporation has set up external trade and economic cooperation offices and enterprises in New York, Tokyo, London, Togo, etc. In 1984 alone, the Fujian branch of the China Council for the Promotion of International Trade invited and received 170 relatively large-scale trade delegations from the U.S., Japan, the Netherlands, Belgium, Singapore and Hong Kong. It has also played host to 13 foreign exhibitions and their 800 participants from overseas and Hong Kong. In recent years, Fujian has established friendship relations with Nagasaki Prefecture in Japan, the state of Tasmania in Australia, and Oregon, U.S. Fuzhou has entered into friendship city relations with Nagasaki and Nara, both in Japan, while Xiamen has done likewise with Cardiff, Britain; Sasebo, Japan; Cebu, the Philippines; and Baltimore, U.S. Economic relations and trade between these friendship cities and prefectures have also been developing continuously, strengthening mutual understanding and goodwill and providing favorable conditions for one another's economic growth.

Training And Educating A Host of Cadres

"Six years of practice in the open door policy have also been excellent education and training for leaders at all levels and the broad ranks of cadres." Wei Lisheng concluded the discussion by noting that the open door policy has not only produced positive political effects and benefited the economy, but is also a windfall ideologically. Released from our own little cocoon, we now look at the world with a broad view. Our vision has been widened, our ideas liberated. We have become more knowledgeable and can now breathe in fresh air. International transactions and activities have made many cadres better-informed and more competent, at the same time nurturing a host of people skilled in international business.

JOINT VENTURES IN GUANGZHOU JOIN ECONOMIC GROUP

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 28 Dec 85 p 3

[Text] The Guangzhou Federation of Industry and Commerce held a reception today to welcome Chinese-foreign joint and cooperative ventures which have joined it as members.

Among the first Chinese-foreign joint and cooperative ventures to join the federation are 16 concerns, including China Hotel, Garden Hotel, Guangdong Guest House, China-Hong Kong Air Conditioning and Electrical Engineering Co, White Cloud Toy Factory and Renren Restaurant. In addition, 35 board chairmen, general managers and deputy general managers from 24 joint and cooperative ventures have joined the federation.

The general manager of Garden Hotel, Mr Lu Bao Jia, a Swede, attended the reception as representative of the enterprises.

Mr Guo Kewei [6753 0668 3634], deputy general manager of China Hotel for the Hong Kong side, told reporters, "I am pleased to be a new member because I will have more opportunities to exchange economic information."

Founded in 1952, the federation is a private economic group made up of enterprises and individuals from industry and commerce. Its functions are to represent the legitimate rights and interests of its members, reflect their opinions and demands to government and provide them with economic information.

The federation currently has over 2,000 members.

SUZHOU, WUXI, CHANGZHOU INCREASE FOREIGN CAPITAL USE

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 28 Dec 85 p 1

[Text] Suzhou, Wuxi and Changzhou, three cities with robust economic prowess, took the first steady step toward opening themselves up to the world in 1985.

During the year, a host of foreign investors came here looking for ideal business partners. The cities, for their part, despatched a string of study missions and economic delegations to Hong Kong, Macao and overseas to introduce to local businesses their agricultural and industrial conditions and attractive investment environments.

Suzhou approved as many as 44 projects involving foreign capital from last January through October, of which over 90 percent are production projects. They are valued at more than $40 million in foreign exchange, almost double the annual total in 1984.

In Wuxi, which has had some experience in foreign capital use a few years back, 20 projects materialized this year involving direct foreign investments, including joint and cooperative ventures. The amount of foreign capital actually spent in 1985 is expected to exceed $10 million, up 15 percent over 1984. The share of foreign capital in the total investments of these projects will increase to 60 percent from 30 percent in 1984.

Changzhou has been stepping up the construction of joint ventures so that they can go into production and yield economic benefits as soon as possible. Of the six Chinese-foreign joint ventures under construction this year, three have been completed and opened for business while construction is expected to end soon on two others.

There is a number of new features regarding the three cities' foreign economic and technical cooperation in 1985. The sources of foreign capital are being broadened, from Hong Kong, Macao and Japan to Western Europe and the U.S. The ways in which foreign capital is put to use have been diversified and refined. Compensation trade, processing and Chinese-foreign joint ventures have now been joined by other mechanisms like cooperative ventures and international leasing. Industries attracting foreign capital, formerly limited to traditional industries like light industry, textiles and silks, have also increased to include commerce and tourism. Foreign capital now finds its way into outlying counties and the villages as well as cities.

Situated in the Chang Jiang delta, Suzhou, Wuxi and Changzhou have a solid agricultural base and a relatively well developed commodity economy. In February 1984, the Chang Jiang delta was designated as an opened coastal economic zone, creating an even more favorable environment for the region's foreign economic cooperation.

GUANGZHOU USES FOREIGN CAPITAL TO IMPROVE SERVICES

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 24 Dec 85 p 3

[Text] Through the use of foreign capital, the commercial and service sector in Guangzhou has overhauled some old enterprises, built new ones and modernized and strengthened service facilities, thus gradually solving the longstanding difficulties of finding hotel accommodation, food and means of transportation in the city.

Guangzhou's commerce and trade are tied to their foreign counterparts in a hundred and one ways. To adapt to the needs of the open door policy, scores of shops and markets have used foreign capital to renovate and remodel themselves and buy modern facilities. Nanfang Building, Friendship Store, Wailun Supplies Co and Huaxia Co, etc., have all been air-conditioned and added supermarkets to their stores. Haizhu Market has imported a number of freezers and recently put up 5 three-dimensional aquariums where a wide range of rare live seafood is displayed for customers' selection. It is now a relatively modern, large-scale general food market with a Guangzhou flavor.

Following renovations financed by foreign capital, six guest houses, including Dongfang, Liuhua and Guangzhou, have become high-class hotels complete with modern facilities. Together with other new luxury hotels like China, White Swan and Garden, they provide close to 1,000 modernly furnished hotel rooms with 2,000 beds. No longer do the 2 million foreign visitors who come to Guangzhou each year have to worry about finding accommodation.

After famous restaurants like Panxi, Dasanyuan and Taotaoju were remodeled in cooperation with Hong Kong investors, the city now boasts 72,000 dining spaces. Not only do its old eateries now wear a brand new look, but also gone are the long queues that one must join in the past in order to buy a meal.

Guangzhou residents have long been plagued by the dearth of means of transportation. This problem too has now been solved by the infusion of foreign capital. According to statistics from relevant departments, there are currently 70 to 80 car-renting units in the city with a combined fleet of over 4,000 cars. All are cooperative ventures involving Hong Kong capital.

Since 1979, Guangzhou has adopted a plethora of methods to develop commercial services in cooperation with Hong Kong investors, including 26 tourist projects with a combined capital of $284.51 million. Priority was given to solving the problems one experienced in finding hotel accommodation, a table in a restaurant and means of transportation in order to meet the demands of the open door policy.

Guangzhou uses foreign capital to provide up-to-the-minute international services so as to improve the operating environment for enterprises. A majority of its hotels and restaurants are fitted with such trendy facilities as video game parlors, bars, bowling alleys and gymnasiums. In the past, there was a lack of recreational facilities in the city. This is now changing gradually, with a substantial improvement in economic results.

SHANDONG TRYING TO IMPROVE EXPORT QUALITY

Jinan DAZHONG RIBAO in Chinese 12 Nov 85 p 2

[Article by Liu Jinzhen [0491 6855 4394], Director, Shandong Import/Export Inspection Bureau: "We Must Maintain Quality First for Exports"]

[Text] The CPC Central Committee's "Proposal" regarding the 7th 5-Year Plan states, "Increasing exports and earning even more foreign exchange is the key to implementing the open policy, using more foreign investment and importing technology." Shandong's foreign trade occupies an important place in China and therefore the task of expanding exports and earning foreign exchange will be more arduous in the future. From the perspective of Shandong's experience in commencing foreign trade, to expand exports and earn more foreign exchange we naturally must start from the export product mix, open the international market and begin export production, and make an accurate strategy that is suited to the needs of the international market and China's national conditions. Yet at the same time we must maintain the policy of quality first for all exports.

In the past year there have been rather great improvements in the quality of Shandong's exports and some changes in the export product mix. When compared with real needs, there is still a lot to be done. For example, some of Shandong's exports have a long history and are staple exports but they do not bring a good price on the international market because of quality, variety, or colors that have not been improved for a long time. The selling price of a good may be only a small fraction of that of another country's goods. The selling prices of some exports is low and the volume falls each year because of backward processing techniques or rough handiwork. Thus it is obvious that there is great potential to expand exports and augment foreign exchange earnings by improving quality. If Shandong's more than 1,500 kinds of exports can reach rather high quality standards as soon as possible they will be strongly competitive on the international market and then foreign exchange earnings will grow. We must work on many aspects to improve product quality. For example, we must use advanced technology, equipment and management methods; improve the technical and management levels of enterprises; set down perfected quality testing procedures and rigorous inspection and supervision systems, etc. Nevertheless the most crucial problem to be solved at present is an ideological one; it is also a problem of understanding quality improvements on the part of enterprise leaders and staff. Although a considerable portion of enterprises know that quality is important, their concept of quality is no longer suited to modern needs and quality standards are backward. For example, there have been great changes in many countries' food product health requirements. The quality requirements for imported food are very strict and there are several score tests. Some enterprises mistakenly believe that their products can be sold as high quality goods and they do not try to renovate or update. Other enterprises are shortsighted. They are happy making money from domestic markets and do not try very hard to improve product quality or enter the international market. The above ways of thinking are great impediments to improving product quality and we should earnestly conquer them. Provided that the enterprise leaders and staff truly pay attention to ideological work, firmly put improvements in product quality in a very prominent place, see that everyone regards product quality as a life and death matter, and aim at the advanced world quality, then even more of Shandong's goods will take on the international market and earn even more foreign exchange for the country during the 7th 5-Year Period.

FOREIGN INVESTMENT MODERNIZES SHANGHAI'S INDUSTRIES

Shanghai WEN HUI BAO in Chinese 2 Nov 85 p 1

[Article by Zhu Guangming [2612 0342 2494] and Xu Qiuliang [6079 4428 4731]: "New Products Emerging in Shanghai"]

[Text] Through the use of foreign capital and the import of advanced technology and management, Shanghai is forging ahead with the technical modernization of its traditional industries. Of the 141 approved Chinese-foreign joint ventures, cooperative ventures and foreign-owned enterprises, about half are in industrial production. A host of "import-substitution" and "export-oriented" enterprises are emerging.

At present foreign investors are in the grip of an ever-rising "investment fever" that has driven multitudes of small and medium-sized enterprises as well as world famous multinational corporations to Shanghai; direct foreign investments in the city have reached about $1.2 billion. Faced with this strong influx of foreign funds, the city's foreign economic relations and trade agencies have been carefully selective in screening foreign applications, stressing the development of joint ventures making a wide range of products including woolen textiles, chemical fibers, automatic equipment, drugs, elevators, plate glass, zinc alloy toys, essence, sneakers, telephone equipment, airline food, automobiles, motorcycles and off-shore oil drilling platforms, etc. About a dozen projects have been put into production turning out products to replace what used to be imported or to be sold overseas. Thus they represent a new way whereby the municipality can save on and earn foreign exchange and open up the international market.

As most of the industrial joint ventures are technology-intensive, they play an exemplary role and definitely help promote technical modernization in their respective industries. Shanghai Volkswagen Co, a joint venture with the Federal Republic of Germany [FRG] to manufacture "Shanghai Sang-ta-na [2718 1044 4780]," is now in production with an annual output of 30,000 cars of an international standard. Not only are these cars an improvement upon the "Shanghai" brand vehicles, but some of them are also exported. The Yaohua-Pilkington Glass Co Ltd, a joint venture with Britain to make float glass; the Shanghai Bell Telephone Equipment Manufacturing Co, a joint venture with

Belgium to make program-controlled telephones; the Shanghai Foxboro Instrument Co., a joint venture with the U.S. to produce automatic meters; and the Shanghai Squibb Pharmaceutical Co, a joint venture to produce antibiotics -- all are in the international forefront in terms of technology and equipment. Some of their products and processes have filled a vacuum in China.

TIANJIN'S HORIZONTAL ECONOMIC LINKS DISCUSSED

Tianjin TIANJIN RIBAO in Chinese 5 Nov 85 p 1

[Text] Guided by the policy of the CPC Central Committee, "Invigorate the economy at home and open the country to the world," Tianjin has made rapid progress in establishing inter-regional horizontal economic links. Formerly simple vertical operations, its economic activities are gradually moving in the direction of inter-regional and inter-industry transactions.

In accordance with the principles of doing what one does best, complementing one another, mutual benefit and joint development, the municipality has established long-term economic cooperation relations with 22 provinces and municipalities in the nation since 1980. Over the past 5 years it has obtained notable achievements through cooperation at various levels, through various channels and in various forms. Projects negotiated by the Economic Cooperation Office of the municipal government alone number 4,200, of which over 700 are joint projects, more than 2,500 involve technical cooperation and 930 involve cooperation in qualified personnel. About 50 percent of these projects have been completed or basically completed. To accommodate the development of the horizontal economy, the municipal government has set up offices in Beijing, Shanghai, Guangzhou and Shenzhen. Meanwhile over 20 provinces and municipalities have also established offices in Tianjin. In addition, the municipal Economic Cooperation Office has set up informationexchange and cooperation relations with 150 units in 28 provinces and municipalities. A horizontal economic network, consisting of both horizontal and vertical channels, is taking shape. To play its role as an urban center, Tianjin has set up over 30 trade centers of all kinds keyed to the nation and put up 427 assorted technical development and consulting service organizations. These concerns have done much to promote the exchange and circulation of commodities and technical achievements. The Economic Cooperation Office alone has imported more than 100 commodities in short supply, with a total value of 1.6 billion yuan. At the same time, the municipality has helped sister municipalities and provinces develop resources, improve product quality, expand export and apply new technology.

The establishment of horizontal economic ties transcending regions, sectors, systems of ownership, cities and villages is a big part of the restructuring of Tianjin's economic system during the "Sixth 5-Year Plan" period. Experience shows that this kind of economic links will become more and more important in the transformation of the city from a closed system to an open, multi-functional urban center.

TIANJIN JOINT VENTURES HELD SUCCESSFULL

Chengde JINGJI XIAOXI [ECONOMIC NEWS] in Chinese 6 Nov 85 p 1

[Text] A Tianjin joint venture manager revealed that both sides are quite satisfied with the economic benefits of joint ventures in Tianjin that stress the foreign exchange balance to ensure that operations are entirely smooth. Some 34 of the existing 36 Tianjin joint ventures are profitable. Only 2 of them had losses, totalling RMB 120,000 yuan in the first one-half of this year. A turn for the better is already visible. It is estimated that deficits can be recovered by year-end.

When starting Chinese-foreign joint ventures the city strictly examines the ventures foreign exchange balance. Ventures that cannot achieve a balance are definitely not approved. Tianjin's main method is to require that goods produced by the enterprise itself are put on the international market and foreign exchange income is directly collected. By guaranteeing the state's revenues and making foreign businessmen's profits easily remitted, both sides are activated. Additional revenues this year are within sight for a coastal shrimp farm cooperative venture between Hong Kong and Tianjin businessmen. The parties involved are discussing turning their cooperative production into a joint venture. This year profits increased for the Jinhua Pan Needle Works, one of the first joint ventures, and goods produced by it entered the international market for the first time. This is the result of joint efforts by both parties. Furthermore, because of budgeted foreign exchange profits that can be distributed each year, the Chinese-French Grape Rice-Wine Co Ltd and the Li Ming Cosmetics Industry Co Ltd completely accept joint ventures. This year they decided not to remit their profits abroad but to make additional investments and expand construction in China.

TIANJIN FOREIGN TRADE CONFERENCE IDENTIFIES PRIORITIES

Tianjin TIANJIN RIBAO in Chinese 17 Nov 85 p 1

[Article by Yue Qingjun [1471 7230 0689]: "Tianjin Foreign Trade Conference Reviews Work"]

[Text] The 4-day Tianjin foreign trade conference, which heard experts, scholars and people actually in foreign trade deliver 10 papers, closed on the 15th. The president of the China Trade Center, Zou Siyi [6760 2448 7328], specially wrote from New York, U.S., putting forward his views and suggestions. After full discussions and deliberations, the conference basically approved the general report for submission to the municipal CPC committee and municipal government. Yang Jingheng [2799 4552 5899], member of the standing committee of the municipal CPC committee, presided over the closing session while Zhang Zhaoruo [1728 2507 5387], chairman of the municipal Foreign Economic Relations and Trade Commission, gave the concluding address.

It is the sense of the conference that foreign trade is a total, comprehensive activity the development of which requires coordination and concerted efforts between all industries, all trades and all sectors. Accordingly, we should highlight the importance of promoting foreign trade vigorously by considering it part of the economic development strategy of a coastal economic urban center and make it a prominent part of economic work.

The conference discussed the following issues:

1. Speed up the training of personnel in international business and trade. We must use a variety of methods, channels and levels to develop personnel skilled in foreign business, paying particular attention to the development of foreign trade strategic decision-makers.

2. Strengthen foreign trade information and consulting services, take market surveying and research seriously and gradually build up and perfect a network where information flows horizontally as well as vertically.

3. Use flexible and diverse methods of trade. Even as we devote ourselves to the expansion of commodity trade, we must try hard to develop technical trade

and promote such non-trade services as project contracting, tourism, ocean shipping and overseas investment, among others.

During the conference Tan Shaowen [6223 4801 2429], deputy secretary of the municipal CPC committee; Yang Jingheng, member of the standing committee of the municipal CPC committee; Li Lanqing [2621 1526 3237], vice mayor; and Zheng Wantong [6774 5502 6639], secretary general of the municipal CPC committee, made a special trip to the guest house to call on out-of-town delegates as well as some local delegates.

ZHEJIANG OFFERS PREFERENTIAL TREATMENT TO INVESTORS

Chengde JINGJI XIAOXI [ECONOMIC NEWS] in Chinese 6 Nov 85 p 1

[Text] At the Zhejiang Foreign Trade Conference Governor Wu Minda [0702 2404 6671] announced to more than 300 foreign businessmen from 16 countries and regions that those who invest in and cooperate with Zhejiang can enjoy the following preferential treatment.

Foreign-investment joint venture, cooperative or foreign-owned enterprises of a productive nature that are opened in the open economic and technical area can be exempt from income taxes and foreign businessmen's share of legal profits can be remitted abroad and shall be exempt from remittance taxes.

With approval, the enterprise income tax of technology- or knowledge-intensive enterprises or projects that have an investment of more than $30 million with a long recovery period that are located in old areas of Ningbo or Wenzhou, or the open economic areas of Jiaxing or Huzhou shall be reduced to 15 percent, and businessmen's profits shall be exempt from remittance taxes.

The income tax shall be reduced to 15 percent for foreign-investment projects in the areas of energy, transportation or harbor construction.

Imported raw materials, parts and personal communications tools and materials for daily use in cooperative or joint ventures or foreign-owned enterprises that produce exports shall be exempt from customs duties and the Consolidated Industrial and Commercial Tax on imports.

Joint or cooperative ventures or foreign-owned enterprises that provide advanced foreign techniques, technology, equipment or goods that can replace imports shall be permitted to sell a certain proportion of their goods in China.

Exports of goods produced in the aforementioned categories (excluding goods prohibited for export by the state) shall be exempt from export duties and the industrial portion of the Consolidated Industrial and Comercial Tax.

IMPORT OF SECOND-HAND EQUIPMENT DISCUSSED

Beijing GUOJI MAOYI WENTI [INTERNATIONAL TRADE JOURNAL] in Chinese No 5, Sep-Oct 85 pp 28-32, 48

[Article by Zhang Jinxi [1728 6651 3886]: "A Preliminary Look at the Import of Secondhand Equipment"]

[Text] There is a need for exploratory research on both the theory and practice of the import of second-hand equipment. As our economy develops rapidly and urban and rural economic reforms become more far-reaching, the import of such equipment will gain increasing prominence. In the past we were more concerned to import advanced technology and equipment per se than technology and equipment suited to China's circumstances and almost ignored the import of second-hand equipment. Only in the last couple of years has this situation changed. It is clearly profoundly significant for the four modernizations that we practically strengthen our leadership over the import of second-hand equipment and intensify our theoretical research on it.

I. The Need For Importing Second-Hand Equipment

The most glaring problem in China's economic development at present is its backward productive forces. And a key method of improving our backward productive forces is developing science and technology. In general there are two approaches to scientific and technological development. First, we can encourage the nation's scientific and technical personnel to innovate, conduct creative research and development [R & D] and promptly apply new scientific and technical achievements to the realm of production, thereby converting science and technology into productive forces. In the second approach, we learn and absorb advanced foreign scientific and technical achievements, carry out imitative R & D and directly apply them to production. Alternatively we may engage in destructive research, such as reverse engineering and, by dismantling a product, explore the characteristics and manufacturing process of its raw and other materials, the processing equipment used in its production, its processing technology and its design process so as to master its entire production technology. Given the present backward state of China's science and technology, the latter approach assumes particular importance and constitutes a shortcut to the development of science and technology. The import of second-hand equipment not only directly provides us with production hardware but also furnishes reverse engineering with inexpensive data.

Of China's 40 million enterprises, a substantial portion operate with outdated equipment and are technically backward. They have an urgent need to modernize their equipment, a task currently beyond our capability: we can only spend our limited foreign exchange on the nation's priority projects. The first problem we encounter in importing advanced foreign technology and equipment to replace the obsolete equipment at home is high prices. Next we run into the problem of our inability to assimilate what we purchase from abroad. High prices effectively limit our purchasing power and the quantity of our purchases, while a failure to assimilate imported equipment or to integrate it into our production setup results in waste. The import of second-hand equipment is a satisfactory solution to both problems; second-hand equipment is inexpensive and easier to assimilate.

II. What Is Secondhand Equipment?

What is second-hand equipment? Some people think it is old equipment or used equipment. Not so. Secondhand equipment includes new as well as old equipment. Old equipment may mean depreciated but usable equipment or depreciated, unusable equipment. It may also mean used but undepreciated equipment which retains some use value. Defined in the last manner, old equipment means the same as used equipment and the two expressions are interchangeable. Secondhand equipment, on the other hand, has a broader meaning. Some second-hand equipment is new equipment. For example, a factory goes broke and is forced to sell off as second-hand equipment the machinery it has ordered and never used during the liquidation proceedings. Some of the equipment on order may has been delivered while some may still be being produced. All this should be included when we consider second-hand equipment. Not only is this equipment entirely new, but it is also inexpensive and ideally suited for direct production once acquired. Some second-hand items which are relatively old are even less expensive and can be used in reverse engineering, a much more economical move than buying brand-new materials and equipment for that purpose. Of course where the project involves the study of state-of-the-art technology, we have no choice but to use the latest products. Sometimes a factory, for a variety of reasons, is forced to part with a piece of equipment it has bought to cut losses. This kind of equipment is also a suitable candidate for second-hand purchases. For example, a Brazilian company has resold to the Beijing Guangda Industrial Company a number of West German trucks, which it had purchased without taking into account the country's equatorial rain forest climate.

Secondhand equipment by and large can be classified in the following ways: by its newness,in which case it can be completely new, relatively new or semi-new; by the scale of the purchase: it can be a single piece of key equipment, a production line, a whole set of equipment or an entire plant; and by the financial status of the seller: the equipment may be put up for sale by a liquidation committee, by a profiteering middleman or by a factory strapped for cash or switching to another line of product.

There is a common tendency to opt for relatively or completely new second-hand equipment. But circumstances differ from case to case; we should decide how old or new a piece of equipment we should buy by analyzing the facts of the case in hand and the uses to which the equipment will be put. As far as the scale of the purchase is concerned, the rule of thumb is to buy a production line rather than a piece of equipment, and to buy an entire plant rather than a production line. This is because if we look at the price of a piece of equipment, the bulk of it is accounted for by the key equipment and main production line, with the accessories costing next to nothing. Say you want to buy the engine of an old ship. Rather than buying just the engine, you would do better by buying the entire ship because the engine often costs as much as the ship. By buying the entire ship, you acquire the ship plate and other accessories.

What is presented above is only a crude classification of second-hand equipment. It gives us a preliminary idea of a subject which is more complex in reality. There is no need to go into detail here.

III. Characteristics Of The Import Of Second-Hand Equipment

The most outstanding feature of importing second-hand equipment is its inexpensiveness.

If its patent period has already expired when we buy a piece of second-hand equipment, and if the seller is the patentee, we will take possession of the patent as well as the equipment. In the West, a patent is usually good for 15 years or more. It is not an infringement of a patent to buy a piece of equipment used for the manufacture of a product covered by an unexpired patent.

Importing second-hand equipment is often a way to get around the export restrictions of foreign governments. There is some equipment which cannot be exported in a brand-new state. If it is second-hand, however, it is not subject to that restriction. Examples are certain equipment which makes military hard-ware and cutting-edge products.

Second-hand equipment is often superior in that it fits China's circumstances, that is, the standard of the country's productive forces. Generally speaking, we should consider the following factors when we import technology and equipment: 1) Does the nation need it urgently? 2) Do we have the funds for it? 3) Is it on the restricted list of a foreign government? 4) Does it reach a definite advanced level? 5) Can we assimilate it? This list is certainly not exhaustive. Of the five factors, the first one is undoubtedly a prerequisite. Both the second and third factors apply to the import of second-hand equipment. We should be particularly mindful of the fourth factor when we import second-hand equipment; we have no use for obsolete equipment which should be eliminated. The last factor is also relevant to second-hand equipment import: often the latest equipment we cannot assimilate while what we do need most is technology and equipment which may not be state-of-the-art but which suits our national conditions best. Since it is inexpensive, we will not balk at discarding or replacing a piece of second-hand equipment after it has served our purpose for some time. With its short life cycle, second-hand equipment fits in nicely with the ever-changing nature of modern science and technology and the versatility of modern production. Large, self-contained equipment which lasts and lasts cannot keep up with the frantic pace of scientific progress today. The contemporary trend is toward small, self-contained industrial structures. To borrow a term from weiqi, the structure should be light and flexible, not unwieldy.

IV. The Possibility Of Importing SecondHand Equipment

The possibility of importing second-hand equipment is in effect a question of exploiting the capitalist economic crisis. We know that economic crises in the capitalist world are cyclical. During a capitalist crisis, large corporations are stuck with surplus capacity and may suspend operations and production, while there is a wave of bankruptcies among small and medium-sized enterprises. This is an excellent opportunity for importing second-hand equipment. In the early 1930's, for instance, the Soviet Union made good use of the Depression in the capitalist world by importing vast quantities of equipment. At the time it was the largest importer of foreign machinery in the world, purchasing one third of total world machinery exports in 1931 and one half in 1932. Only during the Second 5-Year Plan (1933-37) did it cut back on foreign machinery and equipment purchases due to an increase in its own production capacity. Among equipment bought by the USSR, a considerable portion consisted of second-hand equipment, key installations, even entire plants, bought from Western factories which had gone bankrupt. The import of machinery on this massive scale enabled the Soviet economy to grow rapidly and helped lay a solid material foundation for Soviet victory in its anti-fascist struggle during World War II. For instance, the tractor plant it imported during the Depression switched to making tanks during the war. We should learn from the Soviet experience in exploiting the capitalist economic crisis.

Since 1975, the capitalist world has been plagued by stagflation which has not yet run its course. Although the U.S. economy has bounced back fairly strongly in the past 2 years, the recovery may be a temporary phenomenon. With capitalism in the throes of structural readjustment and recession a frequent occurrence, some enterprises will go out of business while others will switch to another line of product, reorganize or merge with another firm. It is an important part of our import of advanced technology and equipment to make use of this situation to make some good second-hand buys.

When recession hits the capitalist world, small and medium-sized enterprises are the first to suffer. And it is the equipment of just these enterprises which is often most suited to the standard of our productive forces and is easier to absorb and assimilate. As it is inexpensive and can be put into production and produces results quickly, it should be what we go after when we import second-hand equipment.

Even when capitalist economies are booming, corporate bankruptcies, closures, mergers and changes in production lines happen frequently. As long as we keep ourselves well informed, opportunities for second-hand purchases are everywhere.

V. Major Links In Second-Hand Equipment Import

The import of second-hand equipment belongs to the realm of the import of technology and equipment. But even though it is similar to the latter as generally defined, it has its own special features resulting from the uniqueness of the second-hand equipment market. The main difference is this. The technology and equipment market as we normally understand it is relatively stable. A buyer can buy off the shelf, so to speak, or place an order. Buying and selling are conducted step by step in accordance with regular procedures; the whole transaction is more susceptible to planning. The second-hand equipment market is radically different in that it changes by the minute. Where and from whom you can buy second-hand equipment is purely accidental and unpredictable. There is a high degree of fortuity about the entire process. This fortuity determines that when we import second-hand equipment, we must come to grips with three important links: information, qualified personnel and the simplification of import procedures. Let's examine them in turn.

(1) Information. The importance of information in international economic intercourse today is self-evident. No information, no deal. Information is of special importance to the import of second-hand equipment. This kind of information is also extremely volatile. Information on the second-hand equipment market can be divided into two kinds, supply and demand. Supply information pertains to the seller and since it originates abroad, we also call it foreign information. Domestic information pertains to the buyer and since it originates at home, we also call it domestic information. Combine these two kinds of information, and you satisfy the minimal condition for a deal.

Foreign information, for one thing, is usually unstable, changeable and highly time-dependent. If we are indecisive, we stand to lose a good opportunity. Once a seller has sold a certain piece of second-hand equipment, we will not be able to buy from him the same kind of equipment. This situation is rather like an auction. Second, this being a big world, suppliers and sellers abound. So we can say foreign information is inexhaustible.

To get hold of foreign information, we need more than second-hand equipment import personnel who keep their eyes and ears open. We must also establish an information network on the second-hand equipment market and seek to understand foreign information through our commercial counsellors' offices, banks, embassies and other Chinese institutions overseas. Study missions are another way of getting to know the second-hand equipment market. Of these methods, researching the second-hand equipment market in the course of regular transactions with Chinese banks overseas and foreign banks is of particular significance. This is because we purchase much of our second-hand equipment from factories going under. For instance, the motorcycle plant imported by the International Trust Investment Company from Germany on behalf of Tianjin was bought from a concern which was going out of business. Under normal circumstances, when an enterprise goes under, a bank steps in to take care of the liquidation proceedings. Banks, therefore, have direct access to information on second-hand equipment market. Another approach is through study missions, which of course does not mean that we must send delegations overseas charged with the special task of studying the market for second-hand equipment. But it does mean including a second-hand equipment investigator in the various study delegations we despatch abroad or appointing a delegate to double as second-hand equipment market investigator. This method provides first-hand data.

The understanding of the market for second-hand equipment should become part of the daily work of our commercial counsellors' offices, banks, embassies and other Chinese institutions overseas for which a specific employee will be held responsible. We must put an end to the lack of involvement by banks in the import of second-hand equipment, something which cannot be accomplished without a circular from the State Council explicitly to that effect. The plethora of Chinese institutions abroad collecting information and channeling it toward the organizations at home which deal with second-hand imports;, these organizations, in turn, forwarding it to domestic users and pulling together domestic and foreign information -- this is information-gathering by key points.

There is also a surface approach to gathering information, which essentially means understanding the foreign second-hand equipment market via middlemen. Middlemen may and may not be overseas Chinese businessmen who, scattered all over the world, are a force in the four modernizations not to be ignored. Through them, we can gain access to an even larger spread of information. By combining the point approach with the surface approach, we can ensure a smooth flow of information, a prerequisite for the import of second-hand equipment.

Domestic information pertains to what domestic users demand. China is a vast country with myriad enterprises, many of which are in desperate need of technical modernization and equipment renewal, so there is also a wealth of domestic information. Compared to foreign information, however, domestic information is of a smaller quantity and also more stable. Collecting domestic information is correspondingly easier. We can send out letters of inquiry or conduct face-to-face talks. The information thus collected can be stored in agencies in charge of second-hand import to form a user information bank available for inspection anytime.

Which should we come to grips with first, foreign or domestic information? There is no hard and fast rule. Generally speaking, we should first zero in on the more straightforward part of a task. Accordingly, we should begin by concentrating on and mastering the domestic demand end, followed by an effort to look for sellers abroad. If we do it the other way round, that is, concentrating on foreign information first and then looking for domestic users, we may not be able to come up with them at short notice and hence let a good opportunity slip by. Of course this does not apply to all cases.

To understand foreign supply information and domestic demand information requires a spirit of full cooperation. Agencies which play a part in providing second-hand equipment information -- commercial counsellors' offices, banks, embassies and other institutions overseas -- belong to different sectors. If they lack a spirit of cooperation for the sake of the four modernizations, our work will come to nothing. Real-life instances abound of cooperation making the difference between success and failure.

To come to grips with foreign information, we must adapt ourselves to its special characteristics of volatility and time-dependency. To get a firm grasp of domestic information, we must do likewise with its characteristics of accuracy and suitability. Full coordination between the gathering of domestic and foreign information is the essence of second-hand equipment information work.

(2) Qualified personnel. Once information is in hand, we still need a host of people with both technical expertise and business skills if we are to use our information well and strike a deal. Without such people, we will have a lot of difficulties. We know from experience that an outstanding foreign trade worker lacking technical or professional competence hesitates to import an item even though he knows it is available because he cannot tell whether it is good or bad. Conversely, the technical expert who knows nothing about foreign trade is at a loss as to how to go about importing foreign equipment. When it comes to actually importing technology and equipment, therefore, we are in effect forced to mobilize both the trade expert and the technician, which often means putting three or more people in the field to tackle one single foreign businessman. The inefficiency of such an approach is obvious and all because our foreign trade personnel know nothing besides foreign trade. Rare are those who have both technical and trade skills. And if they happen to come from different sectors and are answerable to different bosses, cooperation will be even more fraught with difficulty. This happens often in equipment and technology import. Hence the need for a major effort to train foreign trade personnel proficient in technology as well as trade.

(3) The simplification of import procedures. The special quality of the market for second-hand equipment determines that the import of such equipment cannot follow established procedures as rigidly and bureaucratically as conventional technology import. It has no room for buck-passing and step-by-step examination and approval. Personnel in charge of second-hand equipment must have the authority to make on-the-spot decisions, so the simplification of import procedures and the reform of the management system are critical issues in the success of second-hand equipment import. In our experience, it is a sound approach to delegate the implementation of a project to the project manager, give him full power to oversee the whole project from beginning to end and make him answerable to the board of directors.

(4) The pricing of second-hand equipment. Should the price of a piece of second-hand equipment be determined entirely through the bargaining process during negotiation? Not quite. In the case of some old equipment, their prices are decided by their depreciation period and usually hover around the original price minus depreciation. In the U.S., plants, machinery and means of transportation are depreciated in 10, 5 and 3 years respectively. If the seller of the equipment in question is an enterprise going broke, its price usually approximates the amount of debt owned the creditor. As long as the price offered basically pays off the creditor, it will be acceptable to the seller. When a piece of equipment is put up for sale because its owner is strapped for cash, an acceptable price will be one which will put enough cash in the seller's hands to solve his cash flow difficulties. There are other situations in which an enterprise made an ill-considered purchase and has no

choice but to resell it. This kind of seller wants to make good his losses to the greatest extent possible and will be happy provided he can cut his losses. In these cases, prices are determined by negotiation.

To capture the initiative in second-hand equipment price negotiation, we must first have a clear idea of the seller's credit position. Combine this knowledge with negotiating skills and an understanding of his psychology and we can clinch a deal.

(5) One of the characteristics of the demand information of domestic users is that it is clouded with preconceived notions. Some domestic users, for instance, are so convinced of the virtues of a particular product or equipment that they insist on it even though it may be obsolete or is no longer in production. The foreign businessmen benefits from our obsession in two ways: he can unload on us his outdated equipment and makes a handsome profit in the process. This mentality among domestic users, a result of lack of information, militates against our economic development. Japanese merchants, for instance, have shrewdly taken advantage of it and enriched themselves by dumping substandard, outmoded equipment on us. We must give this problem full consideration.

Now and then domestic users also get into a buying stampede and bid up prices, in sharp contrast to our exporters who try to outsell one another by slashing prices. Guangda Company, for instance, imported a set of equipment from the U.S. After they got wind of this purchase, several other users also quoted prices to U.S. firms. In the end, the State Economic Commission was forced to step in and imposed a centralized system. Only then was the import successfully concluded.

As far as China is concerned, the import of second-hand equipment is new territory. The above discussion is essentially a summary of our experience in this novel area. The theoretical aspect is preliminary, exploratory and very immature. The purpose of the article is to elicit more thoughtful ideas and more writings on this topic so that the import of second-hand equipment will be more successful.

CHINESE COLOR TV INDUSTRY ENTERS INTERNATIONAL MARKET

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 16 Dec 85 p 3

[Text] China's color television sets have begun making their way into the international market, according to the WENHUI BAO. Beijing alone exported 20,000 sets of the "Peony" and other brands to Western Europe and Southeast Asia this year, earning $5 million in foreign exchange for the nation. It is learned that China will export TV sets on an extensive scale next year, of which color sets will account for one third.

Currently China has four major color TV set production centers, turning out such well-known brands as "Beijing," "Panda," "Gold Star" and "Peony." On average a Chinese color TV can operate for 15,000 hours without a break-down. Our TV sets have attained the standard of similar products in other parts of the world.

The rapid growth of China's color TV industry can be traced to our import of advanced foreign technology. Since 1980 we have successively imported 70 color TV assembly lines to make complete sets and a number of production lines to make components and accessories, which laid the foundation for our color TV industry. At present the industry is trying to achieve two major strategic shifts: from depending on imported technology to manufacturing complete sets domestically, and from satisfying the domestic market to making our entry into the international market. To that end, the Ministry of Electronics Industry has made plans for the gradual domestication of the TV industry. Beginning next year, the price of Chinese components as a portion of the price of a complete set (excluding the picture tube) will be raised to 70 percent and, in some cases, 80 percent. This must be achieved without lowering the quality of the machine as compared to its imported counterpart. In this way, the amount of foreign exchange spent on each color TV set can be lowered from its present level.

CHEMICAL INDUSTRY BOOSTS EXPORTS

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 24 Dec 85 p 3

[Article by Xing Fengbing [6717 7685 3521]: "Outstanding Export Record for Chemical Industry during the 6th 5-Year Plan"]

[Text] During the "Sixth 5-Year Plan," agencies in chemical industry vigorously promoted the import and export of chemical industrial products and obtained solid achievements in importing technology and equipment, exporting products, bidding for foreign projects and labor cooperation, etc. This was revealed at the national chemical industrial import and export work conference held in Beijing. Preliminary statistics show that chemical industrial imports and exports totaled $19.9 billion during the past 5 years, up 70 percent over the "Fifth 5-Year Plan" period. Chinese chemical industrial exports include organic industrial chemicals, rubber products, dyes and paints, and earn $700 million in foreign exchange each year.

During the "Sixth 5-Year Plan," the chemical industry imported a total of 466 pieces of advanced foreign technology and key equipment at a cost of $750 million. There are several gratifying trends about the imports. First, more and more of them are used to modernize existing enterprises technically. Of the 63 deals made in 1984 alone, 44 involved technical modernization. Second, imports have become more diversified. Instead of buying mostly whole sets of equipment as we did in the past, now we shop for software, design and make hardware in cooperation with other nations, and buy patented technology and key equipment in an all-out effort to save foreign exchange for the country. Third, we now buy from a widening range of nations and regions. Apart from dealing with developed nations like Japan, the U.S. and the Federal Republic of Germany, we have also strengthened cooperation and trade ties with the Third World and nations in Eastern Europe.

NECESSARY CONDITIONS FOR JOINT VENTURES

Tianjin KEXUEXUE YU KEXUE JISHU GUANLI [SCIENTIOLOGY AND MANAGEMENT OF S&T] in Chinese No 2, 1986 pp 6-7

[Article by Keizo Umeda, Himeji Junior College, Hyogo Prefecture, Japan; rewritten by Yong Qian [0516 3677], Zhao Beiwang [6392 054 2598], chief editor: "Necessary Conditions for Joint Ventures"]

[Text] In a world where science and technology progress day by day, it is rather difficult to be outstanding among other competitors; therefore, every enterprise tries to change the structure of its industry and technology and consolidate its position through joint ventures.

However, there are also lots of examples of termination of an agreement of cooperation among the developed countries. At present, the conflicts are acute. In general, joint ventures have the following problems:

1. The items of joint-venture enterprise are more mature, so the introducing country loses the characteristics of being a new producer and also loses the true significance of joint ventures. Thus a joint-venture enterprise can be banned easily by the mother company.

2. Owing to the recession of joint-venture enterprises, their strategies of management must change; otherwise the result will be that the investor country cuts its investment and limits it to a small amount of capital or recalls its total investment. Consequently, the other party revokes the administrative power of the investor.

3. The elimination of obstacles to both parties on the basis of mutual understanding and mutual trust between the two partners not only in appearance and formality but also in an honest and sincere exchange of opinions and management.

4. In case difficulties or problems in management emerge in the mother company, the contract is cancelled and the enterprise is managed independently by a single party.

Therefore, it is necessary to summarize conscientiously the causes of failure of joint-venture enterprises and pursue the ways and means of success and improvement.

Sources from multinational enterprises in Europe and Japanese enterprises abroad reveal that the causes of failure of joint-venture enterprises can be summed up as follows: incomplete market research and inadequate investigation within the enterprise, poor management by the mother company, and a change in foreign investment from the mother company.

The causes of failure from the local society include inconsistency of opinions with the [mother?] company and external causes, mainly from an economy that is overproducing. To avoid the above-mentioned occurrences, the key is to maintain harmony with the local enterprises and collect information from the client countries to become mutually prepared; select the places for local investment, analyze the characteristics of the products and the competitive situation, predict the buying power of the joint-venture enterprise, and determine the purchasing price, conditions, and commercial customs, according to the size of the market; and analyze, through the cycle and according to the cost of transportation, the conditions for production equipment, materials, regulations about the social effects of pollution, and labor in order to explore the productivity of the enterprise, the tax system, capital transfers, and the budget. The most important among the conditions mentioned above is how to make a selection. It affects whether the enterprise can be successful or not. Besides, it is necessary to study further the culture and history of the host country in order to communicate for the joint-venture enterprise and eliminate misunderstandings. Also attention must be paid to the distribution of authority. It is necessary to conduct technology transfers and develop new technology on a broad scope from manufacturing and processing to management.

In technology transfers, it is important to introduce new technology; however, it is even more important to develop new technology. If new technology is developed, there will be room in both the developed and the developing countries for technology transfers. Modern multinational enterprises do not rely on capital or ownership but pay attention to the distribution of production in order to enhance the cooperation between East and West.

Nevertheless, the essence of joint-venture enterprises is to enable the partners to draw on the strengths of each to offset the weaknesses of the other to maintain the cooperative system. Once mutual trust is established among the partners, it is necessary to overcome any difficulties; otherwise, that organization is bound to collapse, no matter what it is. This is what we should always remember.

But in the past few years, the international investment environment has changed and some new problems need to be solved urgently. As we saw in Iran, even in a so-called stable market and host country, with revolution, internal disorder, and war and with the ending danger of a termination of the projects in progress and a takeover of capital before fulfillment of the contract, the future situation can be hard to imagine. Countries with an accumulated debt include most developing countries striving to carry out their economic policies but these countries are still thought to be the most promising countries as host countries for investment. However, because of the accumulated debts, the profit received by the host country is greatly limited and, as a result, the reinvestment of that profit in the host country by the investor is limited.

Thus, there are strategic measures such as the signing of an investment protection agreement between the investor and host countries in order to lessen or minimize the investment danger.

In China there are in general many achievements in the acceptance of foreign investment, but the following problems still exist: 1) there is more cooperation based on an agreement but few on joint venture; 2) more capital comes from Hong Kong and Macao compatriots and little comes from foreign enterprises, or consortiums; 3) there are more medium-size and small items but few large ones; 4) there is more investments in tertiary industries but little in manufacture for export; 5) in intended investments which have been revealed, there are more items which require longer terms of negotiation while few eventually arrive at a satisfactory conclusion; 6) the amount of investment stipulated in the contract is high while the actual investment is low; 7) more foreign investment is introducted but foriegn exchange created with the foreign investment is little.

In joint-venture enterprises with investment from Japan, from basic enterprises to enterprises representing a great volume of trade, and if underwater operations are included, along with the increase in the number of joint-venture enterprises, the kinds of the enterprises have also expanded in many aspects, from the servicing and manufacture of motors or generators and fiber products to the manufacture of automobiles.

The reasons for the rapid growth in Sino-Japanese joint ventures are, first, because China has made great efforts to expand favorable treatment and enhance the law. However, the problems caused by the increase of joint-venture enterprises have become cleared. The main problems are the following: now, in the joint venture, the most troublesome thing for the Japanese party is the pricing of land and the second is the insufficiency of transportation at the harbors, which affects exports. Therefore, the harbors need to be reorganized and enhanced and new ones built. Third, people do not quite trust the supply of energy and raw materials. Though the supply of energy and raw materials for joint-venture enterprises has priority, severe energy shortages in the country exist, especially in electricity, and when joint-venture enterprises increase later on, the stable supply of electricity in some places may experience some difficulties. Fourth, the sovereignty of labor enterprises, yet the enterprises can only recruit workers in the suburbs; they hope to recruit the finest workers in an wider area but there exist difficulties in applications for residence in the municipalities. Furthermore, wages tend to rise, especially when there is a shortage of people who can speak foreign languages, and their wage increases have been great. Besides, there are some problems in labor control. In the establishment of some joint enterprises, some managers think they must fully realize the meaning of the existence of the labor union. The fifth problem relates to the regulations about the distribution of foreign exchange and the strengthening of the obligations to export. Owing to the strict control policy over foreign exchange, joint-ventures enterprises or those based on technological cooperation with foreign countreis worry about their production being caught up in difficulties, and so foreign exchange capital must be positively suppled for the importation of advanced foreign technology by local export industries. If foreign exchange capital becomes more flexible and accommodating, the foreign exchange control will be relaxed a little, and thus the obligation to export for the joint enterprises will be strengthened. Sixth, along with the progress of technology transfer, some disputes over the expense of technology transfer will arise. In the introduction of foreign advanced technology, some Chinese in charge do not know about paying technology consulting fees, fees for using others' patents, and deposits for security. For example, the unwillingness to acknoweldge the value of some technologies is the biggest stumbling block in the trade for foreign enterprises to transfer technology to China. In the future, in the cooperation between China and foreign countries, if China does not acknowledge "technology fees," the work of introducing advanced technology will not be able to proceed smoothly. The seventh problem is the restriction of investment proportions in joint enterprises. China has strict restrictions on the number of enterprises that have foreign capital in the majority, which is contradictory to the regulations of joint-venture enterprises. The final important thing is the terms of the joint enterprise. The Japanese enterprises hope that the term designated by the current regulations will be extended appropriately.

FOREIGN TRADE AND INVESTMENT

BRIEFS

TIANJIN JOINT VENTURES--Tianjin's 50 Chinese-foreign joint ventures now in business reported sales of more than 100 million yuan and a profit rate of 24.5 percent in the first 3 quarters of this year. This was disclosed by a leading cadre from the Tianjin Foreign Economic Relations and Trade Commission at the second meeting for Chinese-foreign joint ventures yesterday. He also revealed that a vast majority of the 50 joint ventures have either balanced their foreign exchange income and expenses or achieved a surplus. Six of the 50 concerns have recouped their investments, while business is improving at 3 others operating in the red so far. By year end two of them will have eliminated their book deficits. SPECIAL ECONOMIC ZONES

LIANG XIANG ON SHENZHEN'S ACHIEVEMENTS

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 13 Dec 85 p 3

[Text] The Shenzhen Special Economic Zone [SEZ] has been established for over 5 years now. How is it faring? What are its prospects for development? These questions, which interest everybody in the nation, were answered in a status report by Liang Xiang [2733 4889], secretary of the Shenzhen Municipal CPC Committee, to a general meeting of cadres from departments directly under the CPC Central Committee.

Liang Xiang said that since there was no precedent of a socialist nation establishing special economic zones, Shenzhen had to grope its way forward, based on the CPC Central Committee's intent and demands. Over the past 5 years, the municipality was preoccupied with laying a solid foundation. Its achievements are mainly in the following four areas:

Establishing a relatively attractive investment environment. Shenzhen was originally a small desolate border town, with a very backward infrastructure, especially in energy, telecommunications and transportation. Today we have built or expanded 80 urban roads and established three industrial districts at Shekou, Shangbu and Bagualing, which have begun to take shape; the construction of four others, including Shahe, is in full swing. We have also completed a host of projects in education, tourism, commercial services and municipal administration. The Shajiao Thermal Power Plant was built with foreign capital. The rudiments of a sea and land communication network are in place, consisting of a heliport and four wharves. Already in operation are 11,000 program-controlled telephones, providing direct-dial access to Hong Kong and a dozen cities on the mainland.

Capital projects in the past few years represented $6 billion yuan in investment and provided new footage totalling 8.08 million square meters. They were primarily financed by foreign capital, local funds, investments by enterprises in the interior and bank loans. Direct state investments were minimal.

Importing a quantity of foreign capital and advanced technology. Businessmen and firms from 17 nations and regions have invested in Shenzhen. As of October this year, Shenzhen has concluded 4,300 agreements with overseas investors, with a total value of $3.1 billion, of which $840 million have actually been invested. The latter figure accounts for one seventh of total direct foreign investments in China. We have imported over 30,000 pieces (sets) of equipment of all kinds, of which 40 percent are relatively advanced. A number of wholly owned foreign enterprises and Chinese-foreign joint ventures have been set up and are generally doing well, their profits rate exceeding 85 percent. Over 400 products have made their way into the international marketplace.

Establishing an industry-based economy in the SEZ. There are now more than 750 industrial enterprises in the SEZ, compared to 224 in 1979, a better than 3-fold increase. Employment and total industrial output value have grown 7- and 29-fold respectively. Estimates put this year's industrial output value at 2.4 billion yuan, up 33 percent over 1984. Industry's internal structure has also undergone marked changes. Formerly dominated by processing with foreign materials and other labor-intensive operations, we now manufacture our own products and are gradually moving toward technology- and knowledge-intensive industries. More and more of our products,too, are now destined for the foreign market; from last January through September, the sale of industrial goods made in the SEZ generated 1.3 billion yuan, of which 43 percent were derived from exports. There is a tendency in the SEZ's industrial sector and product mix toward developing products which are "light, small, sophisticated and modern." In agriculture, we have put together preliminarily a production base of a respectable size for fresh produce. Agriculture is becoming commercialized, specialized and intensive. Substantial progress has also been made in commerce, foreign trade, transportation, finance, tourism, the restaurant business, culture, public health, education and so on.

The standard of living of the masses has gone up noticeably. In 1984 per capita income among peasants in the SEZ reached 1,700 yuan and over 80 percent of them have built new houses. The wages of industrial workers too have gone up. The establishment of the SEZ has checked the brain drain from Shenzhen; in fact, over 1,000 people have returned from Hong Kong and settled down in the zone.

Referring to the effects of the zone, Liang Xiang said, "Since its establishment, the SEZ has promoted the opening up of the coastal areas and begun to function as a 'window' and 'shining example,' providing some lessons for reform in the interior and turning out a batch of qualified people. It has also had a positive impact on Hong Kong and Taiwan."

Liang Xiang said, "Through our experience with the open door policy and reform, we are convinced we cannot equate that policy with susceptibility to corruption by capitalist ideas. As long as we do our work well and strengthen the party's leadership and the construction of the socialist spiritual civilization, we can transform negative factors into positive ones."

He said finally, "In every respect today, the zone has laid a good foundation. It is becoming more and more attractive to foreign investors. Shenzhen has a bright future."

SPECIAL ECONOMIC ZONES

LIGHT INDUSTRY BOOSTS EXPORTS IN NEW 5-YEAR PLAN

Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 29 Dec 85 p 3

[Article by Feng Xiao [7458 7197]: "Strong Growth in Light Industrial Exports in the 'Sixth 5-Year Plan']

[Text] During the "Sixth 5-Year Plan," Chinese light industrial exports have increased markedly, reaching a total value of $6.72 billion, up 63.4 percent over the "Fifth 5-Year Plan," Liu Yan [0491 1484], general manager of the China National Light Industrial Products Import and Export Corporation [INDUSTRY] told reporters yesterday. In 1985, the industry earned $1.3 billion in foreign exchange from export.

Under the "Sixth 5-Year Plan," the corporation devoted itself to nurturing the export commodity production points of 80 product lines, including shoes, toys, packaging, glassware, leather goods, plastic products and stainless still tableware, to ensure that export plans were fulfilled and lay a sold foundation for the construction of export commodity production bases.

General Manager Liu Yan said that systematic reforms in the corporation have begun to pay off. Its three subsidiary companies which handle import have registered with the State Industry and Commerce Administration and will go into business on 1 January 1986. They are the China National Home Appliance Import Co, China National Paper and Paper Pulp Import Co and China National Light Industrial Product Technical Service Import Co. They specialize in the import of different lines of products and the provision of post-import services. As legal persons, they follow independent accounting and have managerial autonomy.

In 1985, the corporation seized every opportunity it had and went all out to expand export. It took part in the Guanagzhou Trade Fair twice, held its own light industrial product export talks, organized joint sales missions overseas and shipped mail and phone orders promptly, thereby fulfilling its export targets. In the main, Chinese light industrial exports are destined for Hong Kong, Macao and the Third World. Over the past year, the corporation combined moves to consolidate existing markets with efforts to open up those in Japan, the U.S. and Western Europe. Our exports to Japan and the U.S. in such key categories as shoes, leather, sporting goods, office supplies and toys have all increased substantially. In 1985 we sold over $30 million worth of shoes to those two countries and $5 million worth of fabric toys to the United States.

The cost of exports dropped last year compared to 1984 and was the lowest ever in history.

STATUS OF WORKERS IN JOINT VENTURE ENTERPRISES EMPHASIZED

Beijing GONGREN RIBAO in Chinese 23 Oct 85 p 3

[Article by Beijing Jeep Plant Trade Union: "No Change In Position of Staff Members and Workers Being Masters In Their Own House in Joint Venture Enterprises"]

[Text] As the Party's policy of enlivening the domestic economy and opening the door to the outside world becomes more pervasive, some Chinese and foreign joint venture and cooperative enterprises as well as enterprises solely capitalized by foreign traders have been set up in China's special economic zones, in coastal cities and inland. They have brought new vitality to China's economic construction while occasioning numerous new problems at the same time. Whether or not staff members and workers in these enterprises remain masters in their own house has raised doubts in the minds of some.

Correct handling of this issue requires, first of all, an understanding of the nature of these kinds of enterprises. Chinese and foreign joint venture enterprises have been established under the socialist system to meet real needs in China's modernization. China has shares in them; they are under jurisdiction of China's laws; they are subject to Chinese government leaders, and are jointly run, in fact. They are a special form of economic organization among China's diversified socialist forms of economic organization. In accordance with Lenin's thesis that "State capitalism is capitalism that we are able to control and whose field of activity we are able to decide," Chinese and foreign joint venture enterprises are in the category of state capitalism and thus their character is determined by this.

Staff members and workers in joint venture enterprises must realize, first of all, that no change has taken place in their position as masters in their own country, and that they are still masters of the country and masters of the enterprise. This is determined by our socialist character. Staff members and workers in joint venture enterprises are simultaneously employees of the enterprise, and this is determined by the character of the national capitalist character of joint enterprises. However, staff members in joint venture enterprises are not commodities to be bought and sold freely as in capitalist societies. China has a series of laws to guarantee the democratic rights and the material benefits of staff members and workers.

A look at means of production relationships and distribution relationships shows joint venture enterprises to be a combination of socialist public ownership and capitalist private ownership in which the socialist economic component is frequently greater than the capitalist economic component. This proportional relationship of the means of production determines the common sharing of products by both parties. Means of production relationships and corresponding distribution relationships are the main basis for judging the character of any given economic form.

2. A look at the goals of production shows that that joint venture enterprises serve socialism under guidance of state plan. The goals of both parties to the operation of a joint venture enterprise are by no means the same. The goal of foreign traders is to make a fair profit, while China's goal is to to use the favorable conditions created as a result of the use of joint ventures to hasten the building of the nation's economy and to improve the material standard of living of the people. This production goal is completely synonymous with that of the country's state-owned enterprises.

3. Looked at in terms of development, joint venture enterprises are considerably stable; however, they do not represent by any means the fundamental direction of development of socialist enterprises. Once the period of joint operations is up and after China has bought out the foreign party's shares, the joint venture enterprise reverts to Chinese ownership in entirety, and it becomes an enterprise under socialist public ownership. China's staff members and workers have all the political rights conferred by the socialist national constitution and laws. This differs fundamentally from the political position of workers in capitalist countries.

4. Joint venture enterprises must engage in production and business activities under jurisdiction of Chinese laws in accordance with provisions of the "Joint Venture Enterprises Law." The sovereignty that China exercises is also an expression in concentrated form of the authority of the people, i.e., of every staff member and worker.

To summarize the foregoing, fundamentally speaking, no change has taken place in the position of staff members and workers employed in Chinese and foreign joint venture enterprises being masters in their own house. Therefore, staff members and workers who work in these enterprises should do their work boldly and assuredly with the bearing of masters in their own house, correctly understand and carry out the Party's open door policy and constantly explore and summarize experiences, doing a good job in the joint venture enterprises.

LABOR AND WAGES

NEED TO DEVELOP EXPORT OF LABOR CITED

Wuhan HUBEI RIBAO in Chinese 13 Oct 85 p 2

[Article by He Jinkai [0149 6855 7030]: "Development of Labor Resources Is Imperative"

[Text] Ample labor resources is a major strength of Hubei Province. A survey shows that despite the opening of a series of broad employment avenues in cities and the countryside and the placement of large numbers of the workforce during the past 2 years, the amount of surplus rural labor remains considerable at the present time. Enterprises are also universally overstaffed. Surplus labor figured at 12 percent for the province as a whole means 3 million people. Clearly, potential is great.

How can this potential be converted into wealth? One important way is to organize the export of labor.

The export of labor referred to here includes both export to foreign countries and to other counties, provinces and cities. In 1984, Zhongxiang County exported 11,000 workers and 20 million yuan flowed back into the county. The political research unit in the Hubei Provincial CPC Committee believed that this same county can now export 50,000 people annually who will send back 100 million yuan in earnings, which is equal to a net increase of 500,000 dan of cotton or 600 million jin of grain!

Statistics show that the province's export of labor to other provinces or to foreign countries totaled only a little more than 15,000 people, or only 1 percent of the province's total surplus labor. Of greatest importance at the moment in increasing exports of labor is heightened awareness and improved organizational leadership. It is necessary, first of all, to straighten out the muddled thinking that places today's export of working personnel on the same level with the "Chinese labor" of the old society. A comrade engaged in foreign aid work told the correspondent that "Chinese labor" was the product of special historical conditions. Today when Chinese go outside the country to work, first of all they have the backing of a powerful socialist motherland that is much more respected internationally. Second, personnel going abroad have all the rights they enjoy in China properly respected. Materially, their treatment is of the best, and politically the people regard them as foreign emissaries who may return to their homeland as agreed upon completion of their mission. Yet another important matter is the need to set up needed labor export service organizations responsible for organizing the export of labor, transmitting information, bettering the education and management of exported labor and helping allay the apprehensions of the families of those who depart.

A political economics teacher believes that export of labor is not only of very great economic significance, but is a social university for upgrading the quality of peasants. He said that letting the peasants get a broad view of the vast commodity economy world will help improve skills for development of a commodity economy.

TRANSPORTATION

STATUS OF IMPROVED SHANGHAI-NANJING RAILROAD OUTLINED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 6, 28 Nov 85 pp 4-5

[Article by Xue Guibao [5641 6311 1405]: "The Shanghai-Nanjing Railway"]

[Text] The beautiful and richly endowed Chang Jiang Delta, which the Chinese government has designated an open economic zone, contains abundant resources, a dense population, extremely well developed industry and agriculture, and is the area of the country with highest economic effectiveness. On this golden tract of land run three railroads: the Tianjin-Pukou, the Nanjing-Wuxi and the Shanghai-Hangzhou lines that connect the five large cities of Shanghai, Suzhou, Wuxi, Changzhou, Zhenjiang and Nanjing, plus a trunkline that connects the Chang Jiang with the Grand Canal. This is the 77 year old Shanghai-Nanjing Railroad that has become the busiest transportation artery in east China.

Construction of the Shanghai-Nanjing Railroad began in 1908. It is 311 kilometers long and was constructed with British funds. It was the railroad for which the squandering of funds was most serious among all of China's railroad construction projects. Despite the high construction costs, the equipment was extremely antiquated. Most of the technology used was out of date and the railroad used a welter of small locomotives, small passenger cars, small rails, and small telephones. Transportation efficiency was extremely low. It lost money every year in the 41 years of its operation. Right up until the eve of liberation, it was in the peculiar situation of deriving more income from hauling passengers than from freight. Following liberation, as the People's Government revived transportation and improved efficiency, it steadily increased investment in railroads and carried out a planned technical transformation that very greatly improved the locomotives, railroad cars, stations, tracks, and signaling equipment on the Shanghai-Nanjing line. The former ramshackle equipment was largely replaced with new equipment of superior quality and high efficiency that cost less to operate. Today, the amount of passenger and freight traffic handled by the Shanghai-Nanjing Railroad is six times that of the old Shanghai-Nanjing Railroad (1949).

Powered With Diesel Locomotives

Locomotives provide the power for railroad transportation, and they are the crux in improvement of transportation efficiency. Up until liberation, locomotives used on the Shanghai-Nanjing Railroad were mostly SL, PX, and MK models of small steam locomotives of low horsepower and low pulling power. Furthermore, all these locomotives had been bought abroad, so it was difficult to get spare parts for them and frequently half of them were "laid up." Tonnage pulled per locomotive was very low at that time, only 1,740 tons being hauled. The main criterion for judging locomotive efficiency is locomotive output per day. At that time, this was only 85,000 ton kilometers for the Shanghai-Nanjing Railroad. Locomotive maintenance and repair equipment was also very antiquated. When it was built in 1907, the Longtou roundhouse in Nanjing at the northern end of the Shanghai-Nanjing Railroad had only one temporary locomotive repair shed. It was not until 1935 that a chassis repair shop was built for the repair of passenger cars as well as locomotives. Today the Nanjing East diesel maintenance section replaces the Longtou roundhouse in Nanjing. This maintenance section is huge. It occupies 400 mu of land and is 1.8 kilometers long, the line totaling 1,868 meters. It has three buildings for chassis repairs, wheel repairs and all other work, these buildings covering a 19,372 square meter area. Because the Nanjing East maintenance section has advanced equipment and much skilled labor, its repair efficiency is very high. Take 1983, for example, when it repaired 25 locomotive chassis and 269 locomotive wheels. This section has a large number of Chinese produced Dongfeng diesel locomotives and Romanian made ND 2 diesel locomotives. In September 1985, it will begin to use China's first imports of American produced ND 5 high performance diesels to replace existing diesels. Today all passenger locomotives on the Shanghai-Nanjing Railroad are diesels, and half the freight locomotives are diesels. After the transition from steam to diesel locomotives, locomotive freight tonnage hauled on the Shanghai-Nanjing Railroad rose from the 1,740 tons before liberation to 3,500 tons, and output per day rose from 85,000 ton kilometers per locomotive to 1,119,000 ton kilometers. Cars have also been replaced.

Expansion and New Construction of Railroad Stations

The Shanghai-Nanjing Railroad has always been extremely busy with the hauling of passengers. Take the Shanghai station, for example, which dispatched 30,000 passengers daily during the 1960's, During the 1970's, the number increased to more than 50,000, and during the 1980's, it spurted to between 80,000 and 90,000, with a maximum of 140,000 per day. During the lunar New Year and during the peak travel season, Suzhou Station handles more than 56,000 passengers. Ordinarily the number is also 30,000 to 40,000 per day.

The railroad stations at Shanghai and Suzhou were built in 1906, however. They are cramped and old, and a long way from being able to meet increasingly busy transportation needs. Despite constant improvements since liberation, congestion remains in the purchase of tickets and waiting for trains. In order to deal with this problem, in 1981 the State Council formally approved the building of a new Shanghai passenger station. The new Shanghai station will be an elevated structure that spans the station tracks. Above the station platform will be 16 waiting rooms that total 13,000 square meters in area. The new passenger station will have a total of 17 sidings and seven station platforms; it will have a design capacity for 72 arriving and departing trains daily and a maximum gathering of 10,000 people. After the new Shanghai station has been built, it will become the country's first elevated railroad station that spans the tracks, and it will also be the largest passenger station on the Shanghai-Nanjing Railroad.

In 1982, a new railroad station was built in Suzhou, which is rich in local character. The new station has the air of classical structures. Its roof has upturned eaves and is covered with tea green tiles, which make it fit in harmoniously with Suzhou City. The inside of the Suzhou station has landscapes, pools with rockery and winding courtyards. It deserves to be called a "garden window" on the Shanghai-Nanjing line.

Lengthening of Railroad Line Track

Rail lines are the foundation on which trains travel. Up until liberation, the Shanghai-Nanjing Railroad was a single track line and the line's equipment was not in good shape. On many sections, the road bed was not wide enough and ballast was insufficient everywhere. Sleepers were badly rotted. The biggest problem was the tracks, all of which were light rails of a variety of makes and as many as 53 models. The rails were also very seriously worn, and there were neither filler plates nor anti-creepers anywhere under the tracks. Because of the poor quality of the line and its many faults, train speeds were limited. Maximum train speed was no more than 75 kilometers per hour.

After liberation, the first task was major overhaul of the line, sifting and hardening of road beds, filling in places lacking ballast with stones, replacement of completely defective sleepers, and installation of track filler plates and anti-creepers. Next, most wooden sleepers were replaced with steel-reinforced concrete sleepers and concrete slab sleepers. Small, joined together, hand operated switches were replaced with large manganese steel automatic switches, which increased the line's smoothness. During the 1960's, the Shanghai-Nanjing Railroad got rid of its light mixed makes of rails replacing them with heavy steel rails weighing 50 kilograms per meter. In 1969, the Shanghai-Nanjing Railroad began to use the new technology of welding together tracks in long sections, welding short 12.5 meter long sections of track into long track sections approximately 1,000 meters long to develop the Shanghai-Nanjing Railroad in the direction of becoming a seamless line. Not only did this reduce wear and tear on cars and increase train speeds, but it also greatly reduced noise inside passenger cars for an improvement of conditions for passengers. Now the Shanghai-Nanjing Railroad's main line is 618 kilometers long, 361 kilometers or 58 percent of which is seamless. In 1978 double tracking of the Shanghai-Nanjing Railroad was completed. This transformed the Shanghai-Nanjing trunkline from the pre-liberation single line to a completely doubletracked line, and virtually all of the line consisted of long tracks. Effective length of train station sidings was extended from the 650 meters prior to liberation to the present 1,050 meters. Rise in quality of the line increased train carrying capacity. Before liberation, 27 trains per day traveled the line. Today, 162 trains travel the line in both directions, and the permissible train speed has also increased from 75 kilometers per hour to 120 kilometers per hour.

Signals are the ears and eyes of railroad communications. Before liberation and during the early 1950's, communications and the number of signals on the Shanghai-Nanjing Railroad were in a backward state. Most stations used hand operated semaphore signals, and at night it was necessary to climb up the signaling machines and hang a lantern on them. Either signs along the track or train staff were used to block trains. Most line switches used mechanical junction boxes for signal junctions, and some stations even used hand signals to guide the coupling of cars. Train safety was uncertain and train speeds were also limited. In the mid-1960's, semaphore signaling machines began to be replaced with colored light signaling machines, and electric relay semi-automatic blocking eliminated the mechanical junction boxes. Today, modern automatic blocking has been installed all along the Shanghai-Nanjing Railroad and all signaling machine displays are automatically controlled by electrical equipment. Not only does this insure operating safety, but it also increase one or two fold the number of trains able to travel between one area and another.

Automation of Communications Equipment

During the period immediately following liberation, communications equipment along the Shanghai-Nanjing Railroad was extremely outdated. Old magnetic telephones were used, and they were frightfully few in number. There was only a three-channel carrier between Shanghai and Nanjing, and there was no direct line between Nanjing and Beijing. During the 1960's, common-battery telephones were installed at all major stations along the line. The number of telephones in the section between Nanjing and Changzhou alone numbered 800, which was a fourfold increase over the number during the period immediately following liberation. There was a 12 channel carrier between Shanghai and Nanjing, and a long distance carrier telephone was opened between Nanjing and Beijing. Between Nanjing and Zhenjiang is a short-range carrier telephone. To meet the situation resulting from the opening to railroad traffic of the Chang Jiang bridge at Nanjing and from the Nanjing East classification station, in 1968 Nanjing Prefecture put into operation a 1,000 line automatic telephone exchange thereby completely automating telephones in the Nanjing hub. With the development of semiconductor technology, large scale use was also made of 12 channel semiconductors and three-channel carriers for long-distance communications on the Shanghai-Nanjing line. Opening of carrier return lines reached the apex of power line design, and automatic dialing could be done between Shanghai and Nanjing. With completion of the doubletracking of the Shanghai-Nanjing Railroad during the 1980's and the laying of small co-axial cable, communications improved greatly again. In Nanjing Prefecture alone, the number of telephones increased to 2,200, or an average of 1 telephone per 15 people, and automatic dialing was installed between Nanjing and Changzhou, Danyang, Zhenjiang and Longtan as well as between Shanghai and Suzhou, Wuxi and Nanxiang. A new communications hub for east China railroads with a 3,000 line automatic exchange is being built in Nanjing Prefecture. A 1,000 line automatic telephone exchange is being constructed for the Nanjing East classification station, and a 300 channel small co-axial cable improvement project between Shanghai and Nanjing is underway. The Shanghai-Nanjing

Railroad is in process of building a communications network with many circuits, many channels, and many techniques that is transistorized, miniaturized and automated.

Doubletracking of the Shanghai-Nanjing Railroad and the opening of the Chang Jiang Bridge at Nanjing to railroad traffic laid the foundation for development of both passenger and freight transportation. Before liberation, passenger trains could travel only on the Shanghai-Nanjing line itself; they could not cross over to other lines. Long distance passengers had to repurchase tickets and reboard other trains at either Nanjing or Shanghai. Today trains starting out in Shanghai can go all the way to Guangzhou, Qiqihaer or Wulumuqi.

In the more than 30 years since liberation, the Shanghai Railroad Bureau has not stinted on technical improvements to the Shanghai-Nanjing Railroad. It has used every available means to tap the line's potential to the full, thereby increasing many times over the passenger and freight carried by the Shanghai-Nanjing Railroad. The number of passengers has increased by 4 percent per year; the amount of freight carried has increased by 6.5 percent per year; and earnings from transportation have increased 12.4 percent per year. Today the Shanghai-Nanjing Railroad has become a major trunk line in the national railway network with advanced equipment and remarkable economic effectiveness.

TRANSPORTATION

BACKGROUND PROVIDED ON BEIJING-TAIYUAN RAILWAY

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 4, 28 Jul 85 pp 6-7

[Article by Liu Tongwei [0491 4827 3956]: "The Opening of a Coal Hauling Route in the Early 1970's---the Beijing-Taiyuan Railway"]

[Text] During the early 1970's, a railroad trunk line was built to connect the capital directly with Shanxi Province. This trunk line began at the Shijingshan south station at the Beijing hub and traversed Lianggezhuang, Baijian, Zijingguan, and Futugu. It crossed the Wutai mountain region and went through Pingxingguan, Yanmenguan, and Zaolin connecting with the line running from Datong to Fengling Ferry at the Yuanping station in northern Shanxi. This line was dubbed the Beijing-Taiyuan Railroad. During the past 10 years and more, this railroad has played a very important role in the hauling of coal out of Shanxi Province, to become a major coal hauling route.

Opening of Additional Coal Hauling Routes

As early as the 1950's, the state placed the exploitation of Shanxi's natural resources on its important daily agenda for development of the national economy. Shanxi has various underground resources including coal, iron, copper and bauxite. Coal reserves, in particular, amount to one third of the country's total, and more than two-thirds of the counties in the province have coal fields. Furthermore, coal is of all kinds and quality is outstanding. It has superior quality coal for power and it has coking coal. In northeast Shanxi, along the line running northward from Datong to Fengling Ferry, there are numerous open pit coal mines in which mining conditions are good, reserves large, and costs low. Annual output reaches several million tons most of which has to be hauled elsewhere.

During the period immediately following liberation, except for the Datong to Fengling Railroad and the Shijiazhuang to Taiyuan Railroad in the south, there was only the Beijing to Baotou Railroad in the north as routes for hauling coal out of Shanxi Province. Capacity for hauling coal was extremely inadequate. After the Fengtai-Shahe line had been built, capacity was still inadequate to meet needs. For this reason, the decision was made to build the Beijing to Taiyuan Railroad to add a route for hauling coal.

In addition to hauling coal, the Beijing-Taiyuan Railroad also plays an important role in the exploitation and transportation of local natural resources. The line meanders through the Wutai mountain region and the Taihang range, paralleling or cutting across the Hutuo He, the Tang He, the Juma He, the Dashi He, and the Yongding He. Products are abundant along the line, and underground resources are in process of being exploited. One example is the iron mine in the Wutai mountain region where mining began during the end of the 1950's with several hundred thousand tons being carried away annually. Some of the deposits of copper, bauxite, manganese, and clay have been exploited, and preparations are underway to exploit others. More than 20 feeder railroad lines have been built in this area.

Farm and livestock products are also very abundant in the more than 10 counties through which this line passes. Farm products include millet, corn, potatoes, soybeans and gaoliang. In the Wutai mountain region, one crop per year of naked barley, flax and sugarbeets are harvested, the quality of which is good and the output of which is high. In the animal husbandry field, both the Wutai mountain region and the Taihang mountain region have fine natural pasturelands where the raising of cattle, sheep and goats, horses, donkeys and mules is extremely well developed. Some of the beef and mutton eaten in the Beijing-Tianjin-Tangshan area is supply from here.

Relatively High Standard Mountain Region Railroad

Standards were generally not high for mountain region railroads built right after liberation. Most were second or third rate railroads, and some were built like branch lines. Because it was part of a network and also because it had a big job to do, the Beijing-Taiyuan Railroad was built to relatively high technical standards. It was built as a single track first rate trunk line. Grade was limited to .06 percent (a .12 percent grade in western Pingxingguan). Minimum curve radius was 600 meters; and effective length of the daofa [0451 4099] line was 650 meters; allowance [yuliu - 7315 3966]; at the time of tunnel construction, overhead clearance was allowed for future electrification of the line. "East is Red" diesel locomotives were used to pull trains. Initial transportation capacity was set at 5 million tons, with 10 million tons intended over the long range.

Along the Beijing-Taiyuan railroad line, mountains are high and valleys deep; streams contain rapids; mountains are craggy, rock cracking is well developed, and the geological structure is complex being made up of limestone, gneiss, granite and schist, for the most part, with some new and old loessal soil, sand clay and alluvial pebble layers. Engineering is extremely daunting. Earthquake fissuring is between 6 and 8 degrees, and this has substantial effect on the structure of projects and handling of road beds. The western section of the line parallels the Hutuo He, and in the eastern section, it crosses the Juma He at 10 places at large faults at Dayaobo, Wangjiagou, Gushan, Yuncailing, Zhaobo, Futugu, Zijingguan, Erdao He and Babao Shan. An especially large bridge is located atop the Yongding He fault. The tunnel at Xishankou goes through a coal vein, and beneath the large bridge at Lianggezhuang is a karst cave. Beneath the tunnels at Pingxingguan and Duomaling is a heavy rush of water. All these things increased the complexity of the project.

The Beijing-Taiyuan Railroad is 418 kilometers long. It has 41 stations, 12 tunnels and 216 bridges. Bridges and tunnels have a combined length of 105 kilometers, or one-fourth the length of the entire line. Nearly 30 million cubic meters of material were moved to build the road bed. Work began in October 1958, and by October 1960 the first 60 kilometer section of the line between Yuanping and Zaolin had been built. Construction was temporarily halted at that time due to a general retrenchment of capital construction. Construction recommenced in 1965, first on the eastern end and then in the west, section by section. By October 1971, the entire line was opened to traffic. At the end of 1972, the line was turned over for operation.

Daunting Tunnel Projects

The Beijing-Taiyuan Railroad is noted for its numerous and long tunnels. The 120 tunnels along the line total 87 kilometers in length. There is an average of one tunnel every 3.48 kilometers, and there are 26 tunnels that are more than 1 kilometer long. At the border between Hebei and Shanxi provinces, the railroad has to go through the Duoma mountain range at 1,600 meters above sea level. The longest tunnel on the line is located here---the Duomaling Tunnel that is 7,032 meters long and at a maximum depth of 500 meters.The tunnel goes through through Ordovician limestone strata where there is a fault fracture zone and an ancient river bed containing intercalated sandstone pebble illuvial stratum. It goes through a more than 30 meter deep fault vein and more than 20 karst caves. Maximum ground water flow reaches 6 tons per day and night. There were more than 60 landslides during construction.

The Duomaling Tunnel is one of the major control projects on the whole line. The troop units responsible for construction of the railroad used the technique of "dividing long tunnels into short sections." They excavated numerous short caves using more than 60 construction machines that worked to make parallel excavations ahead that increased the work face. They used high speed excavation to speed up construction progress, required only 24 months to complete the main tunnel project.

The Beijing-Taiyuan Railroad goes through many mountain passes such as Dongyusi, Baijian , Zijingguan, Wang'anzhen, Pingxingguan, and Yanmenguan. There are very many tunnels that follow one after another in some stretches. In only a 1.1 kilometer stretch between Baijian Bridge and Juma He Bridge, for example, there are four tunnels totaling 469 meters in length that are known as the Baijian tunnel group. The terrain is precipitous along this section of the line making construction extremely difficult. The construction units used the technique of "digging a group of tunnels together." First they assembled troops for simultaneous opening of two tunnels followed by the opening of another two tunnels for fastest progress in construction. It took them only 8 months to complete the boring of this group of tunnels.

Mechanized Laying of Rows of Tracks

Track laying is an important procedure in railroad construction. The former method of laying track had generally been to have human labor arrange sleepers on the road bed followed by the placement, one by one on the sleepers, of steel sleepers and spiking them down. This was slow; efficiency was low; labor was highly intensive and it was difficult to assure quality.

In modern railroad construction, track laying operations have been mechanized. This means the operation of track assembly yards at specific points along the line. In these yards, row after row of tracks are arranged in fixed positions in accordance with set technical specifications to form long ladder-like structures, one after another. This method is termed "track assembly production." When the tracks are laid, the assembled tracks are loaded to a track layer and transported to places along the line where they are unloaded on the road bed. This greatly increases efficiency and quality and hastens track laying.

Track assembly production on the Beijing-Taiyuan line is centralized at the assembly yards at Shijingshan south station, at Baijian, and at Wutai. Production of track assemblies involves anchoring, spacing of sleepers, matching of tracks, putting on attaching hardware, tightening bolts, inspection and loading on to railroad cars. It is done as an assembly line operation. After the tracks have been assembled, they are stacked up in piles in the yards from which they may be transported to be laid along the line at any time. Each track assembly yard can manufacture between 48 and 60 track assemblies daily, sufficient to the laying of between 1.2 and 1.3 kilometers of railroad line.

The Alluring Scenery Along the Line

The Beijing-Taiyuan Railroad goes through the Taihang Shan and Wutai Shan mountain regions and the southern foothills of the Heng Shan. Mountains and rivers crisscross the line; the topography is difficult of access; the scenery is singular, and there are numerous famous historical sites that are rather alluring. A train passing through Shijingshan south station and going to Shidu Station passes through a scenic area. Here verdant peaks rise one after another and streams flow along slowly. This area is noted for having the Guilin scenery of north China. The train travels westward to Zijingguan, which is a famous historical site. Here the sheer cliffs stand like walls, and this is the area of the seventh trail of the "Taihang Eight Trails." In mid-summer, it is possible to see Chinese redbud all over the mountainland and to enjoy magnificent and beautiful view of the Great Wall. Farther westward at Laiyuan, one can see Chanlin Temple built during the Liao Dynasty. Continuing onward to Pingxingguan, one comes to to a site where large numbers of Japanese troops were annihilated during the Pingxingguan campaign during the early period of the War of Resistance to Japan. Here there are range after range of mountain peaks, deep valleys with streams, dark green pine and cedar trees, and the battlefield of a former day has become a tourist site. In addition, here in Dai County stands the Yang family memorial temple to the five generals of the Yang family of the Northern Song Dynasty and Yanmenguan, which is "the most strategic point." The construction and the statues in Huiji Temple in Yuanping County have the flavor of the Song Dynasty. All these places are ancient historical sites.

It is Wutai Shan, however, that is the most noted tourist area along the Beijing-Taiyuan Railroad. Wutai Shan is located in the southeastern part of

Fanshi County, and it is one of the four most famous Buddhist mountains in China. The view from atop the mountain is magnificent and beautiful; the climate is cool and crisp making it a good summer vacation spot. The mountain is thick with temples, many of them concentrated in Taihuai Village. During the historical period when temples were most numerous, there were more than 200 of them here. Today more than 40 survive. The buildings are magnificent; the carvings are exquisite, and painted statues are found in every temple. The Sheli great white dagoba, Xiantong Temple, Shuxiang Temple, Boddhisatva Mountaintop, Jinge Temple, Nanshan Temple, and Zhenhai Temple are all famous temples here. Xiangtong Temple is the largest of all of them. Inside the temple is a copper hall that contains 10,000 small Buddhist castings and characters made from flowers and plants, the modeling of which is exquisite and which are unique and beautiful.

Once trains began to run over the Beijing-Taiyuan line in 1972, not only did they provide a convenience for travelers, but they also promoted development along the line. The volume of transportation has grown steadily, cargo transported amounting to more than 5 million tons annually, which is already larger than the originally designed capacity. More than 1 million passengers also travel this line, making trains fairly crowded.

TRANSPORTATION

BEIJING-TONGLIAO RAILROAD EVALUATED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 4, 28 Jul 85 pp 8-9

[Article by Chen Yuanmou [7115 6678 6180]: "The Second Transportation Trunkline to Connect Places Inside and Outside the Great Wall---the Beijing-Tongliao Railroad"]

[Text] Five years have passed since the Beijing-Tongliao Railroad was built and turned over for operations. But whenever this railroad is mentioned, some people seem unfamiliar with it. This is a railroad that starts out in Beijing, parallels the Beijing-Shenyang Railroad, and crosses the newly built industrial cities of Zhelimu League in the Nei Monggol Autonomous Region ending at Tongliao. It is the the second transportation trunkline to connect places inside and outside the Great Wall.

The Beijing-Tongliao Railroad starts at Changping in suburban Beijing, goes through Luanping, Longhua, and Weichang counties in Hebei Province, goes through Chifeng in Zhaowuda League and Naiman in Zhelimu League in the Nei Monggol Autonomous Region and on to Tongliao for a distance totaling 805.77 kilometers. Work began all along this line in August 1972, and by 4 December 1977 all track had been connected and the line opened to traffic. On 1 May 1980, construction of associated facilities was completed and the line was turned over for operation. The division of freight between this line and the Beijing-Shenyang Railroad has greatly eased congestion on the old transportation line.

A Daunting Engineering Project That Goes Through Yan Shan and Across Sand Dunes

The western section of the Beijing-Tongliao Railroad snakes through the southern foothills of Yan Shan. The 171 kilometer section that runs from Heishui Shan to Longhua traverses the Yanshan hinterland where the topography is precipitous, is crisscrossed with ravines, and where faults interlock making the geology complex and requiring a succession of bridges and tunnels. The project was an extremely arduous one. To the east of Chifeng the terrain is flat; however, the railroad line traverses shifting sand dunes so projects to ward off and stabilize the sand were numerous. The road bed for the entire line required a total of 66.72 million cubic meters of earth and stone. The line has 116 tunnels totaling 77.97 kilometers in length. This includes a total of 11 tunnels, each more than 2 kilometers long for a total length of 31.92 kilometers. The Red Flag Tunnel that goes through the watershed between the Luan He and the Yisun He is 5,848 meters long, the longest tunnel on the whole line. Troops were assembled for the construction, which took 23 months, the construction proceeding at an average total of 254.3 meters per month from both ends of the tunnel. A swarm of tunnels was built at the Gubeikou, Hushiha and Miaogong sections. In the 10 kilometers between Hushikou and Gangzi, there are 16 tunnels with a total length of 3,860 meters. At places where the railroad crosses the Chaobai He, the Luan He and the Daliao He water systems, 450 bridges totaling 44.75 kilometers in length were built. This included 14 especially large bridges 500 meters or more long totaling 10.74 kilometers in length. The 1,447 meter especially long Laoha He Bridge is the largest bridge in northeast China today. The Baihe Bridge at the entrance to the Miyun Reservoir is 402 meters long and is the most complex steel truss bridge with a deep water foundation on the whole line. During construction, the water was 24 meters deep, and the open caisson steel bridge piers were sunk 22 meters into the river bed. The whole bridge contains 22,000 cubic meters of masonry and 385 meters of steel trussing weighing 1,987 tons. In the area around Shelihu in Naiman Banner on the southern fringe of the Keerqin Desert is located the country's third largest shifting sand dunes. Tall and low sand dunes undulate across the landscape. In each windy season, when the wind howls, the sands shift destroying structures on the surface of the land. The railroad has to go through 30 kilometers of shifting sand dunes and 130 kilometers of shifting sandy flatlands. To bring the yellow sand under control and prevent sand damage to the line, large shelter projects were built. The most important such projects were the laying of 200,000 cubic meters of crushed stone, the spreading of 20 million jin of tree boughs to stop the sand, and the afforestation of more than 24,600 mu to stabilize the sand. Now trees stand in profusion on both sides of the railroad like a green Great Wall in the middle of a boundless sea of sand. They effectively lock out the creeping sand and protect the line, keeping it open and free from obstacles.

Through the Great Wall and Across The Hunting Grounds With Magnificent Scenery

As the Beijing-Tongliao Railroad meanders around inside and outside the Great Wall, it passes through majestically serene scenery and numerous famous historical sites. The railroad goes from Changping Station northeastward past the Ming Tombs Reservoir Dam and the north shore of Miyun Reservoir and flies across 15 large bridges for a stretch of more than 30 kilometers. Passengers aboard the train can enjoy to the full the beautiful lake-like appearance of the reservoirs. From the Gubeikou railroad station at the Great Wall, they can look westward from the station platform where they will see only a series of peaks, each one rising higher than the other and the magnificent Great Wall meandering and twisting across craggy mountain ranges. Gubeikou is the major route for going from Beijing to the area beyond the Great Wall, and it has historically been a strategic military pass. At the passage through the Great Wall, there are three or four roads leading inside and outside the wall and towers rise up around to guard the area. The imposing view surpasses the views at Juyongguan and Badaling. The railroad heads from Jinshanling at the foot of the Great Wall to the ancient city of Longhua outside beyond the Great Wall. Here beneath Taishan lies the cemetery of the honored martyr, Dong Cunrui. This is the place where the famed combat hero Dong Cunrui courageously sacrificed his life in the cause of the Liberation Army on 25 May 1948 to blow up a pillbox in the liberation of Longhua. In Weichang County, the railroad crosses the Mulan Hunting Ground where the Qing Dynasty emperors conducted military and political activities "practicing military arts to pacify distant places." Historical records show that in 1681, to maintain the riding and shooting traditions of the Manchu and Mongol forces and to solidify the unity of multiple nationalities, the Kangxi emperor personally led a group of Manchu and Mongolian cavalry troops on a reconnaissance of the landscape beyond the Great Wall where they discovered a valley set below high mountains with dense forests, which was a haunt of wild animals. It was an extremely fine natural hunting ground, which was given the name Mulan Hunting Grounds (in Manchu, mulan means places for sighting deer). For more than 140 years beginning from the 25th year of the Kangxi reign, the Qing emperors regularly traveled to the north to conduct their "annual autumn hunting ceremony." Today on both slopes along the railroad at Yisun Pass stand a stele with characters in the handwriting of the Qianlong emperor that reads, "Matters to be attended to at Yaokou," and a stele in Chinese characters in the hand of the Jiaqing emperor that reads "Account of Mulan." In a pine forest tract near the Miaogong Railroad Station stands a serene ancient Donggong temple. The splendid landscape and the hunting ground with its numerous historical sites attracts both Chinese and foreign sightseers.

Promotion of the Unity of Nationalities and Economic Development

Between the origin of the Beijing-Tongliao Railroad and its intersection with the Beijing-Baotou Railroad, it crosses the Chengde-Longhua and the Chifeng-Boshou branch lines, which are interlinked with the Beijing-Chengde and the Jinzhou-Chengde railroads. At its terminus, it connects with the Hushan-Jiatun Railroad and the Tongliao-Linhe Railroad to become an important integral part of the north China and northeast China regional railroad network.

Construction of this railroad line opened a railroad transportation route running directly from Hohhot in the Nei Monggol Autonomous Region to Hailaer in Hulunbeier League. The direct connection between the capital of the autonomous region with the three eastern leagues made closer the friendly intercourse among the various nationalities throughout the region, and increased unity among the nationalities. In addition, it played an active role in promoting economic development in mountain regions, sandy wastes, cities and villages along the railroad line.

Because of poor transportation in Luanping County deep in the Yan Shan, it had formerly been impossible to develop and use the mountain region's natural resources and native products. After the opening of the Beijing-Tongliao Railroad, large scale exploitation began of the county's 5 million tons of quartz reserves, large quantities of the rock being shipped by rail to Beijing and exported abroad. The mountain region is covered with rocks and sand, which were also hauled by rail to Beijing and Tianjin for use as construction materials. Even the stalks of hybrid gaoliang, which had formerly been used as fuel, were also hauled by the tons to places such as Qinhuangdao to be used as raw materials for making paper. The cash income of the masses increased correspondingly. The people said happily, "There are treasures everywhere in the mountains, but if they cannot be transported out, they are like trash."

Before liberation, there was a popular saying in Naiman Banner in Zhelimu League that went, "When the yellow dragons of sand churn and the sand dunes moves, walking along with a load on one's back is like carrying lead, but a single measure of grain carried over a great distance can be exchanged for only one-tenth as much salt. Nine out of every 10 people who leave never return." Following liberation, a 166 kilometer long highway was built to Tongliao. This made it easier to travel; however, the highway was frequently blocked by shifting sand dunes making movement impossible. The Beijing-Tongliao Railroad runs 123 kilometers through 12 villages and small towns throughout the banner. During the past several years, the Banner CPC Committee has built a total of nine roads leading to the railroad trunk line that pass through 29 villages and small towns in the banner, so vehicles can move a distance of more than 630 kilometers. Today, the fine wool that is produced in Naiman from superior breed Aohan sheep, and the famed red oxen, large red-tailed carp, Chinese ephedra [Ephedra sinica], and sand for making glass, that are special products of the region, are carried by railroad everywhere in the motherland, and some are even sold in distant foreign markets.

NORTH XINJIANG RAILROAD CONSTRUCTION UNDERWAY

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 6, 28 Nov 85 pp 6-7

[Article by Wang Mingkui [3769 2494 1145]: "An Important Trunkline Serving the Northwestern Part of the Country---The North Xinjiang Railroad"]

[Text] The lofty Tian Shan range runs uninterruptedly from east to west across the middle of the Xinjiang-Weiwuer Autonomous Region dividing it north and south. Now an important trunkline that is continuous with the Lanzhou-Wulumuqi Railroad, the North Xinjiang Railroad, is under construction running westward along the foothills of the Tian Shan, across the southern fringe of the Dzungarian Basin and on to Ala Pass. This railroad is of major significance in connecting Xinjiang with inland China and in hastening the building of northern Xinjiang, as well as in developing foreign trade and strengthening national defense.

Extension of the Lanzhou-Wulumuqi Railroad

The North Xinjiang Railroad is an integral part of the Lanzhou-Wulumuqi Railroad.

Back in October 1954, the governments of China and the USSR issued a joint communique on the building of a railroad running from Lanzhou to Wulumuqi to Alma-Atinskaya, which provided that the Lanzhou-Wulumuqi line would connect with international trunk lines in the USSR. After construction of the line, it would connect in the east with the Long-Hai Railroad to form a major artery stretching east and west from one end of the country to the other as another major international trunkline.

Surveying and design work was completed in 1958 for the line running from Wulumuqi to the national frontier, i.e., the North Xinjiang Railroad, and work got underway. In May 1961, construction was halted for cause. Approximately 70 percent of the road bed earth and stone, plus basic abutments for bridges and culverts on the entire project had been completed. The direction followed by the North Xinjiang Railroad now is substantially the same as that of the original design; thus, it is a continuation of construction. The North Xinjiang Railroad begins at West Station in Wulumuqi and goes through Changji, Hutubi, Manasi, Shihezi, Shawan, Wusu, Jinghe and Bole to Ala Pass on China's western frontier for a distance of 470 kilometers. The line connects with the

Dukou Highway, which crosses the Tian Shan to connect northern and southern Xinjiang Province. It intersects the highway that parallels the oil pipeline running from Kalamai to Wulumuqi, and it parallels the highway running between Wulumuqi and Yili, making it a main line in the Xinjiang transportation network.

The Wulumuqi to Wusu section, which is the first phase of construction, is approximately 240 kilometers long. Terrain along this section is flat, most of it being earth strewn with rocks and pebbles. The original design standards call for a first class line of single track with a .006 grade limit, a maximum curve radius of 800 meters, diesel locomotives, electric relay semi-automatic blocking and the construction of one section station and 20 intermediate stations. The near term total volume shipped and received is approximately 7 million tons, 64.9 percent of which is to be incoming and 35.1 percent of which is to be outgoing.

The First Joint Venture Trunkline

In recent years, most of the railroads built by the region have been branch lines or connecting lines. The North Xinjiang Railroad, however, is the first network trunk line built as a joint national and regional venture.

Funds required for the section of the North Xinjiang line between Wulumuqi and Wusu were provided jointly by the Ministry of Railways and the Xinjiang Autonomous Region, and both parties jointly established the North Xinjiang Railroad Company to be responsible for carrying out construction. Following construction, the railroad is to be run independently by this company; special transportation rates are to be applied, and profits are to be used to repay capital plus interest. This company will also be responsible for the building and operation of the entire North Xinjiang Railroad.

Reform of the closed management system of single party construction and operation of the road and the institution of joint venture construction and operation has stirred the region's enthusiasm. The Xinjiang Production and Construction Corps and the 36117 unit of the Wulumuqi Military Region are doing the construction work on this railroad project; consequently construction proceeds more rapidly. Work on the section between Wulumuqi and Wusu formally began on 1 May 1985. Plans call for tracks to be laid as far as Wusu in 1987 and the line to be handed over for operation in 1988.

Pearls Along the Old Silk Road

The general orientation of the Xinjiang Railroad is along the northern route of the old silk road of 2,000 years ago, which has become a major industrial base today for Xinjiang industry and agriculture. Along the line, numerous newly built cities and towns extend like a string of shiny pearls glinting brightly.

Wulumuqi, the starting point for the North Xinjiang Railroad, is the capital of the autonomous region. More than 2,000 years ago, this area was a pastureland with plenty of water and lush grass. Subsequently, it became a major town on the silk road. During the reign of Xuandi [B.C. 73-48] in the

Han Dynasty, Wulumuqi was a "territory under the rule of Houwang of the state of Cheshi." During the Tang Dynasty, the "northern territory" was established in the eastern part of Wulumuqi. In 1765 (the 30th year of the reign of Emperor Qianlong of the Qing Dynasty), the city walls began to be built. At the time of the founding of New China, the city had a population of fewer than 80,000; the area of the city was very small, and it was economically and culturally backward. Today the population numbers more than 800,000 and the city has an area of more than 40 square kilometers. It has become the political, economic, cultural, and communications center of the autonomous region and a new city on the northwestern frontier of the motherland.

Before liberation Shihezi was still a small village of only 20-odd households beside which lay a dry river bed strewn with broken stones, hence the name Shihezi [or river of stones]. Following liberation, thanks to the arduous struggle of military reclamation soldiers, one storeyed building after another and one industrial plant after another rose on the barren land. Today the new city of Shihezi has a population of 130,000 and an area of 17 square kilometers. It has become an important base for Xinjiang's light and textile industries. Here the streets are clean, green trees form a canopy, the air is clear and the environment is delightful, thrilling the heart and pleasing the eye.

Ala Pass at the terminus of the Xinjiang Railroad is located in Bole County in the Boerdala Monggol Autonomous Zhou all around which is open ground. On both sides of the mountain pass here lies the vast Gobi and grasslands. After the North Xinjiang Railroad is built, this area will become an important entrance way into northwestern China.

The USSR calls Ala Pass the Dzungarian Pass. According to the April 1956 joint conference communique issued by the leaders of the two countries, this was to be the point of connection between the railroads of the two countries. During July of that same year, a railroad delegation from both China and the USSR signed an accord further proposing that the line go to the south shore of Aibi Hu where a rail connection point would be designated. The design prepared at that time called for the establishment of separate transshipment stations at Eheerlili (meaning friendship in Mongolian) in Chinese territory and at Druzhba (meaning friendship in Russian) in the USSR. By August 1958, the USSR had constructed a railroad to the frontier. When one states on an observation platform at a sentry point on the border near Ala Pass, one can see clearly the train station and railroad cars in the USSR.

Construction of the North Xinjiang Railroad lies just around the corner. Then the old silk road will become an artery of iron and steel. In the future, the Long-Hai and the Lanzhou-Wulumuqi lines will be linked to it and rails will connect it to the Soviet railroad. Trade back and forth between China and the USSR, East Europe and the Arab countries will be more convenient and both economic and cultural exchanges will be closer.

TRANSPORTATION

ELECTRIFICATION OF LONG-HAI LINE DISCUSSED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 6, 28 Nov 85

[Article by Feng Jinzhu [7458 6855 2691]: "Mid Section of Long-Hai Railroad Electrified"]

[Text] The section between Zhengzhou and Baoji on the Long-Hai Railroad totals 680 kilometers in length. It extends eastward to Lianyungang and westward through Baoji to connect with the Baoji-Lanzhou, Lanzhou-Xinjiang and Baoji-Chengdu lines. At Zhengzhou and Luoyang, the line intersects the Beijing-Guangzhou and the Jiaozuo-Zhicheng trunklines respectively. At Mengyuan, Xian and Xianyang, it intersects the Datong-Fenglingdu line, the Xian-Huxian line and the Xianyang-Tongchuan line respectively. It is a main transportation artery running across China from east to west, and it is an important route that runs from the coastal provinces to the northwest and southwest. As volume of traffic steadily increases on the Beijing-Guangzhou, Jiaozuo-Zhicheng, Baoji-Lanzhou and Baoji-Chengdu lines, and particularly on the Datong-Fenglingdu and the Xianyang-Tongchuan lines, transportation over this line also becomes increasingly heavy. Despite doubletracking, annual transportation capacity is only 19 million tons, but the actual volume of transportation is more than 20 million tons making this a hard pressed section of the Long-Hai line. To increase transportation capacity of this section of the railroad, and meet needs for hauling coal from southeastern Shanxi, western Hubei and western Shaanxi, in 1982 the state decided on the technical transformation of this section of the line through electrification.

Technical Transformation Through Electrification

Acting in accordance with the principle of construction over a period of time and enjoying benefits over a period of time to produce transportation capacity as quickly as possible, it was decided to build up the sections with a weak transportation capacity between Luoyang and Sanmenxia and between Zhengzhou and Luoyang. This would be followed by the building of the section between Sanmenxia and Mengyuan, and finally the building of the section between Mengyuan and Baoji. Inasmuch as this section of the railroad was a first class trunk line where line conditions were fairly good, the amount of technical transformation of the line required in advance of electrification was fairly small. Improvements were needed on only individual sections. In the electrification of this section of the railroad, many advanced techniques and measures for improvement were used. For example, the main transformers in the pulling transformer station used the fixed reserve method, which both saved on the use of land and reduced the amount of soil excavated while increasing the dependability of electric power supply. Vacuum circuit breakers were used on 27.5 kilovolts. Installation and linking to the capacitance compensation equipment increased the performance factor. The direct current power supply for the transformer station and the section points uses high discharge rate alkaline nickel-cadmium storage batteries to reduce the electrified railroad's disturbance of signaling and other equipment outside the railroad line. Within the pulling electric power supply system, current absorption transformers and backflow line equipment was installed as needed in sections. To save on the amount of land used and use less farmland, most contact grid work areas were co-located with the electric power supply sections on the pulling transformers. Dedicated lines for contact grid track vehicles were used in common with transformer station dedicated lines. Insulators with a 920 mm or 1,200 mm leakage distance were used on the contact grid. This was a 200 to 400 mm increase over those currently used and it greatly increased the degree of insulation of the contact grid and dependability. In addition, to solve the problem of power supply to large electric current sections, heat treated aluminum, magnesium, silicon and rare earth alloys were twisted together to form a carrier force bearing cable. Overhead ground wires were used as post ground connections thereby reducing the effect of post ground connections on signal track circuits. Both main line and station line connection grids used full compensation simple chain type hanging. Communication lines used small co-axial large multiple shielded electric cables. Signaling equipment used electric current concentration, automatic blocking, locomotive signaling and automatic stopping equipment. Time between trains is 8 minutes. Following electrification, traffic capacity will increase from the previous 72 trains per day to 172 trains per day, and hauling capacity will increase from the former 20.5 million tons per year to 68 million tons per year. The train pulling fixed number will rise from the former 2,600 tons to 3,500 tons. Overall transportation efficiency will increase more than twofold, and the transportation shortage situation will be alleviated.

Work began in 1983 and 1984 respectively on the Luoyang-Sanmenxia section and the Zhengzhou-Luoyang section, and plans call for completion at the end of 1986. All the other sections are to be built during the Seventh 5-year Plan period. At that time, the line will connect with the Baoji-Lanzhou electrified railroad over a total of 1,183 kilometers, and the line will become the second longest electrified railroad line in China.

Plentiful Material Resources

The Zhengzhou-Mengyuan section of the Long-Hai line is in Henan Province where mineral resources along the line are plentiful. Yima Prefecture is one of four major coal fields in Henan with several billion tons of coal reserves. Buaxite reserves are second largest in the country, large and medium size deposits having been verified at 19 sites. They are found mostly along the Long-Hai Railroad to the west of Zhengzhou and in Baofeng Prefecture near the Jiaozuc-Zhicheng Railroad. More than 1 million tons are mined annually. Molybdenum heads the list of non-ferrous and precious metals. Reserves are large; seams are thick; quality is high; and other metals are found with the molybdenum including iron, copper, wolfram, lead and zinc. In Lanchuan alone, molybdenum reserves of more than 1 million tons have been verified. Gold reserves amount to more than 900,000 tons, most of them being concentrated in the Lesser Qinling region of Lingbao. The natural oil shale of Zhuquansi in Mixian rivals the quality of the oil shale found in Arkansas in the United States, and it has found ready acceptance by foreign customers.

The Mengyuan-Baoji section of the Long-Hai line begins at Tongguan in the east and terminates at Baojixia in the west. It is located in western Shaanxi Province and traverses the central Shaanxi Plain where the soil is fertile and agriculture well developed, the area having been dubbed "the 800 li Qin expanse." Thanks to the intensivity of agriculture and the extent to which irrigation has developed, this region has become renowned as a wheat and cotton growing area of the country. Eighty-five percent of Shaanxi Province's wheat and 90 percent of its cotton are produced here. Since liberation, numerous large and medium textile printing and dyeing plants have been built at Xian, Xianyang, Baoji, Guozhen, Weinan and Dali, where one-tenth of the country's spindles are located. This is one of the country's major textile industry bases. Large reserves of coal are found along the Long-Hai Railroad that are second only to those in Shanxi for an important position in the country. They begin in the lower reaches of the Jing He and extend eastward through Tongchuan, Baishui, Pucheng, Chengcheng, Heyang, Hancheng, and across the Huang He where they connect with the coal seams of Shanxi, a distance of several hundred kilometers. The area is known as the "black belt of Shaanxi." Yanchang, Fuxian and Luochuan are famous inland petroleum bases in China. In addition, there are many deposits of gold, silver, copper and iron along the line.

Important Cities Along the Line

Zhengzhou, the capital of Henan is a communications hub between the north and the south, the east and the west in China. It has been dubbed "impregnable hub that controls a strategic area." Before liberation, it was called the "city of windblown sand," but today it has been transformed into a new style industrial city where industrial plants are as numerous as forest trees and where green trees form a canopy. It has more than 800 large and small metallurgical, electric power, coal, chemical industry, construction materials, electronics, and food enterprises, and it is an important base for the country's textile industry and for its machinery and aluminum smelting. Zhengzhou is one of the centers of China' workers movement. It was the place of origin of the Great "February 7" strike of 1923. The monument to the "February 7 Massacre" towers over the center of the city. It is a unique structure that is imposing and beautiful. From atop the memorial, one can gaze out over the beautiful landscape around Zhengzhou.

Luoyang is located on the south bank of the Huang He in a small basin of the western Henan highlands. Luoyang derives its name from its location on the north side of the Luo River. Luoyang has a long history. Nine different dynasties built their capital here including the eastern Zhou, the eastern Han, the Wei dynasty founded by Cao Cao, the northern Wei, the Sui, the Tang, the posterior Liang and the posterior Tang, earning the city the name, "ancient capital of nine dynasties." Historic sites are numerous. South of the city is a lookout tower atop a gate that has been named for a famous minister of the Tang Dynasty from which the scenery is beautiful. The Longmen Caves located here are one of the three cave art treasure houses in the country. Baima Temple is one of the earliest Buddhist temples built in China, and is on a grand scale. Luoyang is also a new industrial city, which has nationally renowned tractor plans, ball bearing plants, mining machinery plants, locomotive plants, glass plants, and refractory materials plants. Luoyang is also known as the "poetry capital" and as "flower city." Luoyang peonies are famous in both China and abroad.

Xian is located in the middle of the central Shaanxi Plain that is fertile for 1,000 li around, and on the banks of the Jing and the Wei rivers. It is the largest city in northwest China, and the political, economic, cultural, and communications center of Shaanxi Province. The ancient name for Xian was Chang'an. The city is more than 3,000 years old. Since B.C. 1162, it has served as the capital of 11 dynasties over a period of more than 1,100 years. Peasant rebel armies, including those of Huang Chao and Li Zicheng also established their political power here. This is one of China's six major ancient capitals. Scenic historical sights abound. There is the Xian collection of large stone tablets, the Great Goose Pagoda, the Small Goose Pagoda, the museum at Banpo Village, the tumulus of Qinshihuang, the warm springs at Lishan, the walls of Xian, bell towers, drum towers, Daqingzhen Temple and numerous ruins and ancient tombs serve as genuine Chinese historical and cultural treasure houses. The memorial site to the revolution has an Eighth Route Army Xian office memorial hall. Today, Xian has become a center that attracts the most tourists. Xianyang is located in a corner of the Jiujun Shan to the north of the Wei Shui, hence the name Xianyang. Xianyang was also one of China's ancient capital cities, and contains ruins of the Qin Dynasty capital, Zhou Dynasty tombs, Western Han Dynasty tombs, and Tang Dynasty tombs at many places. Today, the outlines of a new industrial city has begun to take shape. The textile industry is best developed, and its output of cotton cloth and cotton yarn is second only to that of Xian. It has become the second cotton textile base in the northwest. On the banks of the Wei He in Xianyang's western suburb Asia's largest colored kinescope plant has been built with a production of 960,000 kinescopes annually. The both ancient and youthful Xianyang is thriving and full of vitality.

Baoji, located on the western fringe of the central Shaanxi Plain is a choke point for transportation to the northwest and southwest, and it is a concentration and distribution point for materials going into and coming out of Shaanxi, Gansu and Sichuan provinces. It is the second largest industrial city in Shaanxi Province. Construction of China's first electrified railroad will begin here.

TRANSPORTATION

RAILROAD COMMUNICATIONS, SIGNALING EQUIPMENT MODERNIZED

Beijing TIEDAO TONGXIN XINHAO [RAILWAY COMMUNICATION AND SIGNALS] in Chinese No 9, Sep 85 pp 1-3

[Article by Electrical Bureau, Beijing Railway Bureau: "Good Performance in Improvements To Hasten Railroad Modernization"]

[Text] I. Important Responsibility of Railroad Electrical Departments

As a result of the efforts made by the whole Party and the whole people of the country since the 3d Plenum of the 11th CPC Central Committee, a historic change has taken place in which the work of the whole Party has shifted to socialist modernization centering around the building of the economy. "Decisions on Reform of the Economic System" prepared by the 3d Plenum of the 12th CPC Central Committee called for a hastening of the pace of reform of the entire economic system focusing on cities. Railroads are to take the lead in the takeoff of the economy. The Beijing Railway Bureau located in the capital city and with railroad routes in three provinces and two cities under its jurisdiction, is responsible for a quarter of the country's freight shipments, an eighth of its passenger transportation, a third of its coal shipments, and four-fifths of Shanxi Province's coal shipments outside the province. To bring about the magnificent plan for quadrupling the output value of the national economy by the end of this century, the Beijing Railway Bureau's volume shipped will have to increase 1.5 fold between 1980 and 2000. To meet this requirement, during the Seventh 5-year Plan period, the state will concentrate financial and material resources in the Beijing Railway Bureau for investment in the building of new lines, double tracking and triple tracking of several hundred kilometers and for the electrification of nearly 1,000 kilometers. Nevertheless, even after benefits are received from these projects, the amount shipped will still not meet requirements. The unfulfilled portion will have to be satisfied through improvement of existing equipment and the tapping of its potential, and through technical progress.

The development of science and technology presently plays a major role in increasing railroad transportation capabilities and in ensuring transportation safety. Electrical equipment is outstanding for being able to produce quick results from small investment. This characteristic has been demonstrated in practice. Completion of automatic blocking on the Beijing-Shanhaiguan Line and on the Feng-Sha main line running from Beijing through Sanjiadian and Shacheng to Zhangjiakou, "changing from 10 to 8," greatly enhanced these lines traffic bearing capacity, and the opening for use of all electric interlocking at railroad stations reduced the number of moving accidents to the former fewer than 10 percent for extremely remarkable overall economic benefits. These are clear-cut examples. Yet, as railroad transportation develops, as new equipment is added, and as new technology is adopted for use, electrical departments will bear an increased responsibility for safety in railroad transportation. So as to continue to meet the needs of transportation departments, relations between the railroads" electrical departments and other departments will become increasingly close. Railroad electrical departments will shoulder increasingly heavy responsibilities for the safety and high efficiency of railroad transportation.

2. Development of the Beijing Railroad Bureau's Electrical Equipment

Thanks to the consideration shown by the Ministry of Railways and leaders of the Beijing Railroad Bureau, the bureau's electrical equipment has expanded fairly rapidly in recent years. As of the end of 1984, the bureau had the following equipment:

Automatic blocking on 2,124 kms, or on 35.7 percent of the distance over which it operates; electric interlocking at 285 stations, or among 42 percent of the total number of stations; six mechanized humps (one of which is semiautomatic); dispatch control on 113.7 kms; and 5,551 kms of electric cables (including 1,887.6 kms of long distance electric cables).

The figures given above show the very rapid expansion of the bureau's electrical equipment in recent years. Furthermore, the scope of service that the railroad electrical system has provided to other sectors of the railroad bureau has also expanded, and its service capabilities have also increased. At the same time, it has added large amounts of new equipment such as 25 Hz inter-area track circuits and frequency shifting automatic blocking equipment. It has also applied computer technology and large numbers of technical innovations. All these things have provided a powerful guarantee of transportation safety and they have raised the effectiveness of available equipment.

To meet needs for development of production, we have carried out efforts to reform the management system and the maintenance and repair system in electrical work throughout the bureau. Reform of the maintenance and repair system has consisted primarily of the promotion of a "three repairs and one checking" system, with increased building of signals repair and spare parts shops, communications signal inspection and repair shops, radio broadcasting station inspection and repair shops, and such electrical maintenance and repair bases. All signal equipment has been brought into the shops for repair and major repairs of equipment on the line has been reduced. As of the end of 1984, the shop repair rate for traffic signaling equipment was 80 percent; the shop repair rate for signal equipment was 70 percent. Shop repairs greatly improved inspection and repair quality and hastened progress in the direction of the industrialization of maintenance and repair work. In addition, standardization and modularization of of parts has been achieved for a substantial portion of signaling equipment that has improved equipment interchangeability and has reduced friction between equipment maintenance and transportation organizations.

Methods adhered to during recent years to raise the level of scientific management and promote all-round quality control. This effort has included the launching of a widespread quality control team campaign. As of the end of 1984, there were 312 quality control teams throughout the bureau that had 75 items on achievements applicable throughout the bureau. These things played a fine role in assuring transportation safety, in upgrading transportation efficiency, in improving equipment performance capabilities, and in improving the technical quality of the corps of employees itself.

3. Emphasis on Reform For A Greater Contribution to the Modernization of Electrical Equipment

Since the transportation responsibilities for which the Beijing Railways Bureau is responsible are extraordinarily important, electrification improvements and electrification projects are very numerous. Several problems urgently in need of study and solution exist in the prevention of electrical interference and in consistency and reliability of 25 Hz track circuits between areas and on frequency shifting automatic blocking equipment.

To insure train safety, automatic control techniques for train traffic have been placed on the daily agenda of important things to do. Upgrading and technical improvement of the quality of use of dispatching centralization, dispatching supervision and locomotive signaling equipment will be important.

Electronic computers have now begun to be used to monitor operation of all electric interlocking and hump equipment so as to provide scientific data for a transition to control of repairs. Expansion and promotion of repair control is necessary to bring the level of improvements of the maintenance and repair system to a higher level. Much work remains to be done in the further summarization, perfection and promotion of this system.

Demands on communications equipment result mostly from the rapid rise in volume of information required by the increase in railroad transportation volume and the modernization of control work. Consequently, railroad communications systems have to be able to transmit diverse kinds of information, thereby improving the quality of service. Work on a computer network for the Beijing-Shanghai circuit that was begun more than 2 years ago is without doubt a pilot project for and an integral part of this kind of work.

It has been decided to introduce an optical cable four cluster 140 Mb digital communications network in construction of the Da-Qin Line, and all of the exchange equipment will be 1980's programmable exchanges. Once the Da-Qin Line has been completely built, it will also be China's newest and most versatile integrated digital network (IDN). Plans have already been approved for the communications network on the Beijing-Zhengzhou trunkline where optical cable equipment will be used. All these developments will cause the Beijing Railway Bureau's communications equipment to develop to new heights.

Use of composite train techniques has effectively increased transportation capacity, but it has also brought a series of problems in its wake for the use of electrical equipment. Electrical units will play a major role in perfecting synchronous control techniques for multiple locomotives. Increase in train tonnages and train density will add new factors requiring consideration in electrical maintenance and repair work. Train traffic organizational work will require electrical departments to increase their lateral liaison with other units. All these things require diligent study as a part of reform work. There is bound to be further expansion of electronic computer technology into electrical equipment. Electronic computers are not only a tool for control and monitoring, but they will become the heart of electrical equipment as well.

In today's world in which a new technological revolution has arrived, the railroad sector in all countries is giving serious attention to progress in communications and signaling equipment in the same way that they devoted serious attention in the past to the development of railroad pulling power and railroad construction. Since electrical equipment has increased rapidly in the Beijing Railway Bureau, even though organizations, employees at all levels have put forth great efforts; nevertheless, progress in improving the skills of electrical personnel still lags behind the development of equipment The quality of personnel is far from being able to meet work requirements. There are glaring gaps today in the technical training of electric staff members and workers, in improvement of the vocational training of new employees, in updating knowledge of engineers and technicians, and in improving the managerial skills of managerial personnel at all levels. Consequently, we will have to proceed from China's circumstances and circumstances as they exist on railroads to propose measures for dealing with the realities of the transportation tasks that confront the bureau and the realities that confront development of electrical equipment, and we will have to hasten the modernized building and modernized management of communications and signaling equipment on the basis of what is scientific, advanced, economical and feasible. Today the railroads' electrical departments are bending every effort to improve maintenance and repair work, to rid the railroads, to the maximum extent possible, of all kinds of things that contribute to a lack of safety, and to ensure safety and high efficiency in railroad transportation.

Employees concerned with electrical work throughout the bureau bear a heavy responsibility and have a long road to travel. Every employee concerned with electrical work should bring to bear his intelligence and knowledge on his own glorious work position and make a greater contribution to the modernization of the bureau's electrical equipment.

TRANSPORTATION

ROADS CITED AS PREREQUISITE FOR RURAL DEVELOPMENT

Beijing GONGLU [HIGHWAYS] in Chinese No 9, 25 Sep 85 pp 2-8

[Article by Zhu Xuewen [2612 1331 2429] and Zhu Hong [2612 4767]: "Marked Changes Needed in Highway Conditions During Seventh 5-Year Plan"]

[Text] Dramatic changes occurred in the development of China's national economy and society following enunciation by the 12th CPC Central Committee of the magnificent strategic goal of quadrupling the gross output value of industry and agriculture by the end of this century, and the two stage strategic plan for achieving this goal. Output of China's industry and agriculture has grown tremendously in recent years. Commodity production has developed rapidly; large numbers of village and small town enterprises and all sorts of specialized households and economic partnerships have come into being; the income of 800 million peasants has risen tremendously; and the rural economy has begun to develop in the direction of specialization, commodity production and modernization. Reform of the economic system centering on cities, and further implementation of a program to "enliven the domestic economy and to open the country to the outside world;" and acceleration of the building of special economic zones and the establishment of open cities and of open economic zones along the coast have sparked development of the inland economy. These multi-level strategic economic development plans that have gradually swelled from the outside to the inside and from the seacoast to inland areas have placed heavy burdens on passenger and freight transportation. Nowadays, there is an urgent need for quick, direct, readily available, safe and comfortable modern highway transportation between cities and the countryside, between one city and another, and between the coast and the heartland. Peasants, specialized households and village and small town enterprises all want to buy various kinds of special purpose motor vehicles that are fuel efficient, comfortable and produce high benefits. They want highways to go into rural villages to provide the peasants with inexpensive, good quality and readily available transportation. Quite a few places want to build high quality highways and high efficiency trunk highways that can open markets for ever increasing supplies of products, that can satisfy needs in carrying out large scale socialized production, and that can satisfy the steadily increasing needs of the people, and particularly the needs of 800 million peasants, for industrial manufactures, science and technology, culture and education. This trend presages a new stage of development of China's highway transportation.

For a long time, neither theory nor practice in economic planning has addressed the issue of transportation having a role in advancing and restricting socio-economic development of the whole country, and the need to build highways first as a precursor to rural development. Consequently, within the transportation and communications system there has long been an emphasis only on railroads to the neglect of the role of highway transportation. There has been a failure to realize that highway transportation is not only closely related to railroads in the communications and transportation system, but that in inland areas and in remote provinces and regions, once the commodity economy has progressed to a certain extent, highways play a major role as trunklines,and that highways and railroads are mutually complementary and jointly constitute a complete transportation system. Investment in highway transportation has been cut repeatedly with the result that the highways are extremely antiquated and there is no dovetailing of the various forms of transportation. This has meant greater gaps and more striking contradictions in a communications and transportation system that was not adequate to begin with.

How to make use of the favorable circumstances provided by opening to the outside world and reform, to abide by the law that transportation has to come first, and to build a transportation industry is a strategic key to China's quadrupling of the gross output value of industry and agriculture by the end of this century.In recent years, leading comrades on the Central Committee have pointed out repeatedly the need to readjust the pattern of transportation, to hasten the building of highways, to increase the proportion of highway transportation and to make use of the transportation network's overall transportation capabilities. Most recently, Premier Zhao pointed out once again that change in the pattern of transportation is a guiding program in building the country during the Seventh 5-year Plan. The proportion at which the transportation system should be maintained in the national economy, the reciprocal role of various modes of transportation and the laws governing their interdependence bear on strategic goals, the pace and the programs and policies for development of China's transportation. These are matters that await study and decisions by the authorities concerned. This article only proposes some exploratory views on how to proceed with highway construction and the level to be attained during the Seventh 5-year Plan.

1. Readjustment of Transportation Patterns Requires Acceleration of Highway Construction

1. Status of and Problems With China's Highways

China's highway transporation system today lags half a century behind that of advanced countries in Europe and the Americas. Highways are China's weakest link. During the 1950's, China devoted serious attention to the development of its transportation, making highway construction a strategic action for strengthening national defense. Highway construction was made a part of state capital construction plans, and investment in highway construction amounted to approximately 3 percent of total investment in capital construction nationally. The building of national trunk highways was centrally controlled by the state. Under aegis of this policy and system, national trunk highways were built between Chengdu and Laoyingyan, Baoji and Chengdu, Sichuan Province and Guizhou Province, Chongqing and Xiaguanying [Gansu], Sichuan Province and the Xizang Autonomous Region, Qinghai Province and the Xizang Autonomous Region, Fuzhou and Wenzhou, Shenyang and Mudanjiang, and Weixian [Shandong] and Shijiazhuang [Hebei], which remain mainstays among the country's highways. During the late 1950's, authority to build highways was transferred to a lower level and for the past 20 or more highway construction has had to depend on road maintenance funds collected by individual jurisdictions to maintain simple reproduction, plus some national border defense funds, construction work done by civilian laborers, and operation conducted by the local people with subsidies from the state for partial improvements and upgrading. After the 12th CPC Central Committee made the building of transporation to carry energy a strategic focus, only railroads and seaports received attention and highway construction still had no place in line among national capital construction plans. During the Sixth 5-year Plan period, highway construction remained dependent on approximately 1.3 billion yuan in national border defense funds and on a small amount of local investment; however, approximately 2.3 billion yuan of funds for energy capital construction were taken out of road maintenance expenditures. During the Sixth 5-year Plan, highway distance for China as a whole averaged an increase of approximately 10,000 kilometers annually. This was lower than the historical average annual increase of between 20,000 and 30,000 kilometers annually. Standards for improvement of highway quality were maintained at those of the Fifth 5-year Plan period or slightly lower. As of the end of 1984, 38 percent of the nation's 920,000-odd kilometers of highways were substandard highways that did not meet technical standards; 47 percent were minimum standard single lane rudimentary highways, and 13 percent were dual lane highways able to accommodate only old medium size motor vehicles (4 ton Liberation trucks) for the most part, and a mixture of all sorts of vehicles traveled over them. Only 20 percent of the total highway distance was surfaced roads that markedly conserve fuel and lower transportation costs, and except for a small number of asphalt surfaced roads, an overwhelming majority of these had a 2 to 3 centimeter thick oil waste topping. Moreover, more than 60 percent of these had been used for longer than the period for which they were designed and were urgently in need of patching and improvement. There are more than 5,000 townships and more than 260,000 rural villages (or production brigades) in the country that have no roads. On trunk highways, there are more than 200 fording points that have no bridges; more than 4,000 kilometers of roads simply dead end, and 1,000 bridges an estimated more than 40,000 linear meters long are urgently in need of improvement. Ninety-two percent of the 620,000 kilometers of county and township highways are substandard for minimum standard fourth class highways, more than half of which are unsurfaced or have been topped with a simple mixture of mud and crushed stone that cannot be traveled in all kinds of weather. Once rural villages carried out reform of the economic system and promoted contract responsibility systems linked to output, as grain yields rose somewhat and rural commodities increased slightly, difficulty finding transportation, difficulty in boarding buses, and blocking of the flow of commodities occurred in cities and the countryside everywhere.For example, a bumper corn crop in northeast China required the outshipment of 22 billion jin annually; however, high costs made highway transportation undesirable, neither railroads going southward past the Great Wall nor seaports had the necessary handling capacity and highways going to and from ports and railroad stations were not able to concentrate the corn on the one end and distribute it at the other. As a result, arrangements could be made to ship only slightly more than 6 billion jin. More than 10 billion jin of corn is added to storage annually and the cost of storage runs to between 1.7 and 2 billion yuan. Moreover, if the grain remains in storage for more than 3 years, it spoils. It cannot be eaten, much less exported.

Another example occurred in Shanxi Province, China's major coal production base. The Taiyuan - Shijiazhuang Highway is one of the main thoroughfares for shipping coal out of Shanxi, carrying approximately 20 million tons annually. Guiguan in Pingding County on the Taiyuan-Shijiazhuang Highway is the "eastern gateway" to Shanxi Province, and the distance between Pingding, the county seat, to Jiuguan is 37.5 kilometers over a third class highway through a mountainous region that was built in 1969 and that was substantially able to handle the volume of transportation up until 1978. From 1980 onward, Shanxi's outshipments of coal gradually increased, and the volume of traffic over the highway between Pingding and Jiuguan shot up from 4,000 vehicles per day to 10,000 vehicles per day, and sometimes going as high as 15,000 vehicles per day. This was more than five times the maximum volume of traffic that a third class highway is able to carry. Since the road was narrow and vehicles numerous, accidents were numerous and the road was frequently blocked. During November 1983 alone, the highway was blocked more than 30 times. This included a serious traffic jam accident at Jiuguan in which more than 10,000 vehicles were blocked in the foothills of the Taihang Shan for 2 days and 2 nights. Authorities estimate a decreased output value of between 1.1 and 1.5 billion yuan from production enterprises attributable to traffic jams during 1984, and a 20 million yuan reduction in earnings of motor vehicle transportation enterprises.

Another example is in the golden delta region of the Chang Jiang from Shanghai to Nanjing where there is no through highway to connect Suzhou, Wuxi and Changzhou in China's most developed region. Most of the more than 300 kilometers of existing highways are of third or fourth class standards,and some road sections dead end and permit the passage of vehicles only with difficulty. Vehicle speeds average only 30 kilometers per hour making it impossible to reach one's destination after traveling all day long.

The foregoing situations show that highway transportation is already unable to keep up with development of the rural commodity economy, with needs for the transportation of energy or with the opening of the country internally and externally.

2. The Role of Hastening Highway Construction Under New Circumstances

(1) Development of the rural commodity economy and readjustment of the structure of agriculture have placed higher requirements on transportation.

Reform of the rural economy has destroyed the longstanding stagnation of agricultural production in China, and emancipated the country from the shackles of the traditional self-sufficient or semi self-sufficient economy in a transformation toward large scale commodity production and modern agriculture. The gross output value of agriculture increased by an average 7.9 percent per year from 1979 through 1983, and in 1984 gross output value was 14.8 percent higher than in 1983. The average annual increase in gross output value was more than double the 3.2 percent per year for the 26 year period from 1953 through 1978. Grain output increased 100 million tons in 6 years, output breaking the 400 million ton mark. Output of cotton, oil-bearing crops and sugar crops more than doubled. Very great increases also occurred in output of other cash crops and agricultural sideline products. Furthermore, village and town enterprises developed even more rapidly. Today, there are 1.35 million township and town enterprises throughout the country with a gross output of 150 billion yuan. Peasant income has also risen from the 134 yuan of 1978 to 355 yuan. In Wuxi County in Jiangsu Province, for example, commune member income was 709 yuan per capita in 1984. Expansion of agricultural production has spurred changes in the structure of industry. A large part of the workforce has been emancipated from farming to work in industry and business, in construction, in transportation and in the service trades. According to 1984 statistics for 25 provinces and cities throughout the country, 14 percent of all peasant households were specialized households, the percentage of such specialized households engaged in non-agricultural production having risen from 25 percent in 1983 to 33.6 percent in 1984. The commodity rate for agriculture increased from the 35.6 percent of 1978 to 53.3 percent. As a result of expansion in the circulation of rural commodities, the exchange between cities and the countryside has burgeoned and rural passenger and freight transportation has risen rapidly in recent years. It has been calculated that 2 billion tons of goods moved over rural highways in 1984 and that passenger travel amounted to between 2.5 and 3 billion people for an increase averaging more than 15 percent per year. A random sampling of three 100 million yuan villages in Jiangsu Province showed that peasants traveled on a modern means of transportation 29 times a year, 24 times by motor vehicle. Clearly, as the rural economy develops, high speed growth of highway passenger transportation is taking place. To make up for the shortage of transportation in the country, since 1983 individuals have been encouraged to buy motor vehicles for the transportation and sale of agricultural and sideline products and for short distance passenger transportation. Rural households specializing in transportation have to transport so as to make a living, and they have become an important integral part of specialized rural production households. Statistics show nearly 350,000 motor vehicles in rural villages as of the end of 1984, or five times the 1978 figure. In 1985, the state drew up another 10 policies for further enlivening of the rural economy that call for the use of a certain amount of financial and material resources to support development of processing industries for agricultural products in principle grain producing areas, and for support of the development of animal husbandry, the aquatic products breeding industry and forestry. These policies encourage development of mining, livestock feed industries, the food industry and operation of tertiary industries. At the same time, more urban industry and technology has been transferred to the countryside, to townships and towns,thereby linking more closely the economies of cities and the countryside. For a fairly long time to come, the need for rural transportation and exchanges between cities and the countryside will continue to grow rapidly, an the volume hauled will also rise steadily. The state will sell motor vehicles directly to peasants in 1985, and it is anticipated that large numbers will be sold in the future. Once there are a large number of motor vehicles, the peasants will become dissatisfied with the roads. Once roads have been improved, not only will travel be more convenient, but vehicle speeds will increase and transportation costs and waste of materials will decline greatly. This will stimulate development of the rural economy in turn. Take the situation in Zuoyun County in northern Shaanxi, for example, where income in 1978 averaged only 78 yuan per capita. During the past several years, this county has emphasized the development of transportation, so that virtually every village is accessible to motor vehicles. It also developed a mining industry and the growing of cash crops. Now income averages 820 yuan per capita making it one of the richest counties in the whole country in terms of per capita earnings.

Another example is the several 100 million yuan townships in Wuxi County where rapid development took place only after highways had been built. Qianzhou Township, notorious throughout China, was known prior to 1976 for being backward in three ways: It was backward in transportation, having no roads; it was backward in agricultural production, having no mechanization; and it was backward in that its grain yields and distributions to its commune members were among the three lowest of 36 townships and towns in the county. To bring about a change in its backward condition, between 1970 and 1977 the Qianzhou Village CPC Committee and township government began to organize the 21 production brigades in the township, a workforce of nearly 10,000, in the construction of 35 kilometers of new rural roads, 7 kilometers of trunk highways and 237 bridges totaling 2,844 linear meters in length. By 1980, 21 villages were accessible to motor vehicles; tractors could move around from one brigade to another, and the township set up a motor vehicle transportation unit. Development of highway transportation gave powerful impetus to the development of rural industry. In 1970, output value of industry for the whole township had been only 1.53 million yuan. In the 7 year period between 1978 and 1984, the output value of industry grew by approximately 31 percent each year reaching 156 million yuan in 1984. In a period of 7 years, the township's industrial output value increased 5.6 fold. Four major changes had taken place as follows: First was a major change in agricultural production conditions. Second was a major change in industrial production conditions. Third was a major change in transportation conditions; and fourth was a major change in the standard of living. Today the masses expectations are for "nutritious food, spacious housing, pretty clothing, high quality products for use in daily life, and convenient transportation." Qianzhou Township's change from being backward in three ways to four major changes, and Zuoyun County's change from poverty to riches is attributable primarily to resolute implementation of the line, programs and policies of the 3d Plenum of the 11th CPC Central Committee, and the carrying out of reform of the rural economic structure. This has been a great victory for the Party's rich peasant policy. Nevertheless, objectively speaking, for the rural commodity economy to develop, transportation has to come first. It is particularly necessary to provide safe, convenient, on time, and door-to-door direct transportation between cities and the countryside to satisfy and promote all-round development of rural trade, industry and agriculture.

(2) A rapid and direct transportation network that links areas both internally and with other areas is urgently needed for development of economic zones centering around large cities and for development of coastal areas open to the outside world. The blocked economy that existed for many years in which

political and business matters were intermixed and central and local authorities were cut off from each other shackled development of the country's productivity. Reform of the economic system was for the very purpose of changing this rigid economic pattern into an open multi-level network economy that would increase the vitality of enterprises, promote a specialized and cooperative division of labor, and hasten development of the economy. But this could not be done without a developed transportation system. Take the Shanghai economic area, for example. This economic area has a population of nearly 200 million, and the output value of its industry and agriculture is one-fourth the total for the whole country. The area has 14 large cities, a galaxy of human talent, a plethora of institutions of higher learning, and plentiful scientific and technical forces. It has five port cities that open to the outside world and the Chang Jiang delta open economic zone that ease the importation of foreign investment and technology. It has a developed industrial foundation and agricultural and sideline products bases, richly endowed coastal areas and territorial seas, plus coal, iron and non-ferrous metals from Anhui and Jiangxi provinces. On the other hand, sole reliance on water transportation and railroads to bind together organically Shanghai and the 30-odd large and medium size areas in the area as well as the farflung countryside, township and town is grossly inadequate. High speed highways between Shanghai and Nanjing and between Shanghai and Hangzhou as the backbones of a system for linking the major cities in the area with the major parts in a high speed trunk highway system is indispensable. Such a system could link city and rural roads in all directions; could help link large and medium size cities with each other; and could link all the open cities, ports along the coast and along the rivers with the hinterland to spark the development of northern Jiangsu, Anhui, Jiangxi, and Zhejiang provinces. The interlinking of water transportation, rail transportation and civil aviation, each performing the task it is best able to perform, could markedly improve fairly rapidly transportation conditions throughout the region. A rapidly growing open style, network-like Shanghai economic area would become a turnkey vigorous all-round development of China's economy.

(3) Division of transportation between highways and railroads, each performing the task it is able to do best could fairly quickly upgrade overall transportation capabilities and benefits from the entire transportation system, and would ameliorate the chronic transportation shortage. Furthermore, improvement of highway conditions is a prerequisite for making the most of the advantages that motor vehicle transportation provides. China's poor roads, the backwardness of the way its vehicles perform and inequities in transportation prices have forced on to the railroads large amounts of freight and passengers traveling intermediate and short distances that might better have been carried by highways. Since 1983 attention has been devoted to having part of the flow carried by highways, and as of the end of 1984, more than 500 road transportation routes to carry part of the flow had been established, and they carried 400,000 passengers a day. This was more than one-tenth the volume of passenger traffic carried by the railroads. Highways played a very good role. Road transportation potential is still a long way from being used to the full, however. Statistics show road passenger transportation as being approximately 20 percent of railroad passenger transportation in terms of ton kilometers, and road traffic capacity as being between 40 and 50 percent that of railroads. Forecasts calls for a quadrupling of the volume of passenger

transportation for China as a whole by 1990, and an approximately 60 percent increase in the volume of railroad passenger transportation as well. Furthermore, some of the busiest railroad passenger lines are trunklines for hauling coal, so the need to ensure that coal is hauled will make difficult the addition of more passenger trains. Expansion of train classification is a good method of increasing traffic, but the increase in carrying capacity would be able, at best, to satisfy only about one-half the need for additional transportation. This transportation capacity could best be used for the hauling of passengers a distance of 200 kilometers or more. Much of the intermediate and short haul passenger transportation should be shifted to highways. Passenger travel 800 kilometers or farther should be handled partly by civil aviation as part of a fundamental plan for solving travel difficulties. In 1984, the railroads refused 1,215 pieces of loose freight. They stopped running 53 express trains with only a few cars, and thus increased line capacity by scores of millions of tons. Were highways paralleling busy railroad sections to be improved and further use made of the role of highway transportation, it has been roughly estimated that the increased railroad transportation capacity would be equal to that of two Da-Qin [possibly Dalian to Qinhuangdao] lines, and capable of hauling more than 60 million tons of coal from Shanxi, Shaanxi and Henan to east China. Not only would this greatly alleviate the transportation shortage, but direct benefits for the economy would be considerable.

(4) Development of the provinces of south China urgently requires building of new transportation trunk lines. Only if highways lead the way can this problem be solved fairly quickly.

Economic development in the eight provinces of Sichuan, Yunnan, Guizhou, Hunan, Guangdong, Guangxi, Fujian and Jiangxi is lower than the average for the country as a whole except in the Zhu Jiang delta. In Jiangxi Province, which neighbors Jiangsu Province, per capita national income is less than half than of Jiangsu Province. To bring about gradual change in this backward situation in the economies of these regions, solution to the problem of a lack of readily available transportation is necessary first of all, with the carrying out of a development strategy whereby coastal areas give impetus to inland areas. The present population of these eight provinces is approximately 380 million, or 36.7 of the national total. They have approximately 13,000 kilometers of main railroad lines, or only 22 percent of the national total. Since line standards are low, the annual volume of freight hauled is less than 16 percent of the total for the country. These provinces have 41 percent of the highway distance in the country. Though this is no small percentage, most of it is not up to standards. These provinces have only 18,000 kilometers of first, second and third class roads, or 13 percent of the national total. They have approximately 45,000 kilometers of shipping routes, but few of them have been maintained except for the Chang Jiang, and they are underutilized. It is understandable that the people of this region earnestly hope that a railroad will be built; however, problems in building railway projects in mountainous areas are daunting; construction costs are high; and a lot of time is required to build them. Over the near term, the building of transportation within the country should focus on improvements. Even if planning is done during the mid and late 1990's, it will be difficult to put plans into effect by the end of the 20th century. Another matter is that the investment required for building a railroad with an annual traffic volume of 5 million tons or less is not cost effective. Therefore, the policy for building transportation in this area should make full use of the navigation of the two great river systems of the Chang Jiang and the Zhu Jiang, and highways should come first when land transportation trunk lines are to be built. Transportation lines for exports have to be built in the near future for Yunnan, Guangxi and Guizhou provinces and for southeastern Sichuan, to create conditions for development of the Wuling Shan region where these four provinces meet. Jiangxi Province has to be linked closely to Shanghai and to the Chang Jiang and coastal open economic zones. A circumferential highway should be build around Hainan Island in order to hasten development of the island. If construction of these highways is completed during the Seventh 5-year Plan period, it will be possible to lay a fine foundation for vigorous building of the province of south China during the following decade.

(5) Strengthening of national defense in border regions, the building up of borderlands, and development of the economy of minority nationality areas requires the building of a corresponding transportation system.

Most of China's border regions are inhabited by minority nationalities. Not counting the provinces of southwest and northeast China, the area of Xinjiang, Xizang, Nei Monggol, Ningxia, and Qinghai totals 4.84 million square kilometers, or one-half the total for the whole country. Population is more than 42 million, or 4.2 percent of the national total. In 1983, the gross output value of industry and agriculture in these regions was 27.6 billion yuan, or 3 percent of the national total. It may well be said that the land is vast and the population scant; the economy is also fairly backward. Despite the limitations of the region's national economy over the short term, since its resources have yet to be completely surveyed, large scale development cannot be undertaken. Moreover, the potential of its underground treasures and of the land awaiting development is very great. it is a vast field for future economic development. This region's transportation is characterized by long distances and a small volume of traffic. Thus, it is suited to the development of air transportation. Except for the movement of coal by railroads and of petroleum by pipelines, land transportation should consist primarily of the development of high tonnage trucks and truck trailers. A combination of highways air transportation needed for national defense should be used to developed a highway and air transportation system for use by both the armed forces and the civilian sector.

2. The Distribution of Highways in the Overall Transportation Network

The building and distribution of highways must proceed from needs in developing the national economy. In the planning and allocation of investment for a transportation network, likewise the role of highways should be accorded the position it deserves.

Highways can go to industrial plants, to mines, to rural villages, to cities and towns and to the various places where people carry on production and daily life. Consequently, they have always been termed ribbons that link city and country, and they are also branch lines on which railroads, water transportation and air transportation rely for the concentration and distribution of passengers and freight. They are like the capillaries in the human body, which though small are indispensable. But, it is not enough that our understanding halt at this level. The changes that have taken place in the structure of transportation in Japan and western Europe ever since the 1950's, with highway transportation surpassing railroad transportation, have positively not been because of the small land area of these countries. Rather they reflect socio-economic development to a certain stage, and they result from changes that have taken place in the industrial structure and people's social lives. Some comrades suppose China to be a continental country with a vast land area in which the structure of transportation should continue to be railroads for the most part. Admittedly, since distribution of the country's natural resources and its economic development are uneven, the hauling over long distances of minerals such as coal and iron and of large quantities of freight necessitates reliance on railroad and water transportation.Yet viewd from another angle, this is not the whole story. First of all,a look at the movement of passengers, one of the two major functions of transportation, shows the percentage of passengers carried by railroads to be declining gradually while the percentage carried by highways is rising rapidly. Passenger turnover for railroads is declining at about 1 percent per year, while it is rising 2.4 percent for year for highways. It is anticipated that by the end of the 1990's, highways will carry more passengers than railroads to become the number one mode of transportation. There is a shortage of passenger transportation now, but it will grow at high speed in the future. Railroads will expand the classification of passenger trains increasing the number of cars from 17 to 20 to increase the number of passeners carried by trains. This will moderate some of the shortage of long distance passenger transportation. But primary reliance on railroads will be unable to solve this problem. This is not solely because there is a limit to the number of passengers railroads can carry. More importantly it is because passengers will take up a large part of railroad lines' traffic capacity, and reliance on railroads to solve the passenger transportation problem is not cost effective nor does it make sense in terms of the use of transportation capacity or in results from investment. It is necessary to make use of the overall transportation capacity of the transportation network, to accelerate use of airlines and to make use of passenger transportation on the Chang Jiang and along the coast. This will require highway transportation to assume a greater role in passenger transportation. In sections of railroads where passenger transportation is short, in particular, highways can take over responsibility for passenger transportation to a distance of 200 kilometers or less. Second, looked at in terms of economic development, transportation of the country's main source of energy, coal, relies primarily on railroads. Two-thirds of China's coal output is hauled by railroads, and railroad transportation is certainly extremely important for this purpose. But, how can the railroads be made to haul more coal? The railroads intend to run heavy duty combined trains, to increase the percentage of ganged through trains, to reduce intermediate stops, and to carry less short distance and odd lot freight. To take these actions without coordination with highway transportation will not do. Because highway transportation provides rapid service directly to intended destinations, produces little damage or losses, with improvement of highways and truck performance, it will rapidly become economical for transportation over long distances. With the rapid development of medium size and small enterprises and of small cities and towns, as well as of economic zones that depend on large cities, and particularly for coastal areas and areas open to the outside world such as the Shanghai Economic Zone, for Liaodong, the Shandong promentory and their hinterlands, for the special economic zones in Guangdong and Fujian provinces, and for the Beijing, Tianjin, Hebei and Shanxi areas, highways serve not only as capillaries in the structure of their transportation systems, but also play a role as major transportation trunklines cutting across administrative zones. Our overall planning for a transportation network has to rid itself of the shackles of longstanding traditional concepts of a blocked economy. It has to become emancipated from a transportation structure used primarily for the transportation of raw materials and primary products, focusing instead on how better to use and improve the movement of people and goods and to upgrade transportation efficiency and quality. If these points are ignored, our planning will lag behind the needs of the times.

On the basis of the foregoing appreciation, we believe that the pattern of highways in the overall transportation network as well as the planning and building of them has to take full account of the following three matters:

(1) A local road system that has as its primary function the linking together of cities and the countryside and medium size and small cities, this system to include all county and township roads plus most provincial and municipal trunkline highways. This system would be strongly local in character, with provinces (or cities and autonomous regions) being responsible for planning and organizing it. To accomplish this, provinces (cities and autonomous regions) would have to be assured sufficient financial and material resources.

(2) A national trunk highway system that connects large and medium size cities plus major ports and airfields, and that forms, together with railroads, a joint land transportation transportation trunkline network. This would include existing national highway trunklines plus some highways for the hauling of coal for distribution of goods from ports, and the building of highways. This system would be centrally planned and organized by the state. When state funds are inadequate, consideration could be given to joint investment by the central government and local governments; however, it would be necessary to make sure that local governments would not have to provide too much investment, otherwise local governments' construction and improvement of local highways would be adversely affected.

Over the short term, highway construction should be concentrated in economically developed areas fanning out from large and small economic centers and radiating from the seacoast inland. It would include the building of major trunkline highways of decisive importance to regional development such as the Beijing-Tanggu and the Guangzhou-Shenzhen expressways, and the improvement of trunk highways that parallel railroads or highways that directly link large and medium size cities and that are markedly deficient in providing good transportation over distances. It would include improvement of service. Trunklines carrying a high volume of traffic would have to solve problems in the mix of freight and passenger transportation and operate fast and slow trains on different tracks. In provinces that have not yet been developed, new trunk highways should be built.

(3) In frontier areas (notably Xinjiang and Xizang), a transportation system should be built that consists primarily of roads and airlines that is closely linked to national defense needs but that is used by both the armed forces and the civilian sector for national defense and economic purposes.

3. Scale of Road Construction During the Seventh 5-year Plan

In view of the objective of quadrupling of the country's gross output value of industry and agriculture by the end of this century, and strategic planning calling for two steps to achieve this goal, by how much should road transportation multiple? What level should the building of roads achieve for a balance among all modes of transportation, to build overall transportation capacity, to satisfy needs of society and of production, and to insure planned coordinated development of the national economy? On the basis of major economic indicators for this century, through reference to historical development and to road traffic volume and production created as a result of industrialization in foreign countries and to proportional relationships among the various needs of society, and through taking into consideration the new transportation situation brought about by changes in the structure of industry and in the regional economic structure as a result of reforms and opening to the outside world, authorities have predicted road traffic volume will reach more than 20 billion tons by 2000. This will be a five fold increase or more over 1980. If road transportation is looked at in terms of a moderate level of service, average vehicle speeds on trunk highways will be 50 percent higher than at present reaching 46 kilometers per hour, and average vehicle speeds over the road system will increase by one-third reaching 37 kilometers per hour. Virtually every township and town will be served by roads. On the basis of these speeds and percentages, between 1.2 and 1.5 million kilometers of roads will be needed for the whole country. This includes 15,000 kilometers of expressway and first class roads, between 100,000 and 110,000 kilometers of second class roads, and between 400,000 and 500,000 kilometers of third class roads or one-third of the total road distance. Between 450,000 and 500,000 kilometers of road will have high grade or secondary grade surfaces. This will require an investment of between 165 and 170 billion yuan at current prices and costs. The crux in exceeding this goal will be funds. We should neither onesidedly emphasize a shortage of funds as a reason for not going ahead with transportation first, and building roads as the first form of transportation, nor should we do more than national financial and material resources permit. We have to take into consideration the national shortage of funds, use limited funds where they will do the most good, and make sure that they are invested in the building of key road projects that are urgently needed and from which quick results can be obtained from small investment so as to derive the most social benefit as early as possible.

Strategic plans for development of the national economy call mostly for the laying of a good foundation, the husbanding of strength and the creation of conditions during the first 10 years of the last two decades of this century to enter a period of vigorous new economic construction during the last 10 years. Road construction should likewise be done in two steps. During the first 10 years, efforts should be devoted to turning around the shortage of road transportation; during the second 10 years, efforts should go to opening up new areas to road transportation. But, 5 of the first 10 years have already passed without any change for the better in the backward state and short supply of roads. On the contrary, the situation has worsened. Firm grip has to be taken on the fine opportunity and the crucial period provided during the remaining 5 years to make sure that during the Seventh 5-year Plan period that simultaneous with looking after increased needs for current years, consideration will also be given to paying up the debt that has accumulated over the years as a result of the shortchanging of road transportation. Then, during the last 10 years, it will be possible to enter a new period of vigorous economic growth in which needed transportation capacity will be made ready, thereby laying a good foundation to meet the needs of the national economy. On this basis, in 1990 roads in should be able to handle between 9 and 10 billion tons of freight (including between 2.5 and 3 billion tons of rural freight), and between 8.5 and 9.5 billion passengers (including non-collective enterprises). By the end of the Seventh 5-year Plan, the country should have approximately 1.1 million kilometers of roads. But, inasmuch as there will be a shortage of funds and materials for investment in road construction during the Seventh 5-year Plan, and since time will be needed for preparatory work during the previous period and there will be a shortage of technical equipment. the policy to be followed should be mostly one of a combination of improvements and new construction with improvements being paramount. Emphasis should be on improving the traffic capacity of key economic trunk highways, on improving busy roads for the transportation of energy from energy bases and for distribution of freight from ports, stations and open cities, branch roads connecting to railroads and roads carrying goods into and out of large and medium size cities. Various methods should be used to build county and township roads and to hasten road construction in impoverished areas. By the end of the Seventh 5-year Plan period, road distance for the whole country should be a minimum of 1 million kilometers.

There should be 5,000 kilometers of expressway and first class roads. An estimated 5,000 kilometers of expressway and first class road sections should be built that are able to accommodate 5,000 vehicles per day. By the end of the Sixth Five-year Plan,, the country should have 500 kilometers of first class roads; by the end of the Seventh 5-year Plan, it should have 2,000 kilometers, with another 2,500 kilometers being constructed over a period of time as local conditions require. Some areas can build roads in sections, while other areas can take over land at a single time to build two way roads for the sole use of motor vehicles after which they can build additional roads as transportation volume increases.

There should be 40,000 kilometers of second class roads. By the end of the Sixth Five-year Plan, there should be 20,000 kilometers of second class or better roads. Analysis shows that where the volume of mixed kinds of traffic reaches 3,500 vehicles per day, the road should be improved to second class standards (this is a minimum standard). We believe that this can be entirely attainable with effort.

There should be 180,000 kilometers of third class roads (including some high traffic county and township roads). Road sections on which traffic volume reaches 1,000 vehicles per day and night should generally be improved to third class road standards.

Efforts should be made to put a high quality or second quality surface on 300,000 kilometers of roads, depending on availability of materials. Where traffic volume per day and night reached 500 vehicles, by the end of the Seventh 5-year Plan between 350,000 and 400,000 kilometers should be roads with an oil residue topping. Since both funds and materials will likely be insufficient, some macadam roads carrying 500 vehicles per day and night will not be improved.

There should be 700,000 kilometers of county and township roads. On road sections where traffic volume reaches 1,000 vehicles per day and night, every effort should be made to build third class roads. Where conditions permit, additional third class roads should be built.

Twenty-eight new free-standing large bridges totaling 37,000 linear meters should be built (including rebuilding of some dangerous bridges).

If this goal is achieved, by the end of the Seventh 5-year Plan 80 percent of all roads will be able to carry a substantial volume of traffic, and average speed on trunk highways will reach 41 kilometers per hour. Transportation costs will be lowered by approximately 12.5 percent (not counting vehicle replacement or structural changes). Figured in 1990 terms, the newly added 100,000 kilometers of roads surfaced with oil residue should save 500,000 tons of gasoline (or diesel fuel) that year. Ninety-five percent of China's townships and more than 85 percent of its villages will be served by roads.

The following several ideas are suggested for gathering road construction funds to hasten road construction:

1. Appropriate increase in the collection of fees for road maintenance and expansion of the scope of collection.

To insure a steady source of income for road construction over a long period of time, in addition to the collection of road maintenance funds should be the collection of a vehicle purchase surcharge on all purchases of motor vehicles by units or individuals including national organizations and the armed forces.

3. State investment in road construction should, at minimum, be at the same level as the energy transportation fees that the state collects from road maintenance fees.

4. A system of "civilian operation with public support and construction by civilian labor" should be instituted under leadership of government organizations at all levels, the state providing subsidies, local jurisdictions gathering together funds, and the masses performing labor. Local amassing of funds is to include local jurisdictions help in taking over land, razing and moving of structure, payments for labor, and payments of funds from local treasuries.

5. Emphasis should be placed on preparatory work for projects, active efforts made to incorporate projects into state intermediate term and longterm plans and annual plans, with interest-free and uncompensated loans being made.

6. Collection of fees for newly built large bridges, expressway motor roads and tunnels.

7. Reform of the system to allow for placement of tenders, contracting and use of new techniques; measures for bolstering project construction and management of construction, and lowering of project costs.

If it is possible for the state to find the funds somewhere, it is hoped that more roads can be improved and upgraded so that road conditions will change markedly during the Seventh 5-Year Plan.

CHINESE MEDIA ON FOREIGN ECONOMIC AFFAIRS

ON SUCCESSFUL ECONOMIC DEVELOPMENT IN HONG KONG, ELSEWHERE

Guangzhou GANG AO JINGJI [HONG KONG AND MACAO ECONOMIC DIGEST] in Chinese No 9, Sep 85 pp 10-16

[Article based on lecture by Chen Kunyao [7115 0981 5069], director of the Asian Studies Center of Hong Kong University: "Experiences of the 'Four Small Dragons' in Economic Development and Problems in Special Zones"]

[Text] The economies of Hong Kong, South Korea, Taiwan and Singapore have developed very fast during the past 20 years. Because they have many similarities and have had a similar pattern of development, they have been termed the "four small dragons." China with its large land area cannot emulate the "four small dragons;" however, if China is discussed in terms of very many regions such as economic zones, then it is similar in many ways to the "four small dragons." Both Zhuhai and Xiamen resemble Hong Kong and Singapore, and one can examine experiences in their development. Therefore, to look at China in terms of the countries and regions that make up the "four small dragons" still has certain advantages.

1. Four Stages of Industrialization

When talking about modernization, we frequently consider industrial development to be modernization. Good performance in industry entails going through many different stages, which may be divided into the first phase of import replacement, the second phase of import replacement, the first phase of export guidance and the second phase of export guidance. In making these distinctions, we do not mean to say that economic development in every country has to go through these stages; yet, one can look at a place's industrialization in terms of different stages. The traditional explanation has been that in the process of developing industry, there has to be import replacement. During the first phase of import replacement, labor intensive industries develop. Imports consist of labor intensive ordinary industrial goods such as raw materials and machinery. During the second phase, it is also unnecessary to import the means of production; one also has to produce them oneself. Comparatively speaking, a country does not necessarily benefit more from producing the means of production or machinery; therefore, it becomes increasingly difficult to carry out the second phase of import replacement. No matter how much a country lags behind in natural resources, it can still benefit in some ways more than others at any given time. This is the traditional method of industrialization.

Later on, however, there is yet another industrialization possibility, namely export guidance, by which is meant production of some simple, labor intensive industries, exporting to foreign countries, earning foreign exchange in return, and using the foreign exchange to buy other things. Since the question of comparative interest initially is still the operation of some labor intensive industries, this is the first stage of export guidance. Later on when your foundation has become firm, you can engage in some technologically intensive industries. This is the second phase of export guidance.

Hong Kong is a tiny place completely lacking in conditions for import replacement. Import replacement requires a very large internal market. During the initial phase of industrialization, Hong Kong's population was about 2 million--a very small market--so Hong Kong could not engage in import replacement. Hong Kong began with the third stage (the first phase of export guidance). Singapore differs from Hong Kong in many ways. For a time, Singapore practiced import replacement. Of course, Singapore has an even smaller population than Hong Kong, so it planned on uniting with Malaysia to form a federation, but that did not work out subsequently, so it separated from Malaysia. So it is still like Hong Kong in that it began with the first phase of export guidance. South Korea and Taiwan are somewhat different cases. They are a little larger, so they can engage in import replacement. Taiwan began industrialization in the 1950's, and South Korea began industrialization during the early 1960's. They both began with the first phase of import replacement. If you are going to replace imports, you have to use very many government policies, because during the first phase of industrial development you cannot compete with goods imported from outside. One simple method is to collect high customs duties to jack up the price of imports, carry out protectionism, and protect one's own industry. This is a policy for import replacement; there is no other way. Protection now raises costs of one's own products and temporarily sacrifices the interests of consumers. But viewed in long-range terms, protection of one's own industry also has definite advantages. Consequently, during the 1950's and 1960's, South Korea and Taiwan engaged in this kind of protection. They made very simple industrial manufactures and imported machinery and the means of production. By the late 1950's, Taiwan's production of labor intensive products had stagnated; they had to change their policies. Traditionally speaking, the late stage of the first phase is the time for the second phase of import replacement. Taiwan did this, but circumstances were not good. This was because the most beneficial thing for Taiwan at the time was not the production of means of production, heavy industry, and technologically intensive industries. Taiwan's greatest interest did not lie in these areas. Therefore, Taiwan engaged in a very short second phase of import replacement and then abandoned it. This was the reason for Taiwan's later success. This was also the case for South Korea, which went through the first phase of import replacement during the early 1960's and protected its own industry. During the mid-1960's, it found it very difficult to practice the second phase of import replacement, since South Korea's relative interest did not lie in heavy industry or in production of the means of production. As a result, South Korea also leaped into the third phase very quickly. During the mid-1960's, all of the "four small dragons" were in the third stage of development, namely the first phase of export guidance. During the mid-1960's, all of the small dragons developed. Why couldn't other places succeed? India, with a large area and a huge population, a very long history and quite a few natural resources did not develop. Why? It was because it engaged in the first phase of import replacement for a very long time, and then engaged in the second phase of import replacement afterward. India encountered very great difficulties. It did not have the skills and other requirements in being to do the job, but it still built its own heavy industry and technologically intensive industries; however,it did not succeed.Nevertheless,the Indians had very strong confidence and persevered right up until the present time, but they have still not succeeded. They are stuck in this period and cannot get out. India is a very good example that provides experience in failure. Nor will India open itself up. Up until the time of the "gang of four," China would not open up either. It protected its own markets and used maximum protectionism to protect its own economy believing that it was not succeeding because of such a large population. At the beginning of the 1970's, India saw how the "four small dragons" had succeeded and wanted to emulate the export guidance. But it was too late because all the markets had been taken over by the "four small dragons." So India is still at this stage. Very many countries are like India. They are unable to free themselves from the second stage of industrialization. They simply do not understand the importance of export guidance, supposing that since their own markets are very large they do not need to export.

We can arrive at some conclusions as a result of experiences in the world's economic development and the success of the "four small dragons." An industrialization policy is a policy of export guidance. Simply stated, export guidance means opening up to the outside world. Thus I believe that although there may be very many policies that China may discuss and revise during the next several years, in terms of overall direction, China is on the right path.World experience in economic development shows it is necessary to open up to the outside world.

Why are export guidance policies good policies? Because the practice of protectionism is bad for the distribution of natural resources and economic efficiency is very low. Distribution of resources is the highest goal in the study of economics. Economics means thinking of ways to distribute resources most efficiently. If you practice protectionism, that will make efficiency very low in the distribution of resources. During the initial export period, competitiveness will be very low. If you force goods into international markets, frequently some subsidization will have to be done. From the standpoint of economics, subsidies to help exports are a little better than protection to raise the price of one's own goods. If you want to break into the international market, you have to find some relative interest that is nearest to you. Every place has its own relative interest; even backward countries also have their own relative interests. If you engage in import replacement, there will be many chances to assess matters incorrectly, for doing things wrong without realizing it, and for continuing on in the wrong direction. But when you engage in export guidance, if your relative interests are wrong, you will be unable to break open external markets and you will have to revise them. Hence, when engaging in export, possibilities of making mistakes are few in the distribution of natural resources and in finding one's own relative interests.

There is another very important theory. In the realm of accumulations, western economists maintain that sole reliance on internal capital for a country's economic development is not enough. For a country to save up a lot of money is also of no use. Economic development requires use of two kinds of capital, namely both internal and external capital. The reason is very simple:not all countries have all kinds of resources. You, yourself, may have a vast amount of money, but there are still many things you cannot buy. You must have capital from outside in order to be able to buy things from outside. The money is divided into two kinds: internal money and external money for different uses. This is because an economy's development still has to depend on external resources. Quite often, because your country is a backward one, your own money cannot be used to buy things from abroad. China is an example. There are very many backward countries whose money cannot be used to buy resources from abroad.It is thus necessary to rely on one's own savings on the one hand and to find foreign resources as well. How does one obtain foreign resources? There are two ways. One is to import foreign capital; the other is to export. If you want to earn foreign exchange, the most active way is through exports. Importation of foreign capital is passive. If the funds do not come, there is nothing you can do. Why is export guidance a better policy for economic development? After you have imported capital, you can raise productivity and step up your own economic development. When foreign capital and foreign exchange increase and when more machinery and technology are introduced, productivity can be raised and the economy grows rapidly. So, the economic theory that economic development has to depend on two kinds of capital is definitely reasonable. Therefore, opening to the outside world is an important reason for economic development. Western economists discussed this problem long ago. But to know this principle is not enough. How does one put export guidance into practice? Not every country's economic development can opt for economic development at the very outset, because you still do not have an economic foundation. Neither Taiwan nor South Korea went in for export guidance at the outset, but went through a period of import replacement.The first phase of import replacement was the foundation. Without this foundation, how can your exports compete with those from foreign countries? Hong Kong and Singapore had no import replacement at all. They used export guidance from the very beginning. But, we should not forget that both Hong Kong and Singapore also had a foundation preparation period. Even before they industrialized, they engaged in entrepot trade, and the entrepot trade requires enormous capital construction, plus extensive trade experience and contacts. So they could opt for export guidance from the very outset.

2. Role of Various Production Factors During the Export Guidance Stage

How were the "four small dragons," particularly Hong Kong, able to do a good job of export guidance? If every country did a good job of export guidance and was successful, there would be no poor countries. But matters are not this simple. Export guidance is only a direction. Once one has a direction, one has to have other conditions as well that can be developed. We can look at the success of the "four small dragons" in terms of economics, politics and culture. In the economic realm, if you want to go in for economic development, and if you want to achieve strong competitiveness, both from the standpoint of western economics and from the standpoint of Marxist economic thinking, production factors are naturally very important. Western economists say that there are four production factors. The first is labor; the second is capital; the third is entreprenural spirit; and the fourth is land. Every kind of production needs these four things. If you want to engage in export guidance, during the first phase of export guidance of labor intensive industry, it is fine if wages are not necessarily low. The amount of wages has to be discussed together with productivity. If your wages are low and productivity is lower, that would be completely useless. So wages have to be at a reasonable level,and at a level that is very highly competitive. Achieving this means, first, that there can be no monopoly on the labor market. In foreign countries, trade unions are frequently too strong, as in the United Kingdom where trade unions have enormous power. They can strike at any minute. So monopoly is trade union monopoly. If trade unions have a monopoly on labor, wage levels cannot be reasonable, and competitiveness cannot be very great. In addition to this, worker productivity is also very important. Labor productivity is related to workers' cultural levels, how diligent they are, and how much education and training they have had. In Hong Kong, trade unions do not work for the workers' welfare; they wrangle about political issues. So no monopoly of the labor market has taken place. In Singapore, South Korea and Taiwan, the governments have immense power. They suppress trade unions and trade unions can do nothing about it. The "four small dragons" have no trade unions to monopolize the labor market, so wage levels are at a competitive level. Yet another element affecting workers' wages is how mobile labor is. If workers are not highly mobile, capitalists can control them because you cannot get away. Workers with strong mobility are better off.

As far as education is concerned, one feature of the "four small dragons" is that the educational level of the average worker is higher than in very many third world countries. I think this has something to do with Chinese culture. They have been influenced by Confucian thinking. Confucian thinking sets great store by education. Some people believe that this has had a bearing on the economic development and the fairly complete legal systems of the "four small dragons." But the facts are otherwise. The laws in developing countries often are intended to help the workers; however, unless the whole economy develops, very many workers will have no work to do and the workers themselves are the one's who suffer. Consequently,they hurt the workers. The "four small dragons" do not have this problem, but I'm afraid Taiwan has it a little. Capital is important, of course and when savings are insufficient, it is necessary to use foreign capital. The "four small dragons" use foreign capital, and they are able to use foreign capital very well. Using foreign capital very well means that domestic enterprises and foreign transnational companies work together to bring benefits from outside into domestic enterprises. If China were to import capital with foreign enterprises doing their thing and Chinese enterprises doing their thing, that would be of no use.

Entrepreneural spirit is important, and a spirit of adaptation among entrepreneurs is even more important. In Hong Kong, entrepreneurs from Shanghai take the lead. This is related to culture. It is Confucian culture; it is a traditional way of thinking. Under traditional thinking, Chinese workers want to become the boss all of a sudden. This is very natural. The west is different. They only want to have automobiles and houses and that's all. Hong Kong, Taiwan and South Korea are like this, but Singapore is not. Medium and small enterprises play a very good role, particularly during the first phase of export guidance.

If one asks a Singaporean what he would like to do in the future, his answer is to be on the staff of a transnational company. In Hong Kong, the answer is different. He wants to become the boss. The difference in thinking is because Singapore has not diffused the entreprenural spirit. Singapore was an entrepot for a long time engaging mostly in business and without an industrial entreprenural spirit. Prospects were not favorable. One should not emulate the Singapore example. If suddenly there is a crisis and foreign capital flees, it will be hopeless. Forty-five percent of Singapore's exports of industrial manufactures today come from transnational companies. If the transnational companies fail, it will have only 25 percent of exports left. Only 16 percent of Hong Kong's exports of industrial manufactures are from transnational companies. Hong Kong's economy belongs to Hong Kong, while Singapore's economy belongs to the transnational companies.

In South Korea, numerous entrepreneurs are not from South Korea. Korea's center is in the north, not in the south. It was only because of the split that they fled from the north to the south, and this is the source of South Korea's entrepreneurs. Taiwan had no industry. When the Japanese were in Taiwan they only went in for some agriculture. Once mainland entrepreneurs fled to Taiwan, Taiwan's entrepreneurs also fanned out.

Hong Kong's land policy has been severely criticized. Government intervention in land has been formidable, but it has had its good and its bad aspects. The good aspect has been development of many new market towns; the bad aspect has been government monopolization of land; it is a government preserve. Some people criticize the government for only selling the land and sending the money back to the United Kingdom, but this is unfair. The British are a little bit "clever;" the Hong Kong government puts its money in United Kingdom banks which pay interest that is lower than the world market rate. Aviation rights are also assigned to British aviation companies. Hong Kong has an inadequate supply of land, which is not good for development of the economy.

During the first phase of export guidance, an inadequate supply of land is not a large problem, but if one wants to develop heavy industry an inadequate supply of land is a big problem. Hong Kong's inadequate supply of land and lack of a long-term plan prevents development of Hong Kong's economy. Hong Kong land prices are very high. During the initial export period when export is a labor intensive enterprise carried on mostly by medium and small enterprises, insufficent land remains a not very large problem. Numerous small plants are mixed in with civilian houses. If heavy industry or knowledge-intensive industries are developed, insufficient land becomes a big problem.

In the final analysis, economic factors are dependent on market function, that is to say the role of the market is paramount and the role of government is ancillary. Do not suppose that the Hong Kong government does not intervene in the economy. That is inaccurate. Hong Kong 's intervention is least. In Taiwan, South Korea and Singapore, there is much intervention. Not only is there intervention, but their governments also control large amounts of industry and commerce, approximately 30 percent of them. To control these enterprises, the governments use very many methods. Do not suppose that all the enterprises in the "four small dragons" of Asia are private enterprises; many are owned by the state.

In addition to the four factors of labor, capital, entreprenural spirit and land, there is yet another factor, namely technology. The more freedom the better for labor, capital, entreprenural spirit and land; the market can play its role to the full. But with the element of technology, without government intervention technology would surely not develop. There is no experience and no foundation. Without government intervention and subsidies, production technology could not improve. This is because the development of technology is a very big problem. Individual interests and society's interest are very different. In the United States, for many industrial inventions and technical inventions the individual person remuneration rate is 25 percent but the social remuneration rate is 56 percent. This is a very serious problem. The Hong Kong government's non-intervention in technology is a mistake. During the initial phase of exports when products are labor intensive and technical requirements are not high, it doesn't matter much if government does not help individuals pursue technology. But this will not do for continued development. Both the South Korean and Singapore governments took action early to help development of technology. They realized that remuneration to individuals and to society were different. The biggest problem with the Hong Kong government is that it did not see the technology issue accurately. A free market cannot play the maximum role in every field; the market is not omnipotent. The market can solve a lot of problems and it distributes capital very well. Sometimes when social and individual remuneration differ, the government should certainly interfere. Hong Kong has been lucky. It has exported labor intensive products for the past 20 years for which technical factors have not been important, so no problems arose.

Hong Kong has successful experiences, but what problems exist? In going from the first phase of exports to the second phase of exports, in comparison with the other three "small dragons," there are many problems with its products. The crux is that a good job has not been done in technology. Development of technology cannot rely solely on private enterprise.

Economic and cultural development are closely related. During the past several years, anthropologists have been discussing the issue of the "four small dragons," and thinking back and forth that economic success contains non-economic elements. The "four small dragons" and Japan are connected to the Chinese cultural tradition, i.e., they are related to Confucius. No place in the world has had a 10 percent speed of growth except the places that eat with chopsticks. Consequently, "chopstick culture," and "chopstick economics" doctrines can maintain a 10 percent speed of economic growth. During the past 2 years, China has also had this speed of growth.

This "chopstick culture" is related to Confucius, namely in education, in the patriarchial system, social class concepts, and nationalist economies. These things are antithetical to modernization; however they are advantageous during the first export phase. They can stabilize society, which is a prerequisite for economic development.

According to Confucian culture, men of talent become officials. This is a very good thing because it can increase government efficiency and this is advantageous for development of the economy. This is very marked in Japan. Things are not this way in the United Kingdom and the United States. In the United States the best people become lawyers and make a lot of money.

Certainly Confucian culture also has disadvantageous elements such as the disdain of profit by men of noble character and the relegation of business to a very low status. These disadvantageous elements have become advantageous elements in the "four small dragons." Why? The governments of the "four small dragons" are very authoritarian and practice dictatorship. Talented people cannot engage in government and agriculture is not important in these places, so they go into industry and commerce.

This is a linking of cultural origins and the economy. This relationship, particularly Confucian thinking, can have a bad aspect during the second phase of exports. Family enterprises are disadvantageous for the running of large scale enterprises.

Possibly the reasons for success may be different in the first phase and the second phase of imports.

The political system is closely related to economic development. If you want to develop an economy, you have to have a strong government and an authoritarian government that has a high degree of economic development as its goal. This was the case during the first export phase for Japan and the "four small dragons." Both South Korea and Singapore had numerous financial groups that cooperated closely with the government and played a beneficial role in the economy.

A strong and highly efficient government plays a major role in the economy. The success of the "four small dragons" is attributable to having a combination of government, culture and economics. This was the model for development of the "four small dragons."

In sum, to export requires having highly efficient workers, flexible entrepreneurs, highly efficient administration and management and high accumulations. These are the prime conditions for engaging in exports.

The competitiveness of every country lies in competition in wages and technology, and technology has to be out in front. The "four small dragons" had no "edge" in technology; it was very difficult for them to develop and other countries pursued very rapidly. Malaysia, India and Thailand pursued them very hard. Because wages are very low in these countries, the "four small dragons" could be overtaken by other countries very early. During the early 1970's South Korea built shipbuilding, electrical machinery and chemical industries; however, luck was against them. These are all labor intensive industries and it was at this time that the petroleum crisis occurred. During the mid-1970's it was Taiwan, during the late 1970's it was Singapore, and today it is Hong Kong that is preparing to go into these industries.

Some people say that if the "four small dragons" take over the markets, what will China export? I don't think this will necessarily be a problem. Right now the "four small dragons" are entering the second phase of export guidance, and this will give China an opening. There is the "wild goose theory" that at various stages the economies of individual countries take off like row after row of geese. Japan took the lead; wages increased rapidly in the "four small dragons," and China's "luck" should be better than India's. During the early 1970's South America also started up in places like Brazil and Mexico, but they were too impatient. They ran when the "four small dragons" had not yet run. China should not be impatient in developing exports. It should do a good job on the first phase of export guidance and then go on to the second phase. In studying development of China's economy, one should look at the history of development of the whole world's economy. This is of definite reference value.

One of the problems in going from the first phase to the second phase in export guidance is markets and the second problem is technology. Why are markets important? In order for products to break into markets, one's own goods have to be tested in the markets and then take over the markets. This is what Japan did. The markets of the "four small dragons" are small, for them it is not a problem to open up world markets suddenly. After several years of effort, South Korea exported automobiles to Canada and the United States to enter world markets. According to the "wild goose theory," Japan will race ahead or there will be an opening for it to turn. South Korea did a good job of shipbuilding. Japan built big ones and high ones, and South Korea built small ones and low ones. Hong Kong's biggest problem is not giving serious attention to the development of technology. If the Hong Kong government would change its policies a little bit, in view of the large market with which it has close relations in China, its prospects would be better than for any of the "small dragons." The Hong Kong government holds the views that the reason things went so well in the past was that the government refrained entirely from interference and refrained entirely from having anything to do with developing technology. In fact, they do not understand that technological development has different stages,and requirements during the first and second phases of export guidance differ requiring different policies. The Hong Kong government has not understood this point right up to the present time. Hong Kong has been too greatly influenced by colonial policies.It is now entering a transitional stage and future policies will be a little more open and Hong Kong will have prospects. Otherwise the change from the first to the second phase of export guidance will be even more difficult.

3. Evaluation of the Special Economic Zones

A friend asked me whether my criticisms of the special economic zones was not excessive. In the past, criticism of the special economic zones was done from static discussion of the special economic zones, and they should be looked at dynamically. The economic development of the "four small dragons" just discussed had a preparatory period; they did not suddenly becoming exporting places. The preparatory period may be a period of entrepot trade. The economic zones have done not done a bad job of trade, but they have bought some things cheaply and sold them at a high price; tax collection has not risen; and much money has been earned. This is not good. This is a management problem. The special economic zones have a tax collection problem. The economic zones are entrepot places; they are a very good experience for international trade. So the special economic zones use tax reduction or exemption from taxes, taxes being collected when goods leave the special zones. What is wrong with this? Hong Kong and Singapore do the same thing, so when Shenzhen does it, what is wrong with that? International trade experience is not something that can be learned in an instant;but it can be learned through entrepot trade. What is bad now is that the special zones use reduction or exemption from taxes to sell things inside China. If some things are used in the special zones, tax collection may be reduced or waived; when they are taken into inland China, the same price is collected as for other things. This is all right. The criticism is that only 3 to 5 years have passed, so isn't it a little early to criticize; no problems are apparent after several years' time.

As for the "blood tranfusion theory," current figures show 7 percent as being given by the central government and most of the rest coming from bank loans. The central government has a responsibility for giving money to the special zones. Not only does this benefit the special zones, but it is in the interest of all Chinese. This is the economic theory of "extraterritorial benefit." If money is borrowed and repaid, what is wrong with that? Many of the people who criticize the special economic zones are not economists, and they do not understand economic theory.

Why should an enterprise make inventions? Making inventions benefits everybody. This is an "extraterritorial benefit," but it is not to say that the central government provides full support to the economic zones; use of some money to support the special economic zones is correct. Furthermore, borrowing of funds from banks to develop economic zone capital construction is also correct. Without money, how could they be developed? Foreign funds are fine, but if they are not forthcoming, you still have to do capital construction. The pay back period for capital construction is usually around 10 years. But only 3 to 5 years have passed, and you are saying it is no good. What is to be done? Borrowing money and repaying money to do business is the best. The question is whether one understands how to use the borrowed funds. Hainan Island borrowed money to buy automobiles; this was wrong. Shenzhen borrows money for capital construction to bring in foreign capital. It can pay it back in 5, 10 or 20 years, so what is wrong with that? We have to look at it this way. Take Brazil and South Korea as examples. Brazil borrowed an enormous amount of money and owed huge debts but it did not have the ability to repay the money. South Korea also borrowed and had huge debts. In world terms, South Korea has a very high debt ratio, but it has the ability to repay the money, so why shouldn't it borrow? When people in Hong Kong talk about the special economic zones, first they don't understand economics and second they just talk, focusing their attention on non-economic matters. Actually this is an issue that should be discussed only by economists, but those who criticize today are not economists. Economists are relatively sympathetic, and I am relatively sympathetic with the special economic zones. Nevertheless, this is not to say qhere are no problems. The problems are problems of special econoic zone policies. The money spent has not all been on export guidance; spending money on talented people is correct. Shenzhen has operated a lot of training classes and has trained too many people for management. This is not to say that management is not important; however, the important thing is the training of workers. Few workers have had sufficient training and they have had insufficient general education. Not enough money has been spent on this, and not enough attention has been devoted to medium and small enterprises.

If most of the investment in special economic zones has been on theaters, libraries and museums, that is wrong. These are showpieces. Money has been spent wrongly, but they believe that foreigners will go there only if there are such things. Not necessarily. This is a mistaken idea. I am not saying that everything in the special economic zones is all right, but I am saying that in criticizing the special economic zones, people have not criticized the things that should be criticized, and they have criticized things that should not be criticized.

NATIONAL POLICY AND ISSUES

DISCUSSION OF ECONOMIC REFORM, ECONOMIC LAW

Wuhan WUHAN DAXUE XUEBAO [JOURNAL OF THE WUHAN UNIVERSITY] in Chinese No 4, 1985 pp 27-32

[Article by Luo Mingda [5012 2494 6671]: "On the Reform of the Economic System and Economic Law"]

[Text] The Resolution of the CPC Central Committee on the Reform of the Economic System (hereafter, for short, "the Resolution"), adopted at the 3d Plenum of the 12th CPC Central Committee, points out: "The reform of our economic system and the development of our national economy require that more and more of our standards and principles of economic relations and economic activities be consolidated in legal form. The legislative organs of the state must speed up economic legislation, the law courts must speed up adjudication of economic cases, the procuratorates must speed up the investigation of economic crimes, and the judicial departments must energetically provide legal service for the benefit of the economic construction." This resolution of the Central Committee amply signifies the extremely close relationship between the reform of the economic system and economic law, and the extremely important place and role that economic law occupies in the reform of the economic system. It is therefore necessary to start a discussions on the topic of economic reform and economic law, combined with the present reform practice, a necessity for the promotion of smooth progress in the reform and for its healthy development as well as for the perfection of our economic law itself.

1. Liberation of the Social Productive Forces, the Essence of the Reform of Our Economic System

The reform of the entire economic system, with the main focus on the cities and with its core link being the strengthening of vitality in our enterprises, that we are presently carrying out is "a reform, conducted on the premise of firmly upholding the socialist system, of the whole series of mutually interrelated linkages and aspects in our production relations and in the superstructure, which we find inconsistent with the development of our productive forces." It is an intensification and development of all the various reforms in town and countryside since the 3d Plenum of the 11th CPC Central Committee. It is another broad and deeply penetrating revolution under the leadership of the CPC, carried out by the Chinese people of all nationalities. The essence of this revolution is the liberation of China's productive forces from the fetters of the present economic system and allowing them to develop and progress with greater speed, greater effectiveness and an abundance of vitality.

The term "economic system" is the collective name for all the various specific systems of the social economic structure and the state's economic controls; it is the concrete reflection and manifestation of certain production relations. According to the fundamental principles of Marxism stating that the production relations must be consonant with the nature of the productive forces and that the superstructure must be consonant with the economic foundation, the economic system of a country must be conditioned by the developmental level of its social productive forces and any other of its national conditions. The economic system that fits the country's developmental level of social productive forces and is consonant with the country's national conditions will have the effect of promoting the development of the productive forces; in the opposite case, it will obstruct and hinder the development of the productive forces.

China's present economic system, established in the early years after the founding of the PRC in emulation of the Soviet economic system of those days, and later gradually developed under the influence of an erroneous "Leftist" guiding ideology, is a highly centralized, unitarian economic system. Under this type of economic system, enterprises actually become appendages of the state's administrative organs. All economic activity has to follow the baton of the administrative organ, while the enterprises lack all the self-determination that should be theirs in matters of production and business operations. The inevitable result was a fusion of governmental administrative and enterprise business functions, a divisiveness between central and local authorities, the phenomenon of "all helping themselves from the public pot," a situation which seriously hampered production and business enthusiasm in the enterprises and among the broad masses of staff and workers, strangled all vitality in the socialist economy and fettered the development of the social productive forces.

As to the sources of its ideology, the present economic system with its excessive centralization is closely linked with the immutably fixed concept of an absolute nature of the socialist planned economy, a concept that does not recognize or does not fundamentally recognize the historical necessity of developing commodity economy during the socialist stage. In other words, this "Leftist" immutably fixed concept is the theoretical foundation of our present highly centralized economic system. It is precisely because of this "Leftist" immutably fixed concept that people regard planned economy and commodity economy as antagonistic opposites. The commodity production and commodity exchanges that objectively exist during the socialist stage are erroneously regarded as something that "has to be restrained under the proletarian dictatorship," and that must not be allowed to develop, otherwise it would lead to "revisionism" or "capitalism." It must be pointed out that this "Leftist" immutably fixed concept, which is divorced from reality, and the economic system that formed and developed under the guidance of this concept is not consonant with the realities of the socialist stage, is divorced from the present developmental level of China's productive forces and is not in harmony with China's national condition.

The practice of socialist construction has proven that since production has not yet developed to a high degree and social products are not yet available in abundance, the ownership system in the socialist stage not only maintains the two forms of public ownership, namely ownership by the whole people and ownership by the collectives of the masses, but also preserves individual economy and other economic patterns as complements to the public ownership economy of socialism. Between all economic entities, social organizations and the broad masses of workers, there still exist, in addition to the community of basic interests, the special individual interests of each group, and the exchanges of labor between them can only take place on the principle of mutual exchanges of equal labor. The existence and development of commodity economy throughout the entire historical stage of socialism is therefore inevitable. Maintaining an accurate view of the objective reality and proceeding on the only way that history prescribes will lead to the development of production and prosperity of all undertakings. In the opposite case, one will have to suffer the penalties of the objective law. This is the way of historical dialectics.

A great contribution in theory and practice made by the 3d Plenum of the 12th CPC Central Committee was its scientific summing up of the historical experiences of socialist construction and its recognition, based on an integration of the cardinal principles of Marxism with the Chinese reality, that socialist economy "is a commodity economy on the foundation of a public ownmership system," thus providing a firm theoretical foundation for the reform of the entire economic system with its main focus on the cities. The task that we are now faced with is to have to take this theory as our guideline in resolutely breaking down the fetters of the leftist erroneous guiding ideology and of other outworn concepts. We must thoroughly reform the present economic system that has for a long time restrained the development of China's social productive forces and must start out from the realities of China's condition in going our own road to build up a socialist economic system with Chinese characteristics, filled with an abundance of vitality, to promote the development of our social productive forces.

2. Economic Law, an Important Legal Weapon That Guarantees the Smooth Realization of the Reform of Our Economic System

The reform of the economic system is a deeply penetrating social revolution for the liberation of productive forces. Our complete victory in this revolution is decisive for the fundamental turn for the better in the country's finances and economy, for the realization of the struggle objective set by the 12th CPC Central Committee, namely of quadrupling the gross industrial and agricultural output value by the end of this century, as it is equally important for building China into a modern, strong socialist state with a high degree of material and spiritual civilization. The reform is therefore presently the principal concern of the entire party and all the people of the nation, as it is the country's overall great affair. All other work must directly or indirectly serve this objective and submit to its test as to whether any such other work is to be pursued or not. Economic law, which regulates the economic relations, is an important sector of our socialist legal system; it is an important tool used by the state to guide, organize and control the national economy. Because it is so much closer to the basic economic relations, it is so much more sensitive in its reactions to developments and changes in the economic foundation, and more substantial and forceful in its impact on the foundation. Its special function and mission is therefore to safeguard the smooth progress and healthy development of the reform and to provide the legal weapon for the realization of the reform objectives.

(1) Economic law is legal assurance for the mobilization and organization of the people to devote themselves to the practices of the reform.

The reform of China's economic structure conforms to the demands of the historical development of society, is consonant with the objective economic law and manifests the interests and aspirations of the people. This is why the reform is warmly endorsed and supported by the masses. However, due to the long-term influence of an erroneous "Leftist" guiding ideology and the many policy changes, to which must also be added the occasional wilful encroachment on the citizens' activities of gaining prosperity through work, the people generally hope for the state to consolidate in law its policy of reform, of opening up and of invigorating the economy, so that their lawful interests will receive the recognition and protection of the law. This state of mind among the people, namely of having more faith in law than in policies, reflects a lingering fear of the "Leftist" errors of the past. However, it also explains that economic law, providing affirmative, clear, definite and generally applicable norms, is indeed highly effective in reassuring, mobilizing and organizing the masses to devote themselves to the practices of the reform.

(2) Economic law is to straighten out whatever improper economic relations come to light during the reform as requiring adjustments, and economic law is also an important legal weapon to remove all interferences and obstructions.

During the reform of the economic system, following the separation of government administration and enterprise management and the broadening of self-determination for the enterprises, the lateral economic relations continuously increased and economic intercourse rapidly blossomed forth. This is evidence for the fact that the nation's economy recovered its vitality, and is the inevitable result of the reform. However, since the reform is a deeply penetrating revolution, it is unavoidable that encroachments and obstructions of various kinds should also occur. Conspicuous instances of such are the cases in the ealier stages when economic organizations or citizens took advantage of the reform to commit violations of the state's plan and laws, to conduct improper competition, to arbitrarily raise prices, to indiscriminately issue bonuses or materials, and when some party or government organs used the powers of office to run enterprises for personal gain, etc. It is for this reason that economic law, through its regulation of economic relations, moves the reform on to the track of the socialist legal system and provides a powerful protection for all those economic relations and economic activities that conform to the demands of the reform and are capable of promoting the development of the productive forces. It will resolutely suppress and mete out punishment if economic relations and economic activities run counter to the purpose of the reform, interfere with the progress of the reform and obstruct the development of the productive forces. In this manner economic law becomes the important legal weapon for the regulation of the various economic relations that surface in the course of the reform, for promoting the smooth progress of the reform and to ensure the realization of the reform objectives.

(3) Economic law is an important tool for the strengthening and perfecting of party and government guidance in the reform of the economic system.

The reform of the economic system is a social transformation of broad and deeply penetrating dimensions and of an extremely complex nature, as it is also a grand exploratory and innovative undertaking of mass character, as has never before been carried out. For our complete victory in this reform, it is necessary to strengthen and perfect party and government leadership throughout the entire reform, "change the method of solely relying on administrative measures to control the economy, integrate economic and administrative measures, pay attention to the use of economic levers and to control the economy by means of economic laws." (Footnote 1) Economic laws are party and state economic policies rendered concrete and textually visible in identifiable form as norms. The current economic laws are the overall party and state guidelines for the reform, for the opening up of the country and for the invigoration of the economy, formulated from different viewpoints and dealing with different aspects, possessed of the common characteristics of stability, authoritativeness and general applicability. Using economic law in leading the reform will assist the party and the government in giving meticulous guidance and powerful direction to the reform, will ensure that the entire reform progresses in a planned manner, step by step and in good order, and that victory will be gained with zealous, yet also reliable and safe action.

As a great revolutionary practice, the economic reform possesses an extremely high degree of authoritativeness. If economic law is to fulfill all its functions in the service of the reform of the economic system, it must accurately reflect the objective economic law and give expression to the objective demands of the reform. It has therefore become an urgent task in China's present efforts to build up its legal system, to direct strong efforts toward the building up of its economic laws, based on the demands of the reform of the economic system.

3. Speeding up economic legislation, a pressing demand of the reform.

Just as there have been great achievements in the building up of China's entire socialist legal system since the 3d Plenum of the CPC Central Committee, great achievements have also been made in China's economic legislation. During this period of time, the state formulated and promulgated over 30 economic laws and other documents of important normative nature, regulating economic relations. The documents of normative nature, such as regulations, rules and resolutions, issued by the State Council and its subordinate ministries and commissions number more than 300. These agencies, furthermore, compiled a Plan for 1982 to 1986 Economic Legislation. According to a resolution by the State Council, all state organs at whatever level are in the last few years sorting out, comprehensively, all laws and regulations issued since the establishment of the PRC. Following the 3d Plenum of the 12th CPC Central Committee, the state's legislative organs, according to the "Resolution" of the Central Committee, accelerated the work of economic legislation and again drafted, formulated and promulgated a number of important economic laws. The Third Session of the Sixth NPC deliberated and passed a Resolution on Granting Authority to the State Council To Issue Provisional Regulations or Rules Regarding the Reform of the Economic System and the Opening Up Toward the Outside World. All the above-mentioned laws, regulations and measures have played a very important role in promoting and safeguarding the reform of the entire economic system with its special focus on the cities.

However, we must also realize that due to such factors as the influence of the erroneous "Leftist" ideology, the poor foundation on which China's legal system is being built and the low level from which this buildup starts out, also due to the fact that many current individual economic laws lack normative nature or are of low normative nature, and, furthermore, due to the rapid developments in the state of the reform, economic legislative work can still not yet satisfy all the needs of the reform. In the present social and economic life, the problem of "no law to follow" has not yet been radically solved. It still occasionally happens that the masses speak of conditions that are "rational but not legal" or that are "legal but not rational." Acceleration of economic legislation, therefore, still remains the core link in the building of the legal system, otherwise it will not be possible for economic law to be highly effective in its service to the reform.

How to accelerate economic legislation? I believe the following has to be done, energetically and emphatically:

(1) We must one step further clarify the guiding ideology of economic legislation.

The guiding ideology of legislation is what in jurisprudence is called the legislative motivation or legislative intention. It demands a reply from the legislator to the questions why to legislate and what to legislate, what social effect is to be achieved by the legislation, etc. These questions seem like an ideological line that permeates all the articles of every law; they determine the character of each law, its task, purpose and direction and are the most important and most fundamental questions in all legislative work.

Following the 3d Plenum of the 11th CPC Central Committee and through their efforts to bring order out of chaos, the party and the state restored the Marxist ideological line, political line and organizatinal line, while the focus of work was shifted to economic construction, and the work of socialist modernization was acknowledged by the constitution as the fundamental task of the whole nation. In the last few years, the guiding ideology in our economic legislation was, therefore, generally speaking, a correct one, displaying the spirit of the constitution and consonant with the demands of the reform while also beneficial for the promotion of the development of the productive forces. However, investigating the situation according to practical standards, there are still certain questions that require further clarification, or that must be straightened out one step further. First, some of the current economic laws and regulations still show a tendency to regard planned economy as something absolute and give insufficient attention to the promotion of the development of the socialist commodity economy. They thereby lose, altogether or partly, their effectiveness in the reform as to the regulation of economic relations and thereby also adversely influence their own relative stability. Second, some departments or localities draft state or local economic laws and regulations without giving full consideration to the situation as a whole, some even go so far as to seek to extend their departmental or territorial powers by means of drafting certain laws and regulations. These problems on the one hand reflect the fact that we have not yet thoroughly discarded the fetters of the erroneous "Leftist" guiding ideology or of other outworn concepts, and that our thinking has not yet been fully liberated. On the other hand it also reflects the fact that certain departments or localities are influenced by unhealthy tendencies and still tend to use the powers of office for personal gains.

The "Resolution" of the Central Committee points out: "The fundamental task of socialism is to develop the social productive forces, that is, to enable more and more social wealth to be brought forth, and to continuously satisfy the daily growing material and cultural needs of the people." Economic law is precisely promoting the development of the social productive forces by means of regulating the economic relations. Those working in economic legislative work must therefore firmly espouse the ideology of bringing about legislation that will promote the development of the social productive forces and that will promote the socialist modernization projects. They must use the ideology as the most important criterion to test their own legislative guiding ideology as to whether it is clear, definite and correct. If it should not be thus, our economic legislative work will lose direction, central substance and soul.

(2) Planning all economic legislation must start out from the idea of an accurate coordination of the relationship between an enlivened microeconomy and macroeconomic control.

The core link of the reform of our economic system with special focus on the cities is the effort to strengthen the vitality of our enterprises and invigoration of the microeconomy. However, it is not possible to separate invigoration of the microeconomy from macroeconomic control. Without an enlivened microeconomy, it is of course out of the question to speak of macroeconomic control. In the opposite case, without macroeconomic control, microeconomic invigoration would lose its direction and objective and in the end fail in its purpose. Economic legislation must therefore accurately reflect this inherent relationship of dialectic unity. Whether in our concepts and plans for our entire legislative work, or in the drafting and formulating of a particular piece of legislation, we must always pay attention to coordinate the two accurately to avoid control being lost due to the one-sidedness of legislation macroeconomic or microeconomic endeavors ending in failure.

We must affirm that under the conditions of socialism in China, due to the community of interests between state, collectives and individuals and the comunity of interests between the situation as a whole and its parts, also between the immediate and the remotely future interests, economic legislation not only must, but actually can accurately coordinate microeconomic invigoration and macroeconomic control, ensuring that the national economy will harmoniously develop in a vigorous way without becoming chaotic. As far as legislative work is concerned, the focus of present attention is still on invigorating the microeconomy and energetically developing socialist commodity economy. Invigorating must be carried out solidly and not only in empty words. In the preceding period, some economic organizations, to enable themselves to issue bonuses and materials indiscriminately, indulged in boasting and exaggerating and created only a false image invigorating the economy, while no enterprise was in reality being truly invigorated. According to the provisions in the Central Committee's "Resolution," the criterion for the determination whether an enterprise is truly invigorated should be whether its production has been developed and whether its performance has been improved. The concept and plan in economic legislation must focus on urging the leadership and the masses of staff and workers to apply great skill on economizing in live labor and materialized labor and show themselves truly capable in this respect. We must urge people to achieve high results by starting out from improving enterprise business management, from exploiting potential, renovating, transforming and from the development of intelligence, and not to start out from doing harm to the interests of the state and the consumers and in that way get "results." In summary, coordinating the relationship between invigorating the microeconomy and macroeconomic control is at present an important problem that must be solved in economic legislative work.

(3) We must accelerate local economic legislation on the premise of not conflicting with provisions of the constitution, laws and administrative regulations.

Comrade Deng Xiaoping pointed out as early as in 1978: "We have presently a large volume of legislative work and we are short of manpower. Our laws may therefore first be rather roughly worded, they may later be gradually perfected. Some regulations may be first tried our by localities, to be later, after summing up experiences and improving the regulations, formulated into laws that are to be enforced throughout the country." (2)

In the present reform of the entire economic system with primary focus on the cities, the first important step has been taken. In the course of the reform, many new questions will require prompt decisions which will have to have legal force. Among such questions, those for which legislative conditions have matured, the state's legislative organ may promptly draw up laws. Those that belong in the sphere of administrative norms should be handled by the State Council, which should draw up administrative laws and regulations. In addition, many new complex questions, beyond the sphere that should be regulated by administrative laws and regulations, we still lack practical experiences to solve. These require further exploration and trials, and the state's legislative organs should draw up new or supplemental provisions. In those cases where conditions are not yet ripe for amendments, action should be take according to the "Resolution on Delegating Authority," deliberated and passed at the Third Session of the Sixth NPC. The State Council should then draw up flexible and adaptable provisional regulations or provisional statutes.

Due to the vast territory and huge population of China, extreme differences exist in the economic conditions and level of development of different localities. In order to start out from the actual conditions, the reform must be carried out in conformity with local conditions. Local legislative organs must observe the provisions of the constitution in speedily determining their economic laws and regulations of local nature. Presently, we do not have too many economic laws and regulations of a local nature; they are in fact most inadequate, and not at all in harmony with the developments of economic legislation for the entire country. We must realize that without proper coordination between local economic legislation and such legislation for the entire country, it will be impossible to practically implement the economic laws promulgated by the state, which will have an adverse effect on the efforts of the state to establish a perfect legal system for the whole country.

To strengthen local economic legislation, we must first demand that the local leadership at all levels strengthen their concept of the legal system, raise their own consciousness of law and overcome the attitude of merely following "the will of the boss." Second, we must provide local legislative personnel and raise the quality of their knowledge of economic law and the level of professional ability. Finally, the local economic legislation must form a complete system with the national economic legislation; it must be in line with and of service to the national legislation.. At the same time, economic laws and regulations of a local nature must not conflict with the provisions of the constitution, of pertinent laws, of administrative laws and regulations or with the provisional rules and regulations determined according to the "Resolution on Delegating Authority." Local legislation must also be limited to sectional reform questions within the jurisdiction of the locality in question. If the matter concerns the execution of important reforms of nationwide character, it is the State Council that must effect a uniform disposition. Reforms that have a bearing on the overall situation or affect a broad sphere can only be put into effect after approval by the State Council.

(4) We must integrate this work with the overall cleanup of all laws and regulations issued since the establishment of the PRC and conscientiously do a good job of compiling a compendium of current economic laws and regulations to have them gradually form a complete system.

According to the resolution of the State Council, the central and local state organs are now carrying out a cleanup of all laws and regulations issued since the establishment of the PRC. On the foundation of this work, the state's legislative organs must do a good job of compiling and straightening out the currently valid economic laws and regulations. Those that do not more meet the demands of the reform and of the modernization drive must be revoked in proper legislative procedure. Those that are mutually contradictory must also be readjusted in proper legislative procedure. Where blanks exist, a record should be made in the plan for economic legislation, and action should be taken to fill the gaps, step by step, according to the principle of giving preference to the more important and urgent legislation. Through compilations and adjustments, China's economic laws and regulations shall gradually be shaped into a uniform entity, internally well linked together, to have them observed and implemented by the judicial organs and the entire people.

(5) Close attention must be paid to the scientific nature and feasibility of economic laws and regulations.

Economic legislation is scientific work of greatest gravity. Under no circumstances must it be undertaken carelessly or perfunctorily. Each law or regulation that is to be enacted must have been investigated and studied by an experimental unit. We must possess a large and reliable corpus of legislative data and in addition institute comprehensive scientific deliberations, to get to the state that every new law or regulation will be consonant with reality and science and will be feasible. Only if we recognize that an article is up to standards should we enact that article, but never feel forced to enact an article that we feel is not up to standards; otherwise, no matter how many laws we enact and how fast we enact them, they will be useless, or even have the opposite effect to what we intended.

4. Energetic Development of Education in Economic Law and Training of Personnel Proficient in Economic Law

Comrade Deng Xiaoping said in the "Resolution" that "the most important part is Article 9." "Article 9 says, to put it briefly in four words, 'respect knowledge, respect talent'." (3) This important directive by Comrade Deng Xiaoping is also absolutely applicable to the buildup of the economic legal system. There is a saying: "Having merely law without the means to apply it." Even with the best of economic legislative work, if there is not a large contingent of cadres well versed in economic law to implement it, the laws will not by themselves regulate social economic relations and promote the development of productive forces. Worse still, if the problem of economic law personnel is not solved, it will also not be possible to be truly successful in the work of economic legislation. We must realize that after the thorough implementation of the policy of "opening up toward the outside and invigorating the domestic economy" and after the development of our modernization drive, there will be a rapidly increasing demand for economic law personnel. The requirement of enterprises for long-term legal advisors alone will be for not less than 10,000 persons. Economic law as an independent department of law and of jurisprudence has emerged only after the 3d Plenum of the 11th CPC Central Committee. It is only in the last few years that all higher law schools and colleges and colleges of finance and economics throughout the country are starting courses in economic law. To say that there is an extreme shortage of legal personnel is talking about a great weakness in the state's personnel requirements. In this extreme shortage, there is an even more extreme shortage of economic law personnel, a great weakness within a weakness. The energetic development of economic law education and training of economic law specialists has therefore become an outstanding problem in the building of our economic legal system.

In the development of education in economic law, the key is to find persons qualified to teach. Those now engaged in teaching economic law throughout the country number around 200, mostly middle-aged teachers of around 50. We admit that this contingent is quite good. In recent years, these people, working and living under difficult conditions, have shouldered a heavy work load inside and outside their institutions. They did arduous exploratory work in economic law theory, also participated actively in the state's economic law legislation and made many valuable contributions toward the building up of the economic law system in China. However, in the same way as it is true of the entire contingent of our qualified teachers of law, the problem that exists among the teachers of economic law is that there are too few, their qualifications are weak, and that by age and knowledge they are somewhat outdated. To solve this problem, we must on the one hand vigorously push education and improvement of quality of the present teachers, directing our efforts to a variety of different targets and employing a variety of different patterns, and on the other hand those institutions that have favorable conditions must expand accepting post-graduate students or institute post-graduate courses in economic law, and in this way exert great efforts in training a new force of students to supplement the present contingent of teachers. In this way alone will we be able to provide a solid foundation for China's undertaking of education in economic law.

To develop China's undertaking of economic law education, we furthermore require teaching material that is fairly complete in the treatment of the subject, that has a fresh approach with new breakthroughs and is relatively solid. In the last few years, China has produced several editions of economic law textbooks which have indeed been very effective in meeting the pressing needs of instruction and in fulfilling the instructional task. However, economic law is a new department within jurisprudence that is only now being opened up and is still in the stage of initial development. Furthermore, much material is continuously being added by the reform and by new economic laws and regulations, while some of its older substance has become outdated. For all these reasons, we must now use new material and new research results in supplementing and revising our teaching material. We must bring out textbooks of highest perfection, showing new breakthroughs, new creations and a relative stability. At the same time, the scope of economic law is very broad; it touches on the legal regulation of all the various sectors of the national economy. We must therefore compile sectional economic law textbooks in a planned manner, step by step, gradually combining them into a fairly complete branch of a scientific system. This will be beneficial for the promotion of developments in all branches of the national economy. In compiling teaching material we must conscientiously implement the "hundred schools" policy, allow teaching material to express the ideas of different schools and publish material of different standards, different levels and in different editions. We must not indulge in a uniformity of patterns, editions and tones, so as to benefit the development of economic jurisprudence.

To meet the urgent need for economic law personnel in our modernization drive, we must exert efforts to produce many talents of high quality. In our standards and instructional patterns for the training of talents, we must take our base on the principle of combining popularization with raising quality, and in our instructional pattern adopt a variety of standards and proceed on many levels and in many forms. Well-qualified law institutions and finance and economics colleges may institute special economic law disciplines or special economic law sections, enroll post-graduate students of economic law or institute post-graduate courses in economic law and train specialist in economic law who will be conversant with law, know foreign languages and have a mastery of modern technology. Generally, institutions that set up economic law courses within the law discipline should make these courses compulsory. At the same time, through training courses or through a pattern of classes run jointly by colleges and actual departments and enterprises, we must carry out the training of economic and judicial personnel presently serving, also of lawyers, notaries public and legal advisors of enterprises, members of legislative bodies, and personnel in administrative charge of economic contracts. In addition, training of economic law personnel could be done through instructions by periodicals, by correspondence or through television universities popularizing economic law knowledge. Regardless of what form of instruction is used, we must in all of them strive for quality and focus attention on raising the quality of knowledge of economic law among our students, and this not only for the purpose of gaining a diploma or a record of formal instruction.

ECONOMIC DEVELOPMENT ZONES

TIANJIN REFORMS, OPENING, ECONOMIC GAINS NOTED

Beijing LIAOWANG HAIWAIBAN [OUTLOOK WEEKLY] in Chinese No 9, 3 Mar 86 pp 16-17

[Article: "The Reform and Opening of Tianjin"]

[Text] Tianjin is one of three municipalities under the direct jurisdiction of the Central Committee. As China promotes reform and opens up, what are the present circumstances and trends in Tianjin's economy?

Comprehensive Reforms Have Brought Visible Results

Comprehensive reform of its economic structure has been stressed in Tianjin for more than a year and the effects are already visible:

--Enterprises have been invigorated and there have been notable gains in economic results. In 1985, Tianjin's GVIO reached more than 28 billion yuan, an increase of more than 12.5 percent over the previous year. As to net output value, it is estimated that new product operations accounted for more than 10 percent of output value. The quality of goods has risen steadily and the rate of top-grade products has reached 30 percent; numerous products have received gold and silver quality awards, which puts Tianjin in the front ranks of the nation. The growth in total income from product sales and real profits was higher than the growth rate in output value. Both individual labor productivity for industrial enterprises and local government income increased more than 10 percent over the previous year. After-tax profits for enterprises has been gradually increasing annually, and with the addition of credit assistance financed by the state and by banks, the technological transformation of enterprises has made great strides. In 1984, all together 60 important technological transformation projects were completed in the municipality; the overall investment of 1.16 billion yuan was able to produce an increase in output value of 2.55 billion yuan and increase tax receipts by 740 billion yuan.

--Price reforms are moving ahead smoothly, buying and selling has been brisk and markets have been stable. Beginning in May, 1985, Tianjin Municipality has proceeded with coordinated, integrated price reforms for meat, eggs, fowl, vegetables, aquatic, and other related products. The basic idea behind these reforms is the rationalization of prices, adjustment of supply and demand, stimulation of the flow of goods and markets that are flourishing. In order to prevent a fall in the living standard following an increase in commodity prices, the municipal government will extend a subsidy to each worker and his family on the price of nonstaple food items and has also adopted a series of measures that will allow state-run commerce to play a leading role in the market and in the leveling of prices. The latest price hike in nonstaple foods was significant, but it did not result in any serious jolt to society because both markets remained basically steady and people stayed calm. Producers are becoming more and more active as sideline agricultural production showed a significant increase. The number of hogs, laying hens, and beef cattle on hand and the volume of aquatic production has either doubled or tripled in growth over the last year. The numerous channels for and methods of business purchases and sales and the unfolding competition between the state, collective, and individual enterprises, and the various other organizations that integrate buying and selling, is mutually complementary, for it is triggering an increase in product variety on markets, a rise in quality, a tendency toward a more balanced supply between high and low seasons and an improvement in service.

--The reform of the wage system is the first step into a new era. The wage system for middle and grade school teachers as well as state agency units will be based on the reform program established by the State Council, which means a switch to a structured wage course. The rather low incomes of both intellectuals and workers for these units will be increased noticeably and steps will be taken to establish as a foundation the principle of tying individual income to work achievements, professional duties, and the division of labor. Enterprise units are universally proceeding with the reform that calls for them to pay their own wages and to draw a portion from their bonus fund and tie it to workers achievements. Because increases in workers wages are tied to the after-tax profits of an enterprise, many poorly administered enterprises have consequently made a great effort to raise economic gains. Since the first stage of the wage structure reforms has been implemented, the cost of living and income of Tianjin residents in 1985 increased more than 20 percent over the previous year and savings deposits for both urban and town dwellers increased by more than 30 percent.

--Macroeconomic controls have been clearly effective. To counter phenomena such as the loss of control over various aspects of the macroeconomy that began to appear in the fourth quarter of 1984, Tianjin has adopted several strong measures to guarantee that the economy develops in a coordinated, stable way. Tianjin's fixed-capital investment scale, bank credit issuance, money supply, consumption funds and local usage of foreign exchange are all under effective control.

--Urban and rural construction are rapidly expanding: the change in the appearance of the city is striking. In the last few years, Tianjin has annually constructrd more than 3 million square meters of new housing for urban and town dwellers, which exceeds total amount of new housing constructed during the period 1949 to 1980. In 1985, 250,000 square meters of low-lying, damp housing were transformed and 60 avenues were overhauled. Upon completion 2 years ago of a massive engineering project in water conservancy that brought water from the Luanhe to Tianjin, the history of bitter and salty drinking water for Tianjin residents came to a conclusion in one fell swoop. In 1984 construction of the nation's largest sewage treatment plant was completed; it can process daily 260,000 tons of sewage. In 1985, an excellent highway that encircles the central district and semicircles the western half was completed; ground has also been broken and labor begun on the semicircling of the eastern half. The crowded traffic and transport conditions have been alleviated. During 100 days in 1984 a food commodity avenue consisting of 100 businesses carrying an assortment of flavorful items was completed and in 1985, ancient culture and international market streets were founded. Also in 1985 a 3-year universalization of availability of gas project got underway. Recently goals were set to universalize the availability of hot water within 5 years and to universalize the availability of heating within 7 years. In outlying counties, villages, and towns, highway and general construction are progressing in leaps and bounds. The first part of the engineering work to restore the ancient great wall at Jixian has been completed and it has already been opened up to foreigners.

In April, 1985, Tianjin established an overall plan for the city; it was decided that Tianjin would be turned into a city with an integrated industrial base possessing advanced technology and a multifaceted economic center with a modern, open international port. The guiding concept behind the general plan for Tianjin's overall arrangement is: "to kill two birds with one stone." The river and the ocean will be the pivot points for the entire city and the old section of the city will be transformed into the city center. Industrial development will be stressed in the eastern section and a major effort will be made to develop the coastal area. Regarding areas surrounding the city, Jixian should be actively developed into a scenic tourist area and satellite towns and cities in the outlying counties should be formed into a network somewhat like planets orbiting their sun. This is a magnificent blueprint to be achieved within a 10-year time frame and should serve to inspire the people of Tianjin to work hard and struggle for an excellent future.

The Open Door Is Progressing Nicely

Tianjin has now taken a first step in opening its doors to the outside, and both the utilization of foreign capital and the attraction of technology have progressed rapidly. Since 1979, Tianjin has signed more than 120 commercial agreements and joint capital ventures with 10 countries, including Japan, the United States, the FRG and Hong Kong. Fifty-one joint capital enterprises are already in operation and more than 80 percent of these signed contracts or began operations in 1985. Total sales for Tianjin's joint capital enterprises have already exceeded 100 million yuan and the profit rate is 24.5 percent; the majority have either balanced their foreign exchange accounts or hold a surplus.

In 1984 the State Council approved Tianjin as 1 of 14 coastal cities open to the outside and to be given priority assistance. A proposal to establish an economic and technological development zone has also been approved. Construction of an initial 3 square km area of the development zone is progressing rapidly and a section is already prepared for construction of plants employing foreign capital. Twenty-one agreements have been signed with foreign businesses and in 1986 20 enterprises will be established and begin operating.

Tianjin is moving quickly to take advantage of broader foreign exchange privileges to attract advanced foreign technology for the transformation of older industries; project standards and the effectiveness of operations have shown a marked improvement in comparison to a few years ago. Since Tianjin harbor instituted the new system of "dual leadership with localities as the leaders" in June, 1984, economic indicators have all attained record levels.

1986: Consolidation, Assimilation, and Enhancement

There are still several problems relating to Tianjin's reforms and economic development that require solutions. For example, economic gains are still short of ideal, methods of market management and supervision are still rather imperfect, production sources for exports are still deficient and the value of exports departing from Tianjin's port still has not reached optimal levels, etc. These problems necessitate continued research for solutions.

Looking a couple of years ahead at the reforms and opening of Tianjin, in general the thinking is: Things should neither speed along too quickly, nor grind to a halt, and by all means there cannot be a retreat. Furthermore, the achievements of the last few years and especially those resulting from the reforms of 1985 must be consolidated and assimilated, and there must be a realistic assessment of the guiding philosophy behind the reforms; that is, expanded privileges, simplified government control, stimulation of the microeconomy and the need to preserve the beneficial and eliminate the harmful. In order to enhance macroeconomic controls and to further liberalization and invigoration, Tianjin must correspondingly set up and perfect its markets, which includes striving to expand consumer product markets, developing production resources and money markets; at the same time it must bolster economic laws and supervision and gradually reform the economic management structure.

FUJIAN 1985 ECONOMIC STATISTICS COMMUNIQUE

OW280201 Fuzhou FUJIAN RIBAO in Chinese 9 May 86 p 2

[Communique by the Fujian Provincial Statistical Bureau on the statistics of the province's 1985 economic and social development]

[Text] Under the leadership of the Fujian Provincial CPC Committee and the provincial government, people in the province further implemented the policies of invigorating the domestic economy and opening to the outside world, continued to carry out special policies and flexible measures, and deepened reform of the economic structure in 1985, thus bringing about a sustained, stable, and coordinated development of the economy. Total product of society (Note 1: Total product of society is the total sum of agricultural, industrial, building industrial, transport, postal, telecommunications, and commercial [indcluding the material supply, marketing and catering trades] output value. National income is the total sum of the net value of the above) for 1985 was 34.35 billion yuan, a 19.2 percent increase over 1984. Of this, total industrial and agricultural output value was 27.218 billion yuan (Note 2: Total industrial and agricultural output value was 23.622 million yuan, calculated at the constant prices of 1980), an increase of 19.8 percent over the previous year; and national income was 16.027 billion yuan, representing a 14.4 percent rise. On the basis of developed production, both buying and selling on the market were brisk, revenue and expenditure were balanced, and the incomes of people in urban and rural areas continually increased. The main problems existing in the province's economy are: The economic foundation is relatively weak, there is a strain on the supply of energy and raw and semi-finished materials and on transport and communications, and economic results are not ideal.

1. Agriculture

In 1985, the second stage of reform was carried out in depth in the rural areas, agricultural products were purchased by contract, and the structure of rural production was readjusted. As a result, the rural economy has been invigorated. Total product of rural society (Note 3: Total product of rural society embraces agricultural output value under public, collective, or individual ownership; the output value of village and town industries and of industries owned by individuals; and the output value of the building industry, transport and communications services, commerce, and the catering trade. Its growth rate was caluclated at the prices of the year, without taking raised prices into account. For 1985 it was 15.844 billion yuan, a 28.3 percent increase over 1984. Of this, the proportion of rural industrial, building industrial, commercial, and transport output value increased from 34.7 percent to 37.5 percent in 1985.

Total agricultural output value (including village industries) was 12.359 yuan in 1985, an increase of 17.2 percent over the previous year. This growth rate was higher than planned. Forestry, animal husbandry, sideline production, and fishery were further strengthened. The proportion of forestry, animal husbandry, sideline production, and fishery in total agricultural output value increased from 54.4 percent in 1984 to 59.4 percent in 1985. After deducting the output value of village industries, total agricultural output value was 9.905 billion yuan, an 8.4 percent increase over the previous year.

The cropping structure was considerably readjusted. The acreage sown to grain crops was 129,000 hectatres less than in the previous year. In addition, national disasters occurred in the province, and people in some places also relaxed their efforts at grain production. Total grain output was 7,944,000 metric tons, 559,000 metric tons less than in the previous year or a 6.6 percent decrease. All cash crops, except rapeseed, increased by a big margin.

The output of major farm products was as follows:

	1985	increase over 1984 [percent]
Grain	7,944,000 tons	-6.6
of which:		
Rice	6,811,000 tons	-6.8
Wheat	216,400 tons	-12.0
Tuber Crops	805,100 tons	-3.5
Oil-bearing Crops	173,900 tons	9.8
of which:		
Peanuts	163,400 tons	10.9
Rapeseed	9,500 tons	-6.1
Sugarcane	5,366,700 tons	13.4
Jute, Ambary Hemp	15,600 tons	96.9
Cured Tobacco	34,000 tons	39.0
Tea	40,500 tons	14.9
Fruit	494 100 tons	21.9

The further implementation of the forestry policy further enhanced the masses' enthusiasm for forestry production. Forested areas in the province covered 282,800 hectares. Output of major forestry products topped that of 1984. Output of tea-oil seeds was 3.27 tons, an increase of 38.4 percent over 1984.

Animal husbandry continued to develop. Increases were registered in the output of pork, beef, mutton, milk, poultry, and eggs, as well as in the numbers of pigs and cattle at the end of the year.

Output of major animal by-products and numbers of livestock was as follows:

	1985	Increase over 1984 [percent]
Output of pork, beef and mutton	441,800 tons	17.6
of which:		
Pork	434,800 tons	17.6
Milk	41,700 tons	17.8
Hogs slaughtered	5,780,900 head	12.2
Pigs in stock at year-end	8,368,100 head	7.3
Cattle in stock at year-end	1,184,200 head	3.1
Sheep and goats in stock at year-end	611,000 head	-2.5

Fish production continued to grow. The output of aquatic proucts was 760,000 tons, up 14.3 percent from 1984. Of this, the total catch of marine products was 711,800 tons, up 12.6 percent, while that of freshwater products was 48,000 tons, an increase of 46.1 percent. Of the total output of aquatic products, production of aquiculture was 243,200 tons, up 19.2 percent.

Farm machinery and rural electric power continued to increase. At the end of 1985 the aggregate power capacity of Fujian's farm machines had reached 5,096,500 horsepower, an 8.8 percent increase over 1984. The number of small tractors and walking tractors was 99,900, an increase of 11.1 percent over 1984; trucks, 7,400, an increase of 28.6 percent. The total consumption of electricity in rural areas was 1.124 billion kwh, an increase of 25.9 percent over 1984.

The province's meterological departments improved their weather forecast work and made new contributions to agricultural production and production in other fields. Their good work also reduced losses to agricultural production caused by natural disasters.

However, the province's cultivated acreage decreased in 1985, and its irrigation facilities continued to deteriorate. Therefore, it is necessary to upgrade the province's capability to overcome natural disasters.

2. Industry

Industry continued to develop in 1985, amidst reform and opening to the outside world. Enterprises increased their vitality, light and heavy industries moved ahead fairly rapidly, there was a substantial increase in the output of readily marketable products, and economic results also rose.

The province's total industrial output value for 1985 was 14.895 billion yuan, an increase of 21.6 percent over 1984 -- a pace that exceeded the planned growth target of 10.6 percent. When added to the output value of rural industry run by villages and units lower than the village level, the total figure would be 17.313 billion yuan, a 25.4 percent increase over 1984. Of the total, the output value of state-owned industry increased 14.9 percent over the previous year, collectively owned industry grew by 29.9 percent, privately owned industry expanded its output value by 290 percent, and industry of other kinds of ownership rose by 50.1 percent. The output of 55 of the 72 major industrial products met or topped state plans, accounting for 76.4 percent. Seventeen industrial products failed to meet their 1985 planned quotas, including sulfuric acid, phosphate fertilizer, chemical insecticides, rosin, microcomputers, and crude salt.

The total light industrial output value in 1985 was 8.834 billion yuan, an increase of 20.9 percent over the previous year. The relatively rapid increase of high-grade, medium-grade, famous brand, and fine quality products contributed to improving the supply situation on the market. The variety in color and design of light industrial products continued to increase. Products that sold well on the market increased by relatively large margins.

The output of major light industrial products was as follows:

	1985	increase over (percent)
sugar	479,400 tons	39.7
canned food	133,300 tons	23.2
cigarettes	462,700 cases	17.8
beer	46,900 tons	78.3
crude salt	780,000 tons	-12.6
machine-made paper and cardboard	368,400 tons	20.2
synthetic fiber	16,500 tons	59.7
cotton cloth	154,000,000 meters	14.3
silk textiles	14,760,000 meters	13
bicycles	491,400 units	34.7
plastic products	97,800 tons	15.2
refrigerators	32,800 units	71
washing machines	42,300 units	130
audio recorders	654,700 units	315
television sets	589,500 sets	25.3
of which:		
color tv sets	406,000 sets	26.8

The total heavy industrial output value in 1985 was 6.025 billion yuan, an increase of 22.8 percent over the previous year. The situation in power output was relatively good. The output of items in short supply increased by a relatively large margin. However, the gap between supply and demand in energy and raw and processed materials was still relatively large.

The output of major heavy industrial products was as follows:

	1985	increase over 1984 (percent)
coal	6,065,300 tons	5.3
generated energy	7,720,000,000 kwhs	14.3
steel	317,500 tons	10.6
pig iron	379,900 tons	8.4
steel products	263,200 tons	4.6
lumber	4,617,600 cubic meters	10.1
resin	51,800 tons	-8.4
cement	2,906,900 tons	24.2
plate glass	1,053,100 cases	24.7
sulphric acid	129,400 tons	9.1
caustic soda	64,100 tons	8.3
chemical fertilizer	328,800 tons	1.6
plastics	41,000 tons	10.0
chemicals	460 tons	23
generating equipment (above 500 kw capacity)	38,100 kw	120
small tractors	19,600 units	10.3

Following the development in depth of industrial structural reform with simplification of administration, delegation of power, and invigoration of enterprises as its central tasks, enterprises increased their ability to improve themselves and develop, and industrial economic results continued to improve. The average per capita output of state-run industrial enterprises was 13,036 yuan, an increase of 13.3 percent over 1984. The consumption of raw and processed materials as well as energy for major products under provincial supervision dropped as compared with the previous year. Profits and taxes turned in by state-run industrial enterprises increased 31.7 percent over 1984. The capital turnover rate was 7.8 percent faster than in 1984. However, the fixed cost of products increased 5.5 percent; the quality of some products dropped; and not all enterprises were able to make up deficits and show profits.

The state-run industrial enterprises established various forms of economic responsibility systems. The switch-over from turning in profits to paying taxes was further implemented. The percentage of state-run industrial enterprises which paid taxes in 1985 instead of turning in their profits grew to 81.1 percent from 75.3 percent in the previous year.

3. Foreign Economic Relations and Tourism

Foreign trade increased by a large margin in 1985. The province's total imports and exports in 1985 was U.S. $1.091 billion, an increase of 63.9 percent over the previous year; of this, total exports were U.S. $491 million, an increase of 13.3 percent over 1984, and total imports were U.S. $600 million, an increase of 147.9 percent over 1984.

The use of foreign capital continued to increase. Some 403 new contracts involving a total of U.S. $439 million in foreign capital were signed by the province in 1985, representing an increase of 73 percent over 1984. Of this total, U.S. $377 million were direct investments from abroad, representing an increase of 87 percent over the previous year. The actual figure of foreign capital used in the whole year was U.S. $177 million, an increase of 186 percent over 1984.

The province last year examined and approved 108 reports on the feasibility of importing various technologies and equipment, which involved a total investment of 433 million yuan. We also signed 305 contracts on importing technologies, and technologies imported according to 125 of these contracts had been put into operation by the end of last year. Eight of the 125 contracts involved $1 million in foreign exchange each.

We also made progress in promoting economic and technical cooperation with foreign countries last year. We signed 74 contracts for various overseas projects and providing labor to foreign countries, which involved $42.54 million. Some $17.28 million of this was completed, 3.35 times more than the previous year. Our tourist industry also developed quite rapidly. In 1985, we received 355,800 people from 57 countries and regions who came for sightseeing, visits, and various exchange activities, up 31.5 percent from the previous year. Of these visitors, 76,700 were foreigners, a 42.5 percent increase over the previous years; 279,100 were Overseas Chinese and Macao and Hong Kong compatriots, an increase of 28.9 percent over the previous year. Tourist industry earnings totaled $28.34 million last year, 24.3 percent more than the previous year.

The Xiamen Special Economic Zone and the Mawei Economic and Technological Development Zone further expanded their economic and technical relations with foreign countries. Foreigners, Hong Kong, Macao, and Taiwan compatriots, and Overseas Chinese who came to Xiamen for business, visits, meetings, and sightseeing totaled 84,700 people, 41.2 percent more than the previous year. Last year, we signed 105 contracts with foreign firms on setting up Chinese-foreign joint ventures, Chinese-foreign cooperative enterprises, and foreign-owned enterprises, with a total investment of $242 million. Seven of these 105 investment projects involved more than $10 million in foreign investment each. They included the Xiamen International Bank, the Hulishan Hotel, and the XIAMEN Polyester Fiber Corporation. The sand blowing [Chui sha 0706 3097] project in Qingzhou, an infrastructure project of the Mawei Economic and Technological

Development Zone, was completed ahead of schedule, leveling an area of 2 square kilometers. Five roads totaling 3,600 meters in the zone were also completed and opened to traffic.

4. Communications and Posts and Telecommunications

Communications departments made relatively good progress in the course of reform. Transportation capacity was enhanced, and passenger and cargo transportation volume increased considerably. Total turnover of cargo handled by railways, highways, ships, and barges in the province reached 12 billion metric ton-kilometers, up 11.5 percent from the previous year. Of this total turnover of cargo, 8.243 billion metric ton-kilometers were handled by railways, an increase of 18 percent; 991 million metric ton-kilometers were handled by highways, an increase of 10.2 percent; and 2.77 billion metric ton-kilometers were handled by ships and barges, a decrease of 3.8 percent. Cargo transported by civil air service totaled 3,794 metric tons, 31.2 percent more than the previous year; and cargo handled by major ports amounted to 9.13 million metric tons, up 4.2 percent from the previous year.

The total turnover of passengers carried by railways, highways, ships, and barges was 10.449 billion man-kilometers, an increase of 16.6 percent over the previous year. Of this total turnover, 3,525 billion man-kilometers were carried by railways, an increase of 17.7 percent; 6.635 billion man-kilometers were carried through highways, up 16.6 percent; and 289 million man-kilometers were carried by ships and barges, an increase of 5.1 percent. Passengers traveling by civil airliners totaled 176,900, 47.7 percent more than the previous year.

We also made considerable progress in posts and telecommunications in 1985. Total revenue earned by the industry exceeded 89.35 million yuan, up 25.9 percent from the previous year. Revenue earned by mail service increased by 15.7 percent; revenue from distributing newspapers and periodicals increased by 13.8 percent; revenue from telegraph services increased by 30.4 percent; and revenue from long distance telephone service increased by 37.9 percent. Urban households installed with a telephone reached 54,700 at the end of last year, 192 percent more than that at the end of the previous year.

The economic results of communications and posts and telecommunications departments continued to improve last year. The overall productivity of the railway transportation industry increased by 10.7 percent over the previous year. The average daily production volume of each locomotive used for driving a cargo train increased by 1.1 percent over the previous year. The fuel consumption of steam locomotives in completing each 10,000 metric-ton kilometers of transportation decreased by 0.5 percent over the previous year. Profits earned by the industry in 1985 increased by 38.1 over the previous year. The annual output of each metric ton of coastal freighters of the province increased by 2.5 percent over the previous year, and the utilization rate of these freighters increased by 9.4 percent. Profits earned by the posts and telecommunications industry increased by 76.7 percent over the previous year. Nevertheless, current communications and transportation capacities still cannot meet production and circulation needs.

5. Fixed Asset Investment and Construction Industry

In 1985, the system to administer fixed asset investment was further improved, construction of capital projects was accelerated, and more efforts were devoted to modernizing existing enterprises. Some 5.428 billion yuan was spent on fixed asset investment in urban and rural areas last year, 1.985 yuan more than the previous year, an increase of 57.6 percent. Of this investment, 3.71 billion yuan was invested by public-owned units, up 76.1 percent from the previous year; 889 million yuan was invested by collective-owned units in urban and rural areas; and 828 million yuan was invested by individuals. Of the fixed asset investment made by public-owned units, 2.676 billion yuan was invested in capital construction projects, an increase of 83.7 percent over the previous year. Some 549 million yuan invested in these capital construction projects was included in the state budget, an increase of 28.9 percent.

In 1985, we continued to build infrastructure projects in order to prepare for future development. Of the total capital construction investment, 532 million yuan was invested in the energy industry, 203 percent more than the previous year; 183 million yuan was invested in the communications and posts and telecommunications industries, an increase of 27.1 percent; and 184 million yuan was invested in education, an increase of 49.6 percent.

Thirty-six large and medium-sized capital construction projects were undertaken last year. Eleven of these projects have been completely or partially put into operation; they include the Yongan thermal power plant and the Qingyang sugar mill. Major output generated by the completed capital construction projects included: 120,000 metric tons of coal; 202,300 kilowatts in generator capacity; 62.86 kilometers of power transmission lines (110,000 volts or above); 2.89 million cubic meters of timber, 44,000 metric tons of cement; 26,000 metric tons of machine-made sugar; and 158,900 school seats.

Development in the Xiamen Special Economic Zone was speeded up, and the investment climate was further improved in 1985. Some 759 million yuan was invested in capital construction projects in the zone last year, 81.1 percent more than the previous year. It also increased its fixed assets by 400 million yuan, an increase of 235 percent. Floor space completed last year amounted to 991,500 square meters, 10.4 percent more than the previous year. The Mawei Economic and Technological Development Zone also made new progress in the construction of infrastructure projects. Projects involving 75 million yuan were completed in 1985.

More efforts were devoted to modernizing existing enterprises last year. Pulbic-owned units invested 849 million yuan in this work in 1985, 45.5 percent more than the previous year. Of this investment, 533 million yuan was invested in increasing product variety and improving product quality, an increase of 63.5 percent over the previous year; 81 million yuan was invested in reducing energy and raw material consumption and in improving product quality, and increase of 39.7 percent. Modernization programs were undertaken on 2,200 projects last year, and 1,114 of them were completed and put into operation.

We deepened our efforts to restructure the construction industry last year, which resulted in more rapid development of the industry. The contract responsibility systems in various forms was implemented on 1,105 of the 2,384 construction projects undertaken by local and state-run construction companies in 1985, which brought better economic results. Output value accomplished by these companies totaled 492 million yuan in 1985, up 23.8 percent from 1984, and their overall productivity increased by 14.9 percent.

New progress was also made in the geological field last year. Our geological workers completed 170,700 meters of drilling in geological prospecting, 34.9 percent more than the previous year. Newly discovered mineral reserves included 30.22 million metric tons of coal, 29.67 million metric tons of limestone, and 7.42 million metric tons of iron ore. In addition, we discovered 15 major mineral sources which are relatively large in size and have good geological conditions for prospecting.

6. Domestic Trade and Supply of Materials

Urban and rural markets thrived in 1985. Retail sales reached 10,709 million yuan, a 26.1 percent increase over the previous year, and after allowing for price rises, an actual increase of 14.0 percent. Of total retail sales, consumer goods amounted to 8,683 million yuan, 27.6 percent more than 1984, and farming materials and equipment totaled 1,105 million yuan, topping the previous year by 5.7 percent. Sales of major consumer goods increased by relatively big margins, including grain, 3.4 percent; edible vegetable oil, 3.8 percent; pork, 4.0 percent; eggs, 37.3 percent; sugar, 19.4 percent; woolen fabrics, 71.9 percent; silk, 23.2 percent; bicycles, 29.2 percent; cameras, 28.9 percent; electric fans, 87.0 percent; TV sets, 83.2 percent; audio tape recorders, 250 percent; washing machines, 92.9 percent; refrigerators, 270 percent; knitted underwear, 64.1 percent; and cloth, 18.7 percent.

Commercial structural reform developed significantly, and a new multi-channel commercial system with various economic forms emerged. By the end of 1985, the state had decontrolled 32 second-level industrial goods wholesale centers; a total of 1,078 small state-owned enterprises in the retail business, the catering trade, and other service trades were delegated to collectives -- turned over for collective ownership or leased to individuals. These accounted for 55.5 percent of all small enterprises. The number of urban and rural commodity fairs increased from 1,306 in 1984 to 1,359 in 1985. Trade value in 1985 amounted to 2,118 million yuan, a 34.8 percent increase over the preceding year. Retail sales in all economic sectors increased considerably. The total amount of retail sales in the state-owned sector grew 17.7 percent and amounted to 4,023 million yuan; retail sales in the collective sector totaled 3.96 billion yuan, an increase of 18.1 percent over 1984. Sales in the individual sector went up by 60.2 percent to total 1,703 million yuan. Sales in othe economic sectors rose by 720 percent to 102 million yuan, while retail sales by farmers to nonagricultural residents went up 42.4 percent to reach 921 million yuan.

The major step of pricing reform progressed smoothly, but market prices rose considerably. The general retail price index in 1985 increased 10.6 percent over 1984. Of that, the general retail price level, being influenced by the readjustment and decontrol of commodity retail prices for some farm and sideline products, rose 6.6 percent. The general retail price level, influenced by other factors, also went up by 4 percent. The general retail price index in the cities rose 14.4 percent and 6.7 percent in the countryside. The price of grain rose by 4.4 percent; fresh vegetables, 35.6 percent; meat, poultry, and eggs, 18.2 percent; aquatic products, 42 percent; fruits, 38.7 percent; articles for everyday use, 4.1 percent; books, newspapers, and magazines, 19.3 percent; and fuel, 3.8 percent. Retail prices of garments and cultural and recreational goods increased slightly as well. Prices of farming materials and equipment grew 5.6 percent. The cost of living index for workers and staff went up 14 percent, of which the price index of consumer goods increased by 14.4 percent; the price index of services rose by 10.1 percent, and the general purchasing price index of farm and sideline products increased 16.4 percent on the average over the preceding year.

The market for means of production was brisk. Material supply departments in Fujian increased their procurement by 31.5 percent and sales volume by 30.8 percent over the previous year, including sales of pig iron, 13.6 percent; rolled steel, 14.9 percent; and cement, 5.4 percent. The rate of circulating expenses dropped from 5.2 percent in 1984 to 4.7 percent. The turnover period for circulating funds decreased by 11 days. Coal sales by fuel supply departments in Fujian increased by 3.3 percent.

7. Science, Education, and Culture

Science and technology advanced amid reform, making fresh contributions to economic development in 1985. Popularization of scientific and technological projects yielded improved economic results. The ranks of scientists and technicians also continued to swell. In 1985, 143,500 natural science professionals and technicians were employed in state-owned enterprises in Fujian, 8,700 more than in 1984. There were also 165,400 people working in social sciences, 8,200 more than in the previous year.

Education continued to develop in the course of reform. In 1985, there were 1,064 postgraduates, 28.7 percent more than in 1984, studying in the province; 324 completed graduate school in 1985, a 10-fold increase over 1984. Universities and colleges enrolled 17,900 students in 1985, 5,710 more than in 1984. Graduates from these schools totaled 7,900 in 1985, 292 more than in 1984. They had a total student body of 44,100 last year, 10,100 more than the year before. Adult higher education institutions enrolled 22,800 students last year, 13,100 more than 1984. Total student body increased to 39,600, 15,100 more than the year before. Graduates from these schools totaled 4,500 last year, 2,300 more than 1984.

Restructuring continued in secondary education. In 1985, there were 95 secondary technical schools with a total enrollment of 43,400, increasing by 7,216 as compared with 1984. The number of senior middle school students was 199,000 -- 20,800 more than the previous year. The number of junior middle school students was 900,200 -- 58,700 more than in 1984. Agricultural middle schools and vocational middle schools had 55,200 students, 16,100 more than in 1984. The ratio between the total enrollment of senior middle school level vocational and technical schools and the total enrollment of regular senior middle schools was 33:67.

Primary school education was further popularized and developed. There were 26,600 primary schools in the province in 1985 with a total enrollment of 3,724,000 -- 37,200 more than in 1984. Of school-age children, 97.3 percent attended school in 1985. Kindergartens in the province had 520,300 pupils last year, 30,200 more than the year before.

Cultural units, cinema, and the media played an important role in building socialist spiritual civilization. There were 3,669 film projection units in the province in 1985, increasing by 142 as compared with the year before. There were 104 full-time performing art troupes, 65 public libraries, 78 cultural clubs, 24 museums and memorial halls, 3 radio stations, 36 radio transmitting and relay stations, 3 television stations, and 10 television transmitting and relay stations, each with a capacity of over 1,000 watts. In 1985, the province published 358 million copies of newspapers, up 27.4 percent from 1984; 33,751,000 copies of magazines, up 38.3 percent from 1984; and 156 million copies of books, up 31.1 percent from 1984.

8. Public Health and Sports

Public health work was constantly strengthened in 1985. The number of hospital beds in the province reached 52,000 by the end of the year, an increase of 2.1 percent as compared with the end of the previous year. Professional health workers numbered 74,200, up 3.7 percent as compared with 1984. The total included 27,000 doctors, an increase of 4.2 percent; 17,000 nurses and midwives, up 2.3 percent. Further progress was made in mother and child care and in the prevention and trreatment of diseases.

In 1985, Fujian's athletes won 53 gold and 24 silver medals in major international competitions. Six of them won four world championships. Fujian's athletes also won 42 national championships. Three of them broke three national records on nine occasions. Thirty-seven athletes broke 61 provincial records on 64 occasions. In 1985, 780,000 people in the province met the requirements prescribed by the "State Standards for

Physical Culture and Sports Training," 11 athletes won the honor title of state master sportsman, and 22 athletes won the honor title of master sportsman. Mass sports activities were further promoted.

9. Living Standards

Living standards in both the cities and the countryside were improved in 1985. A sample survey of peasant families showed an average annual per-capita net income of 396 yuan (including 353 yuan from productive activities and 43 yuan from cash and acricles remitted or brought back by family members working away from home and relief funds issued by the state), 51 yuan or 14.9 percent more than the previous year. The actual increase in income was 10.6 percent after adjustment for rise in prices. However, our economic development was quite uneven. In some localities with slow economic development, the people's livelihood was still difficult, In some old revolutionary base areas, minority nationally regions, border regions, and poor regions and on some islets, the people's basic needs in food and clothing had not yet been satisfied.

A sample survey of urban households showed an average annual per-capita income of 672.52 yuan for expenses in 1985, an increase of 24.9 percent over 1984. After adjustment for the rise in the cost of living, the actual increase was 9.5 percent.

In 1985, jobs were given to 164,000 people in urban areas. The province had 2,741,100 workers and staff by the end of the year, 113,300 more than at the end of 1984. Self-employed workers in the cities and towns totaled 137,600, an increase of 46,100 over the previous year. Annual wages (Note 4: including subsidies issued to compensate for higher commodity prices) of workers and staff in the province totaled 2,903 million yuan, up 24.1 percent from 1984. The average annual cash wage for workers and staff was 1,100 yuan, 19.4 percent more than 1984. The actual increase in workers' wages stood at 4.8 percent, factoring in the cost of living increase.

Urban and rural savings deposits increased greatly. By the end of 1985, individual bank savings amounted to 4,759 million yuan, 34 percent more than the 1984 year-end figure. Housing for both urban and rural residents improved, and per-capita floor space increased.

Social welfare improved. In 1985, there were 307 social welfare institutes in the province, providing for 5,400 people. Urban and rural collectives provided for 42,400 elderly, disabled, widowed, and orphaned people.

10. Population

In 1985, the province had a population of 27,131,000.

Note: the figures in this communique are based on preliminary annual statistics. They do not include the figures for Jinmen County and Mazu Island of Lianjiang County. The total product of society, total industrial and agricultural output value, and the national income in this communique were computed according to 1985 prices. The increases over the previous year were calculated in terms of comparable prices.

BRIEFS

INCREASE IN PER-CAPITA INCOME--According to BEIJING WANBAO, the urban per-capita national income of our municipality ranked second among the 29 provinces, municipalities, and autonomous regions of the country, next only to Shanghai. This information was released by (Xu Yiliang), director of the municipal Statistical Bureau, at a press conference held today. During the past 5 years, although the population of our municipality increased from 5.104 million in 1980 to 5.725 million in 1985, various aspects of the people's lives showed great improvement. Calculated on the basis of permanent population, the per-capita national income reached 2,040 yuan. In terms of comparable prices, this showed a 47.4-percent increase over 1980, averaging an annual increase of 8.1 percent. In 1985, the average wage of the staff members and workers throughout the municipality was 1,343 yuan. This showed a 34.4-percent increase over 1980, when price subsidies were added, and price rises were considered. The average annual increase was 6.1 percent. Such a high growth rate was rare since the founding of the PRC. [Text] [Beijing City Service in Mandarin 0900 GMT 9 May 86] /12640

WENZHAI BAO EXAMINES EXTERNAL INTERFERENCE IN PRODUCTION

HK010837 Beijing WENZHAI BAO in Chinese No 306, 24 Apr 86 p 2

[Article by WENZHAI BAO Reference Office: "What Can a Factory Do With So Many 'Mothers-in-law'?"]

[Text] A certain brewery invited comrades from as many as 30 other units to attend a meeting to verify the feasibility of expanding its workshop for the production of brand-name wine. Why were so many guests invited? The director of the plant said: "All these units are 'mothers-in-law' of our factory. If any of them is not invited, it will be offended and will play underhand tricks against us. Therefore, we had no alternative but to invite all our 'mothers-in-law' and 'grandmothers-in-law'!"

The plant director continued to say that on the eve of the Spring Festival in 1982, a unit under the City Power Supply Bureau came to ask for 500 bottles of good wine. Since we did not have sufficient good wine to meet the needs of the Spring Festival, we refused to give the wine to this unit. Not long after, the unit informed us by telephone that power supply would be suspended. On the following day, our plant told the unit that we agreed to give it 500 bottles of wine as requested and offered our apology. The result was that we were told "power supply will be ensured." On the eve of the Spring Festival last year, the City Coal Company sent someone to ask for 100 boxes of a brand-name wine which had won gold medals. At that time, we did not have enough of such wine and proposed to replace part of the wine it wanted with other wine. The person from the company snatched back his company's introductory letter and left immediately. Not long after, the Coal Company told us that because of short supplies of coal, no more coal would be supplied to our brewery. I was forced to bring 100 cases of brand-name wine with me to the Coal Company to offer an apology before the problem of coal supply was solved.

Various kinds of "mothers-in-law" have made things very difficult for the brewery. In order to meet market demand, the brewery developed a special kind of wine with 35 percent alcohol in the beginning of 1984. To date, this kind of wine has not yet been put into mass production. This has been caused by the dilatory style of work by "mothers-in-law" concerned. To sell our products, we have to obtain permission from price departments at two levels. After this, we still have to get the approval of the quarantine center. We sent some products to them a month ago but we are still waiting for their reply.

NEED CITED FOR REGULATIONS ON ENTERPRISE BANKRUPTCIES

Beijing BAN YUE TAN in Chinese No 5, 86 pp 40-42

[Article by Cao Siyuan [2580 1835 3293]: "There Is a Need for Legal Provisions for Enterprise Bankruptcies"]

[Text] In recent years, we have done considerable work in reforms to enliven enterprises. But so far there has been no effective solution for the problem of unprofitable enterprises going bankrupt.

In one investigation it was found that from 1967 to 1976 a chemical plant with fixed assets of only 10 million yuan had incurred continuous losses to a total of 9.6 million yuan. Since there were no means to impose any restraints, losses increased without letup. In 1977 the losses for the year surpassed the 2 million yuan mark, and in 1982 further increased to 3.67 million yuan, bringing the accumulated total losses of the factory up to 25.8 million yuan, or 2.5 fold more than the fixed assets of the entire plant.

According to reason, this plant had long ago lost all its original capital and was in fact bankrupt, but it continued to exist and as before to run up losses, doubling and redoubling its losses. The main reason for this situation is that our economic management system provides such enterprises with "reassurances." Regardless how chaotic its management, how backward its technology, how obsolete its products, or how poor its economic results, the enterprise seems "endowed by Heaven" with the right to exist; it is immortal because it can always depend on financial subsidies. Some people erroneously believe that this is a display of the superiority of socialism.

As long as we do not have the institution of bankruptcy, enterprises that operate at loss over long periods of time on the one hand occupy or waste the fruits of labor of their creditors without remuneration, do not service debts, and make it a common practice to repudiate debts, throwing the entire socioeconomic order into chaos. On the other hand, the financial subsidies provided for such unprofitable enterprises not only saddle the state with a heavy burden and impede the development of production and the implementation of measures to improve the livelihood of the people, but also, more seriously, foster a mentality among debtors that all responsibility can be shifted to the state, a mentality that hampers efforts to stimulate a sense of responsibility and urgency among enterprises to improve their business management and leads to increased inertia and resistance in the entire business machinery, thereby decreasing economic results throughout society as a whole. Administrative measures are unable to revive the vitality of such enterprises whose continuous losses have brought them to a state of bankruptcy. Here, help can only come from legal measures, i.e., the legislation of an enterprise bankruptcy law, and instituting bankruptcy procedures, to eliminate backward enterprises and encourage progress as the goal in all enterprises.

Instituting bankruptcy procedures means discharging debts while in the state of bankruptcy. Being bankrupt means that the debtor cannot satisfy debts to a creditor on a due date. In the case of an electrical equipment plant, for instance, losses were incurred year after year due to chaotic management conditions. By 1985 its debts to 247 units amounted to 500,000 yuan, while all its property had a value of only 300,000 yuan; it was obviously unable to repay the entire debt of 500,000 yuan. According to an enterprise bankruptcy law, this enterprise should have been declared bankrupt, its property liquidated and used to pay its debts, and it should have been granted a discharge according to law for all debts for which assets would have been found insufficient.

By paying debts in a bankruptcy procedure the debtor on the one hand fulfills all his obligations to the best of his ability, and thereafter is granted a discharge of all previous debts. On the other hand, the procedure protects the legitimate interests of the creditors, ensuring within the limits of what is possible the fulfillment of all obligations and preventing the creditors from getting nothing at all. It may be said that implementation of a bankruptcy law enables the direct disposition of a small number of cases of enterprise bankruptcies, and indirectly embodies the universal principle that debts must be repaid, and therefore serves to protect the interests of the broad masses of the people.

Some say, isn't it a fact that there is no further life for the enterprise after bankruptcy? Precisely. This is what is called "elimination." In commodity production, the objective law of value determines: whatever is low in production costs and suits the requirements of the market will yield larger profits and experience greater development; whatever is high in production costs and unsuitable for the requirements of the market will, quite naturally, yield little profit or even lead to losses. The losses will frequently come to constitute an abnormal indebtedness, and when the indebtedness exceeds the ability to repay, the enterprise will have to be closed down and declared bankrupt.The bankruptcy and elimination of producers of backward commodities is the natural result of the development ofcommodity production, as it is also the necessary factor that will spur on the development of commodity production at a high rate of efficiency. When a bankruptcy law is implemented and backward enterprises have to close down and be declared bankrupt, it is like a silent warning bell and a silent command which calls on the large number of enterprises to actively and vigorously improve business operations and update technology, and by so doing promote the enhancement of economic results and science and technology levels throughout the society as a whole.

If a bankruptcy law is in effect and an enterprise should fall into bankruptcy, the bankruptcy case would be handled by the law court. The management, liquidation and distribution of assets in the bankruptcy procedure will be carried out according to a certain procedure in an orderly way; it will be "dying a good death," and will forestall endless bickering by creditors demanding payment of debts.

When an enterprise goes bankrupt, its assets will be liquidated and distributed among its creditors, while its employees (including cadres) become "job-waiting" personnel. How are their livelihood and career problems to be solved? This is something for priority consideration in a socialist country when drawing up a bankruptcy law. The institution of bankruptcy is closely linked with the question of bankruptcy relief measures. The state will in future have to make clear and definite provisions regarding the accumulation, management and distribution of a bankruptcy relief fund and regarding ways to reemploy staff and workers.

Perhaps some may argue that since this is so, it may suffice to merely dismiss the factory director when his enterprise goes bankrupt. Yet the common worker is also punished. Isn't this being unfair?

Actually, if one would only acquire a true concept of the commodity economy, this problem is not at all difficult to understand. An enterprise as a producer of commodities is the embodiment of the common fate of all its members. An enterprise operating under the conditions of commodity economy is like a ship on the high seas. When it strikes a rock and sinks, even if due to a serious fault of the captain, it will certainly not only be the captain who goes down. We see the same reasoning in the objective law that prevails in the development of the commodity economy. Violating this law will deprive everyone of production enthusiasm. Observance of the said law will have everybody show concern in all operations for the fate of the enterprise because everyone's own vital interests are at stake. China is a socialist state with a constitution that sets forth that the masses are not only workers, but also masters of their enterprises. Hence, there ought to be an even closer bond between workers and enterprise. It is only that the economic system of everybody eating from the same big pot prevents bringing the advantages of the socialist system into full play and suppresses enthusiasm for democratic management of enterprises by workers. Practice has proven that the spirit of being masters can only be built on the foundation of real responsibility, power and interests. If a certain economic loss in connection with the losses and bankruptcy of the enterprise would also have to be borne by the entire body of employees, they are bound to be concerned about the business affairs of the enterprise.

The survival of the fittest enterprises is like metabolism in all things on earth; it is normal and beneficial, and also unavoidable. But, one sided propaganda over a long period of time has created the erroneous concept that bankruptcy of enterprises will result in social turmoil. Dominated by this erroneous concept, a considerable amount of the state's and the people's valuable capital has been squandered year after year as "blood transfusions" to certain enterprises without the slightest vitality, protecting backward enterprises from elimination, and running enterprises as if they were relief or charitable organizations. Practice has proven that this served only to cover up unstable elements, to accumulate such elements and to multiply economic losses. If we are now intent on instituting a bankruptcy system, it is to declare those bankrupt enterprises legally bankrupt. At the same time relief should be provided according to a certain procedure for all unemployed staff and workers who deserve to receive relief. Providing relief is a different matter from running an enterprise. It is only in this manner that consideration could be given to both social stability and economic results.

GUANGDONG GOVERNOR URGES INVIGORATING ENTERPRISES

HK280304 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 27 Apr 86

[Text] At a provincial urban economic structural reform work conference that ended today, provincial Governor Ye Xuanping said that invigorating enterprises is the foundation of economic structural reform. We must make great efforts to invigorate enterprises so as to develop horizontal economic ties.

The governor said that the main role in horizontal economic ties is enterprises. So long as enterprises have their own decisionmaking power and more vitality, they will combine with others of their own accord on the basis of equality and mutual benefit. Economic management departments at all levels, as government organs, cannot take care of everything concerning combinations between enterprises, nor can they enforce enterprises to combine or use administrative means to interfere with combinations. They must act as good go-betweens, provide information, and act as a bridge in combinations of enterprises.

On how to invigorate enterprises, Governor Ye Xuanping said that on the one hand we must give more decisionmaking power to enterprises, delegate power to enterprises, and create conditions externally to invigorate enterprises; on the other hand, we must further implement various reform policies within enterprises and strengthen business management. For example, we may promote the factory manager responsibility system and perfect various economic responsibility systems to invigorate enterprises and raise economic results.

The governor also emphatically pointed out that at present the province should focus on developing horizontal economic ties, on encouraging enterprises to develop the energy, communications, and raw material industries, and on encouraging them to make joint efforts to develop products for export and foreign exchange and products in short supply in the country.

HEILONGJIANG HOLDS CONFERENCE ON INDUSTRIAL PRODUCTION

SK041400 Harbin Heilongjiang Provincial Service in Mandarin 1000 GMT 2 May 86

[Text] The provincial CPC Committee and government held a telephone conference this morning. Hou Jie, governor of the provincial government, presented a plan for grasping the current industrial production at the conference.

The conference held: Our province's industrial growth rate, economic results, and revenue in the first 4 months of this year were not ideal enough. From now on, leaders at all levels throughout the province should shift their attention to industrial production, conscientiously strengthen their organizational leadership over industrial production, and improve and implement the economic contracted responsibility system in order to further vitalize production and management and to facilitate industrial production.

The conference held: There were many reasons or causes for the declines in our province's industrial growth rate and economic results. However, the main reasons were that leaders and economic administrative departments at all levels failed to do their work well; that is, they failed to exercise organizational leadership over industrial production, to carry out the economic responsibility system, or to firmly grasp ideological and political work.

The conference set forth: We should conscientiously enhance the organizational leadership over industrial production in order to solve the problems existing in industrial production. Leaders at all levels should shift their attention to industrial production. The leading bodies of all cities, prefectures, counties, provincial-level industrial and communications departments and bureaus, and companies should immediately and conscientiously study the problems in the current industrial production, analyze the current situation of industrial production, correctly find out where the problems lie, and take countermeasures to firmly solve the problems in order to ensure the fulfillment of the annual targets for increasing output value and economic results.

The conference called on cadres of economic administrative departments to go to the grassroots enterprises to help them study and solve the problems in the current industrial production. Cadres of economic administrative departments should implement the regulations of the provincial CPC Committee and the provincial government on drawing a clear line of demarcation between the unhealthy practices and the formal economic activities of the state, collective, and individual enterprises, and help enterprises study and work out measures for enhancing ideological and political work. In response to the decision of the provincial government on reducing excessive meetings, cadres are given more chances to go deep among the grassroots units.

The conference stressed: From now on, we must link the arrangements for all political activities with the guiding ideology of shifting the whole party's stress of work defined at the 3d Plenary Session of the 11th CPC Central Committee. The departments at all levels should focus their work on serving the four modernizations. Straightening out party style and popularizing education on general knowledge of the law is aimed at the realization of the four modernizations. Thus, we must combine the arrangements for these activities with the thinking regarding how to achieve the current production.

The conference also called on all localities to improve and implement the economic contracted responsibility system in order to enliven the production and management of the enterprises. Through summing up experiences, the enterprises should maintain the advantages and discard the disadvantages to make all effective forms, content, and measures of the contract systems be mutually reinforcing. Acting on behalf of the governments, the management departments at all levels should sign economic contracts with the enterprises in order to assign contracted economic targets to the enterprises as soon as possible.

The conference also set forth suggestions on improving the quality of products, reducing the costs of materials, grasping the sales of products, upgrading economic results, and enthusiastically conducting ideological and political work.

The telephone conference was presided over by Chen Yunlin, deputy secretary of the provincial CPC Committee.

GUIZHOU PLANNING, FINANCE CHIEFS DELIVER REPORTS

HK010125 Guiyang Guizhou Provincial Service in Mandarin 1400 GMT 30 Apr 86

[Excerpts] (Zhou Banghua), director of the provincial Planning Commission, reported to the Fourth Session of the Sixth Provincial People's Congress on the draft economic and social development plan for the province in 1986.

He said: According to the arrangements in the draft plan, total industrial and agricultural output value this year should be 16.2 billion yuan, an increase of 10.7 percent over last year in terms of 1980 prices. Gross domestic product should be 14 billion yuan, an increase of 12.4 percent. National income should be 12 billion yuan, a rise of 11.3 percent. He put forward the following demands:

1. Continue to put agricultural development in an important strategic position and do everything possible to reap bumper harvests. It is necessary to suitably stabilize the sown area of grain crops, keep under control the sown area of industrial crops such as tobacco, and focus on improving yields and quality. We should strive for new breakthroughs in the township enterprises. Townships and villages that have not yet set up enterprises should develop them as quickly as possible. The enterprises already developed should be consolidated and improved. We must appropriately increase input in agriculture and also take effective steps to improve the work of supporting poor areas.

2. Strive to increase output of consumer goods that sell well in the markets. We must also vigorously tap potentials and develop energy, the raw materials industry, and communications and transport.

3. Keep investment in fixed assets under control, rationally readjust the investment structure, and improve the economic results of investment. In accordance with the state's demands, we should strive to base our work on the overall situation and switch our main efforts to tapping potentials, carrying out technological transformation, and improving enterprise management and technical standards.

4. Work hard to earn more foreign exchange from exports and keep under control foreign exchange spending on imports. We must further promote external economic and technical cooperation and exchange.

5. Make proper arrangements for supplying the markets, keep prices basically stable, and continue to improve living standards.

6. Further develop education, science, culture, public health, and sports. We must also strengthen leadership over planned parenthood work and ensure that the natural population growth rate does not exceed 10 per 1,000.

Provincial Finance Department Director (Long Xingyang) said in his report: The province's local budgeted revenue for 1986 is 1.65 billion yuan, an increase of 205 million yuan--13.8 percent--over the final revenue accounts for 1985. The planned expenditure for the year is 2.65 billion yuan.

(Long Xingyang) said: The arrangement for revenue is a positive one, but that for expenditure is rather tight. The contradiction between needs and possibilities is rather conspicuous. In order to fulfill the financial task for 1986, we must make active efforts to arrange things with care and caution.

SICHUAN RIBAO URGES DEVELOPMENT OF LIGHT INDUSTRY

HK221555 Chengdu SICHUAN RIBAO in Chinese 7 Apr 86 p 2

[Commentator's article: "It Is Necessary To Maintain an Appropriate Growth Rate in Light Industry"]

[Text] The situation in our province's light industrial production in the first few months of this year was not good. In the first 2 months, both the output value and the tax-profit contributions of light industry declined as compared with the same period of last year, and production costs increased. Although production increased in March, the total output of the first quarter was still less than the same period of last year. This downward trend in industry did not appear in the previous few years. An important reason for this was that the personnel concerned did not realize the necessity of maintaining an appropriate growth rate in light industrial production and did not effectively direct production as they relaxed their efforts.

At any time, we must not neglect the importance of the growth rate. Practice shows that we cannot seek a high growth rate without guaranteeing good economic results, nor can we give up the efforts to maintain an appropriate growth rate, because this will affect the economic results and state revenue. Moreover, light industrial goods are sensitive goods on markets, because they have close relations with people's livelihood. Once they are in short supply, the people will immediately feel the effects of the shortage and market prosperity and social stability will be affected. As we know, urban and rural residents in our province have markedly increased their incomes, and their purchasing power in 1986 is certainly greater than in 1985. This state of affairs sets a higher demand on our light industrial departments, which are required to supply sufficient quantities of light industrial goods of good quality. Therefore, we must maintain an appropriate growth rate in our light industrial production and must try by every possible means to fulfill the target that the provincial authorities assigned to the light industrial departments. It is only necessary but also possible to do so, because the central and provincial authorities have once again reiterated that priority will be given to light industry and the funds, raw materials, and energy needed in light industrial production will be guaranteed. Meanwhile, the quality of our present light industrial goods is still not good enough, the consumption of raw materials in light industrial production is still rather high, and waste remains serious. If we seriously strengthen enterprise management by adopting some modern methods and effectively solve the above problems, we will tap great potential in our production. In addition, we completed a number of construction and transformation projects last year. They now form the new productive capacity that we can employ. This is also a favorable factor. However, we must point out here that when maintaining a certain growth rate in production, we must also pay attention to improving product quality, enriching the variety of products, developing new products of better quality, and increasing the production of marketable and original products, and we must not shift to produce goods of inferior quality and of limited variety which are not needed or favored by the consumers.

QINGHAI GOVERNOR ON ENTERPRISE PROBLEMS, LIVING STANDARDS

HK270239 Xining Qinghai Provincial Service in Mandarin 2330 GMT 26 Apr 86

[Text] In his report on the Seventh 5-Year Plan, Governor Song Ruixiang stressed: We have formulated a number of policies and regulations in the course of invigorating the enterprises in recent years, and the enterprises have been invigorated to a certain extent. However, there are three outstanding problems that have not been solved well:

1. Some regulations on expanding enterprise decisionmaking powers have not been sufficiently implemented. The old setup of separation between departments and regions and closed-style operations has not been completely dismantled.

2. The enterprises lack a concept of market and competition. As a result, the phenomenon of everybody eating out of the same big state pot has not been completely eliminated.

3. The enterprises' mentality of striving to be large and complete or small and complete and not seeking help from anybody outside has not been completely eliminated.

To solve these problems, we must continue to implement the regulations on streamlining the administration and delegating powers, and truly delegate to the enterprises the powers that should be delegated.

Governor Song Ruixiang said in his report: We must correctly handle the relationship between production and construction on the one hand and improving living standards on the other. We must not one-sidedly stress production and construction and neglect living standards, nor can we improve people's living standards and pay and conditions to a degree in excess of production development. Consumption growth cannot be higher than production growth during the Seventh 5-Year Plan. In principle, the growth of workers' wages cannot exceed the growth of labor productivity. This principle must also be followed when considering and arranging the necessary specially favorable treatment in Qinghai. We must clearly understand that this issue is related to the long-term overall situation of the province's economic development.

We must continue to carry forward the fine tradition of arduous struggle and building the country with diligence and thrift. We must seriously implement the socialist principle of distribution according to labor, mobilize people's enthusiasm, and eliminate egalitarianism. We should allow some people to get rich through legitimate labor, and thus attain the goal of prosperity for all.

SHANXI MEASURES TO CONVERT DEFICITS TO PROFITS

HK260311 Taiyuan SHANXI RIBAO in Chinese 14 Apr 86 p 1

[Report by Wang Xiusen [3769 4423 2773] and Wang Zhongxin [3769 0022 0207]: "Provincial Economic Commission and Financial Department Formulate Six Measures To Encourage Enterprises To Turn Deficits Into Profits"]

[Text] Following the principle of "bring more pressure, stressing policies and providing opportunities," the provincial Economic Commission and provincial Financial Department recently formulated six measures encouraging enterprises to turn deficits into profits.

Last year, the province's number of loss-incurred enterprises sharply increased. The trend continues this year. By the end of February, the number of state-run loss-incurred industrial enterprises in localities totaled 186, an increase of 55 compared to that by the end of 1985. The amount of deficits totaled 8.78 million yuan. In terms of trades, the number of loss-incurred enterprises increased in the chemical industry, machine-building industry, building material industry, light industry, and so on. In terms of places, the amount of deficits increased in Yangquan, Jincheng, Yanbei, Luliang, and other prefectures and cities. Therefore, the provincial Economic Commission and provincial Financial Department pointed out: First, we should establish at various levels the system of contracted responsibilities of turning deficits into profits, as well as the economic responsibility system in the loss-incurred enterprises and departments in charge of the work. If an enterprise fails to act in accordance with the planned progress of turning deficits into profits, the responsible departments at the upper level should deduct proportionally and month by month the wages based on professional titles, floating wages, and even the basic wages of the principal responsible worker. On principle, the proportion of deduction of basic wages should not exceed 20 percent. We should remove from office those responsible people who are incompetent in implementing measures of turning deficits into profits, or who cannot accomplish the work within the specified time but allow the deficits to increase without any particular reason. We should arrange ordinary work for them, instead of appointing them to administrative posts. Second, we should grasp the major loss-incurred enterprises, and strictly control enterprises that face new deficits. The provincial Economic Commission and provincial Financial Department should announce in every quarter the names of major enterprises with deficits over 20,000 yuan. Third, we should help major loss-incurred enterprises strengthen management, improve product quality, and cut back consumption. The economic commissions, financial departments, banks, and other departments at various levels must continue to offer consultation services to loss-incurred enterprises. They should help the enterprises analyze their economic activities and strengthen their economic accounting. Fourth, we should expedite the pace of technological transformation of loss-incurred enterprises. The provincial, prefectural, and county authorities must allocate a certain amount of funds for technological transformation. Financial departments at various levels must use part of their funds as small loans for technological transformation. Based on the method of checking and ratifying the budget deficits of loss-incurred enterprises of that year, we can continue to grant them loans ahead of schedule. Thus, we can concentrate the financial resources, as well as support and expedite the pace of technological transformation of enterprises, so as to promptly achieve the goal of turning deficits into profits. Fifth, we should be determined in closing or merging some of the enterprises, or stopping or changing their production, as the case may be. Sixth, financial, tax, auditing departments, banks, and other departments must strengthen their economic supervision over loss-incurred enterprises.

SICHUAN PLANNING, FINANCE CHIEFS REPORT TO PEOPLE'S CONGRESS

HK010533 Chengdu Sichuan Provincial Service in Mandarin 0030 GMT 1 May 86

[Excerpts] Pu Haiqing, vice governor and director of the provincial Planning and Economic Commission, delivered a report to the provincial People's Congress session on 28 April on the execution of the provincial plan for 1985 and on arrangements for the 1986 plan.

He said: To ensure the fulfillment and overfulfillment of this year's plan, the province should focus on the following eight aspects of work in social and economic development: 1) Continue to get a good grasp of agricultural production and strive for overfulfillment of the planned grain target. 2) Step up ideological and political work for staff and workers to ensure the fulfillment of this year's industrial production targets. 3) Carefully organize the production and allocation of electric power, to ensure supplies for industrial and agricultural production. 4) Vigorously develop urban and rural collective enterprises. Particular attention must be paid to developing collective industry. 5) The functional role of the banking departments must be brought into full play. The work of raising and channeling capital must be grasped well, and the contradiction of extreme shortage of capital should be eased. 6) Further develop lateral economic ties and cooperation based on the principle of mutual interest and benefit and common development. 7) Strengthen controls over investment in fixed assets and continue to control the size of such investment. 8) Seriously implement the principle of consolidation, digestion, replenishment, and improvement, and continue to carry out all-round economic structural reform focused on the cities.

The province scored notable success in economic and social development in 1985. There was a relatively big increase in revenue and expenditure. The budget was balanced with a slight surplus. This was stated by provincial Finance Department Director (Duan Bingren) on 28 April in his report to the provincial People's Congress session on the final accounts for 1985 and the budget for 1986.

Total revenue last year was 8,410,150,000 yuan. After deducting 6,423,210,000 yuan in expenditures and certain other expenses, the province had a total surplus of 555.72 million yuan. Both the budgeted revenue and expenditure for this year are 6,716,570,000 yuan.

(Duan Bingren) said: The task of achieving this year's budget is very arduous. We must therefore strive to do the following tasks well: Further reform the financial setup; bring into full play the lever role of taxation in regulating the economy; do a good job in supporting poor areas; vigorously organize revenue; economize all capital expenditures; carry out a major inspection of taxation and finances; and strive to fulfill the task of subscribing for state bonds.

TIANJIN VICE MAYOR SPEAKS ON INDUSTRIAL PRODUCTION

SK030144 Tianjin TIANJIN RIBAO in Chinese 20 Apr 86 p 1

[Text] On the afternoon of 19 April, Vice Mayor Nie Bichu spoke on the current industrial production at the sixth plenary meeting of the municipal government. He urged the whole municipality, from the higher levels down to lower levels, to seize the golden opportunity of the second quarter for industrial production, heighten the spirit, overcome difficulties, actively make progress, and guarantee a rational growth rate of our municipality's industrial production on the premise of improved economic results.

After analyzing the current situation in industrial production, Nei Bichu pointed out: We should successfully carry out the industrial production in the second quarter in the spirit of "going all out to catch up." In the course of arranging production, we should not only note the unfavorable factors but also favorable conditions and the increasing favorable factors. We are gradually adapting ourselves to the new situations and new problems arising in exercising macroeconomic control. Major difficulties in the supply of funds, foreign exchange, energy and raw materials, which existed earlier this year, have largely been alleviated thanks to the efforts of various fields. The production of a group of goods in short supply has been increased, and a group of new construction and expansion projects will go into operation and yield benefits. In particular, the masses are in a basically stable mood and their minds are at ease. It is totally justifiable for us to carry out industrial production more successfully.

How should we grasp well the current industrial production? Nie Bichu pointed out: First, we should overcome difficulties, actively make progress, and maintain and develop the good trend of sustained growth in our municipality's industrial production. The objective difficulties facing the current industrial production are a normal situation universally existing in the course of macroeconomic control, not an isolated phenomenon existing only for a short period of time. Leading cadres at all levels should have a correct understanding of and mental preparation for this, maintain a good mental attitude and a high morale for making progress through exploration, make a specific analysis of these difficulties, have a good idea of them, mobilize and organize the masses to conquer them, and promote the production of the second quarter and the whole year in a down-to-earth manner. Second, we should further improve and change our workstyles, and continue to strengthen the organization and management of production. Leading cadres at all levels should go into the realities of life and to worksites, and directly solve specific problems in production that may arise at any time. While strengthening the organization and management of production, we should intensify the analysis fo the economic trends, clarify the subjective factors affecting production, and accurately spot problems. All departments and units assigned to solve specific problems should make clear their responsibilities and duties, pay attention to actual results, and refrain from buck-passing, procrastination, and loss of opportunities. Third, we should give different guidance according to different cases, guarantee the key areas, and use our limited financial and material resources where they are most needed. We should mobilize and organize the forces from various quarters, and try all possible means--from the supply of electricity, funds, foreign exchange, and materials, ideological and political work, the deployment of cadres, and the improved responsibility system to various coordinated economic policies--to guarantee the production of goods in short supply and of the key enterprises which produce export products, create large amounts of profits and taxes, and affect the overall economic situation. In this way, the main part of our municipality's industrial production can be stabilized. In the meantime, key enterprises should all the more give play to their role of subjective initiative and never foster an idea of relying on others. Fourth, we should have good organization for the operation of completed projects, step up the production of the projects already put into operation, and make them yield economic returns as soon as possible. In the future, we should be strict when testing and approving construction projects, and never approve and cut the ribbon for any project which fails to yield the designed benefit because of construction problems. Technical transformation projects should reach the designed capacity within 2 years after they are put into operation. Fifth, we should improve and strengthen management. We should expedite the readjustment of product mix, greatly increase the production of the goods urgently demanded in markets, stabilize and upgrade product quality, reduce consumption, and exert great efforts to sell products and collect loans. Sixth, we should strengthen ideological and political work and conscientiously implement the responsibility system. At present, enterprises should use well the various encouraging policies granted by the state and the municipality, assign targets to every subordinate unit, make it responsible for the assigned targets, strictly examine the results, and ensure that industrious units are awarded and lazy ones are punished. We should particularly do a good job in ideological and political work and truly establish the economic responsibility system on the basis of the high awareness of staff members and workers. Seventh, we should show concern for the lives of staff members and workers, and do a good job in production safety. Leading cadres at all levels should try their best to successfully carry out the welfare related to the lives of staff members and workers. In the distribution of the public benefit of enterprises, leading cadres should be examples, and refrain from competing with the masses for more benefit. All units should improve security organizations and preventive measures.

ECONOMIC MANAGEMENT

REGULATIONS ON FIXING PRICES ACCORDING TO QUALITY

Beijing JIAGE LILUN YU SHIXIAN [PRICE: THEORY AND PRACTICE] in Chinese No 6, 20 Nov 85 pp 29-30

[An Outline by Ling Bin [0407 1755]: "Brief Introduction to Regulations on Fixing Prices According to Quality as Issued by the Various Departments of the State Council for the Period January to July 1985"]

[Text] Items of the Machine-Building Industry

The following are the results reported by the Ministry of Machine-Building Industry on 23 January 1985 of a reexamination of the quality of 842 products, which prior to 1983 had been appraised as "nationally excellent" and as "departmentally excellent:" (1) Items found up to standards totaled 625, or 74.2 percent of the total number of all such items. During the period of validity of their "excellent quality" designation, these products must use "excellent quality" markings, so that users may exercise supervision of their quality and to qualify for "excellent quality" and preferential pricing privileges prescribed in relevant documents. (2) Twenty-three products, i.e. 2.7 percent, were not up to relevant international standards or current standards and were disqualified as "excellent quality" products. (3) Twenty-three items, i.e. 2.7 percent, were outmoded products or products produced in small quantities, for which the factories on their own initiative proposed cancellation of the "excellent quality" designation and items which had not yet attained international standards, which, therefore, had to be taken off the list of "excellent quality" products. (4) Forty-five items were officially declared disqualified as "excellent quality" products and were found in need of updating and upgrading, 52 items were not accepted as up to relevant international standards, 10 items were one-time products, and for 41 items the period of validity had expired, making altogether 148 items in this category, or 17.6 percent, of all products under reexamination. (5) Twenty-three products, i.e. 2.7 percent, were still being examined.

Method of Appraising State-Designated Excellent Products

On 8 February 1985, the State Council approved and circulated "Some Provisional Regulations on Enhancing Technological Progress," drawn up by the State Economic Commission. The following is the gist of these regulations as far as they concern the appraisal of products as being state-designated "excellent quality:" (1) The original system of having state-designated "excellent quality" products appraised as such by the State Commission for Quality Awards has now been changed to a system of having the said commission allocate certain numbers of items to be controlled by the various departments, trades and industries, whose quality award committees shall report their appraisal to the State Quality Award Commission for final approval. International standards must be applied in the case of state-designated excellent quality products (except in cases of uniquely Chinese characteristics). The organ authorized by the State Economic Commission to carry out these quality appraisals must establish on examination that the product in question is up to the advanced national level of the last 3 to 5 years. (2) State-designated excellent quality products should be selected from among products that have a major impact on the national economy. Ordinary products should be merely appraised as departmentally excellent quality products. (3) The appraisal and selection of state-designated excellent quality products shall gradually become a regular and scientifically performed practice. It is necessary to strengthen and build up as rapidly as possible a product quality appraisal center at the state level for the appraisal of important products, and to gradually establish a set of scientific sampling, testing, evaluation and appraisal procedures. (4) The supervision and control of state-designated excellent quality products must be improved. If quality declines, prompt measures must be taken to ensure improvement of product quality within a certain time limit, and, if necessary, the state-designation of excellent quality product shall be cancelled for the product in question, and notice of its adverse evaluation shall be circulated.

Grain

The "Plan for the Adjustment of Policy and Prices Governing the Procurement and Sale of Grain and Edible Oil in the Rural Areas," issued by the State Council on 13 March 1985, prescribes that, for the purpose of implementing the principle of higher prices for high quality and lower prices for low quality, all provinces, autonomous regions and directly administered municipalities may, figuring on the 1985 fixed purchasing quota quantities for the three large categories of commodities, and on the premise of not overstepping the general level of the "inverted 3 to 7" price ratio, appropriately raise the price ratio for easily saleable high-quality products and reduce the price ratio for low quality or sluggishly selling products. However, the price of nonglutinous rice must be controlled so as not to exceed the "inverted 2 to 8" proportion, with the wheat of North China not to exceed the "inverted 3 to 7" proportion, while the wheat of South China and the corn in the main producing areas may be allowed to appropriately fluctuate downward, attention being paid to dovetail all prices with those of neighboring areas. Well known high-class rice may be freed from controls, and its pricing left to market regulation. Seed grain produced by farms (households) specializing in the production of high-quality seed grain are not to be included in the system of fixed quotas of contractual purchases, but may be traded by the seed grain departments in charge, and may also be freely bought and sold. Because the principle of higher prices for high quality is to be observed when purchasing grain under fixed quotas, the system of advance mortgaging of certain well known high-class grain types for future procurement is not to be employed.

Coal

In the "Report on the Plan to Broaden the Regional Price Differences of Coal Under Unified Distribution and to Adjust Price Ratios Between Different Types of Coal," drawn up by the State Commodity Price Bureau and the Ministry of Coal Industry, approved and circulated by the State Council on 15 March 1985, it was decided to adjust the price ratios for different types of coal under unified distribution, including adjustments in the price ratios between 17 types of coal, such as coal concentrate, lump and slack coal, as well as the adjustment in the price parities between coking coal, fat coal, lean coal and brown coal. (1) The ratio of washed coal to raw coal was raised from the current 156 to 165 percent. (2) The present price for dressed coal, being 2 percent lower than for raw coal, is very unreasonable. The price for dressed coal will be raised to 5 to 10 percent in relation to raw coal. (3) Coking coal and fat coal are the main types of coal used in China's industry, but resources are limited, and the price ratio of coking coal and fat coal to ordinary coal for motive purposes will be adjusted from 110 to 120 percent. (4) The calorific capacity of lean coal is higher than that of long flaming bituminous coal, but its price is 15 percent lower than the price for long flaming bituminous coal, which is very unreasonable. In future the price parity will be raised from 85 to 95 percent. (5) The price originally fixed for brown coal is excessively low; its price parity will in future be raised from 80 percent to 83 percent.

Urban Public Transportation

In the "Report on the Improvement of Urban Public Transportation" of the Ministry of Urban and Rural Construction and Environmental Protection, approved and circulated by the State Council on 19 April 1985, it is pointed out that newly opened routes over urban main thoroughfares and routes serving mainly tourist traffic shall be equipped with high-quality cars. The principle of higher prices for high-grade service shall be applied, and no monthly tickets shall be sold.

Medical and Public Health Services

In the "Report on Certain Policy Questions Concerning Reforms in Public Health Work" by the Ministry of Public Health, approved and circulated by the State Council on 25 April 1985, it is pointed out that gradual reforms are to be effected in the current irrational system of charges. Presently, it may still prove difficult to carry out a universal adjustment of medical fee standards, and no large-scale adjustments will be carried out in 1985. However, a tariff of charges based on costs may be instituted in certain cases where new instruments and new items of equipment are used and where new medical treatment is given. In the case of newly constructed, renovated or expanded medical units with otherwise favorable conditions, medical fees may be appropriately raised. Sickrooms may be of different classes and charged at different rates. Different tariffs of charges may also be applied in case of special arrangements or at private clinics. In the case of collective or individual medical facilities, medical fees may be more flexible, allowing them a certain margin of profit. The specific items to be adjusted or the extent of adjustments may be determined by the various provinces, autonomous regions and directly administered municipalities themselves according to local conditions.

Coal Gas

The "Report on the Accelerated Development of the Urban Coal Gas Industry" by the Ministry of Urban and Rural Construction and Environmental Protection, circulated by the State Council on 8 July 1985, points out that it is necessary to employ economic levers to arouse enthusiasm for the undertaking of coal gas development, and to follow the principle of higher prices for better quality. The principle on which coal gas pricing must be based is that the prices must preserve the principal investment and must yield a small amount of profit. Charges for civil use of gas must be slightly higher than expenses for burning coal. Charges for gas used for public welfare purposes shall be higher than the price of gas for private use, and rates for industrial use of gas shall be higher than rates for public welfare use of gas. Where the sources of gas are bought at high price, the gas will have to be sold at high price, but pricing must adhere to the principle that prices must be within the limits which the consumers can accept as bearable. Cities that newly undertake providing coal gas must at the start fix reasonable rates for their gas according to the above-stated principles that are to govern price determination.

ECONOMIC MANAGEMENT

BRIEFS

ECONOMIC COOPERATION MEETING HELD--The first joint meeting of the Fujian-Guangdong-Jiangxi border region economic and technological cooperation zone was held at Longyan, Fujian, from 26 to 28 April. Representatives of Longyan in Fujian, Meixian in Guangdong, and Ganzhou in Jiangxi exchanged information on economic development and discussed questions of lateral economic ties between localities and enterprises. Representatives of the three areas and also of the technological consultative services company of the Ministry of Astronautics Industry, who were invited to attend, held extensive talks on technological cooperation projects in railroads, highways, energy, electric power, pottery and porcelain, minerals, grain, technical equipment, and commodity purchase and sales. Letters of intent regarding cooperation in 46 projects were signed. Longyan, Meixian, and Ganzhou constitute the border region of these three provinces. Economic development there has been relatively slow. In January this year, a responsible person of the Meixian Prefectural Commissioner's Office proposed the establishment of the cooperation zone, and this was agreed to by Longyan and Ganzhou prefectures. FINANCE AND BANKING

PRC OFFICIAL ON REFORM OF CHINA'S FINANCIAL SYSTEM

Hong Kong WEN WEI PO in Chinese 21, 22 Mar 86

[Abridged text of speech given by Zhao Haikuan [6392 3189 1401], director, Financial Research Institute, People's Bank of China, at the colloquium "Reform of China's Economic System" at the Asian Studies Center of the Hong Kong University: "Reform of China's Financial System"]

[21 Mar 86 p 10]

[Text] In the course of the reform of China's economic system, reforms were also actively pursued in the banking system. This writer is one of the participants in this reform. With this article I wish to give some introductory information on this reform and also express some views, which may serve students of the reform as reference.

Since the start of the reform of our economic system, and in line with the demands posed to banking work by the state's unified setup and the reform of the economic system, China's banks have indeed implemented a large amount of reform measures, among which the following are the main aspects:

1. The Initial Establishment of a Banking System With Government Administration Separated From Enterprise Management

Prior to the 3d Plenum of the 11th CPC Central Committee, domestic banking business in China was centralized in the People's Bank of China, which was China's currency issuing bank but which also transacted all ordinary banking business.

Since the start of the reform of China's economic system, the bank became burdened with more and more tasks, which made it necessary to set up several specialized banks and other credit institutions to take on certain sections of banking business. Finally, in the first half of 1979, the State Council decided to revive the Agricultural Bank of China as a specialized bank in charge of banking in the rural areas. In the same year, the State Council approved elevating and expanding the position and scope of business of the Bank of China, and, furthermore, decided that investments in capital constructions were gradually to be changed from fund allocations by the finance administration to bank loans, to be granted and managed by the Bank of

Construction. In 1980 the State Council approved the resumption of domestic insurance business by the People's Insurance Corporation of China, which thus became a company to handle all insurance business. Of particular importance was the State Council's decision of 17 September 1983 to have the People's Bank of China assume the special function of central bank, and the establishment of the Industrial and Commercial Bank to undertake industrial and commercial credit and savings bank operations, which formerly had been tasks of the People's Bank. Later, the state again authorized setting up on a nationwide scale more than 30 trust and investment companies at the provincial level. Thus, what basically had taken shape was a new banking system (perhaps to be called a financial system), composed of the People's Bank of China, the Industrial and Commercial Bank of China, the Agricultural Bank of China, the Bank of China, the People's Construction Bank of China, the People's Insurance Corporation of China, the rural credit cooperative societies, the local trust and investment companies and other financial institutions.

In the new banking system, the People's Bank of China is central bank, currency issuing bank and the state organ through which the State Council guides and controls the entire nation's financial affairs. The Industrial and Commercial Bank of China, the Agricultural Bank of China, the Bank of China, the Construction Bank of China, the People's Insurance Corporation of China, the rural credit cooperative societies, and the other financial institutions are financial enterprises to handle certain particular aspects of banking business.

Establishment of the new financial system has created favorable conditions for the invigoration of banking business and for the strengthening of macrofinancial controls. The existence of this plurality of financial institutions helped strengthen guidance of banking business, provided a means of comparison of the quality of business operations among the financial institutions, and by a certain competition between them will increase pressure toward greater business activity and greater efficiency. At the same time, government administration is separated from enterprise management in the new financial system; the People's Bank is a state organ, while all financial institutions are financial enterprises. The People's Bank is, therefore, in a position to concentrate in its work on macroeconomic regulation and on the guidance of all financial work, while the specialized banks are able to employ the methods of enterprise management, to actively pursue various types of banking business, as demanded by the reform of the economic system, and thus to promote the invigoration of the entire economy, on the premise of an effective control of the macroeconomy.

2. Reforming the System of Controlling Credits

In the past, the system of controlling credits in China was highly centralized; deposits received by all banking institutions were centrally held by the head office for distribution and use. For loans, the head office would assign plan quotas, and it was not permissible to switch quotas among different credit requirements. Facts have proven that this system of unified control of deposits and loans, with its excessively meticulous and rigid control by the head office, was not conducive to stimulating enthusiasm among the basic-level banks for increased efforts to obtain deposits or to do a good job of granting credits.

To overcome these drawbacks in the management of credits, to appropriately expand the self-determination of the basic-level banks and arouse their enthusiasm for increased and more effective credit operations, China, from 1979 on, began to manage credits on the basis of a balance between funds taken in and funds being used.

Although the method of control by such balancing is a certain improvement over the centralization of deposits and loans, since the absorption of more deposits will increase funds available for loans, always on the premise of not exceeding the balance, and will be apt to stimulate the enthusiasm of all specialized banks, it also gave rise to a number of new problems. The differential frequently grew too wide, and while the loan deficiency can still be made up, the central bank was unable to effectively control the scope of lending. To further improve the management of funds and strengthen the macrofinancial control, the central bank, from 1985 on, instituted a new method of credit fund control of the specialized banks. By this method the central bank, when determining the annual loan deficiency of the specialized bank, will at the same time set a limit to its loan of funds to the specialized bank. The branch bank of the central bank will then extend loans to the specialized bank within the limits set by its own bank, in line with financial policy and financial strength. The practice of one year has proven that the new method of controlling credits can indeed effectively control the scope of credits.

In addition to the above-stated reform of the system of controlling credits, efforts to invigorate banking business in recent years included the guided opening up of certain credit activities through market regulation, for instance, opening up commercial credits and trying out commercial credits by way of negotiable instruments. Enterprises were permitted to sell merchandise on credit, to advance loans, and also to try out the use of drafts as documentation of an obligation. The drafts could be discounted by banks.

With the approval of the authority in charge, enterprises can issue shares or bonds to raise funds in the market. In 1985 the Agricultural Bank of China and the Industrial and Commercial Bank of China also issued 1-year-term financial bonds at 10.8 percent annual interest.

The basic-level banks may mutually extend short-term loans to adjust mutual fund surpluses and deficiencies.

The trust and investment companies accept entrustments and transfer funds on behalf of units; they will grant loans or make investments according to the parties and for the purposes designated by the principal and according to the capital put up by him. They will act as agents for the issue of shares and bonds, take property in storage, rent out, or act on behalf of enterprises in renting out advanced equipment.

3. Expanding the Scope of Banks for Granting Loans

In this respect, comparatively important reforms have been made in the following areas:

(1) Fixed asset loans. It had been a long-standing rule in China that banks could grant only circulating capital loans, but not fixed asset loans to industrial and commercial enterprises. The role of banks in the fund operations of enterprises was thus limited to a comparatively small sphere, because as capital is being taken up by Chinese state-run industrial enterprises, over 60 percent is in fixed assets while circulating capital amounts to less than 40 percent. This is very detrimental to our socialist construction. Besides, the said rule lags far behind the world trend in banking business developments. Not only is there no such restriction on the banks of the Western countries, but the system has even been changed in the Soviet Union, which had originally introduced the system to us. They all grant circulating capital loans as well as fixed asset loans. In view of these facts, the People's Bank of China broke with the old restriction and began in 1979 to extend loans to enterprises for technological transformations and capital constructions.

The facts have shown that when the banks grant fixed asset loans, because of their widespread organizations and long-standing contacts with the enterprise in connection with deposit, loan, settlements and other business, the banks will be quite familiar with the history and actual conditions of the enterprises, and will as far as possible select loan projects which will yield good economic results. Loans are granted and repaid, interests are collected, and the banks that grant the loans will also have special staff to handle credit business with the enterprises. These staff will be in contact with the enterprises and in a position to exercise supervision over the loans from beginning to end, making sure that the loans will be used in a rational way. Compared with the allocation of funds by the organs of the financial administration, bank loans are more beneficial in that they ensure that the nation's capital funds are being used effectively to invigorate the economy.

(2) Granting loans to individual entrepreneurs. Following the 3d Plenum of the 11th CPC Central Committee, the individual economy made very rapid progress in China, an individual economy which is linked with the system of socialist public ownership. It played an important role in the development of social production, in improving the people's livelihood and in providing additional employment for our manpower, proving itself to be a necessary supplement to the socialist economy. The banks started granting loans to individual entrepreneurs precisely for the purpose of supporting this economic development. There are now many individual entrepreneurs, spread widely over the whole country. As the risk in loans to them is high, lending procedure must be strict. Granting these loans further enriches the loan operations of the banks and raises the responsibility of the banks in their loan operations.

4. Greater Attention to Interest Rates as Effective Lever

Interest rates constitute an important economic lever and an effective means by which the banks can regulate the national economy. However, prior to the

3d Plenum of the 11th CPC Central Committee, interest rates were little differentiated, rate differences were small and the rates were not changed over long periods of time, so that this economic lever was never truly brought into play. Taking the interest rates for loans to urban enterprises as an example, the same interest rates were applied, regardless of what kind of enterprise was involved and what type of loan was given. The interest rates of banks at that time were indeed nothing but "dead levers."

Since 1979, the banks substantially reformed the interest rate system, first of all raising interest rates by a large measure. The following table shows the changes in the main bank interest rates by a comparison of rates at the end of 1985 and at the beginning of 1979:

Types of Interest	1979 Rates (annual)	1985 Rates (annual)	Increase (%)
Deposits by urban and rural individuals:			
Current deposits	2.16	2.88	33
1-year fixed "	3.96	7.20	80
3-year fixed "	4.50	8.28	84
5-year fixed "	5.04	9.36	86
8-year fixed "	-	10.44	-
Circulating capital loans	5.04	7.92	57
1-year fixed asset loans	-	9.36	-

As a second step, interest rates were further differentiated, and a policy of differentiated interest rates was instituted. For instance, additional rates were added among the loans to industrial and commercial enterprises, such as interest rates for fixed asset loans, interest rates for overdue accounts, penalty interests for illegally encroaching on or diverting loan funds, floating interest rates, etc.

The reform of the interest system is playing a positive role in increasing the construction funds of the nation and in promoting the improvement of business management in the enterprises.

5. Introduction of Economic Accounting Systems in the Internal Operation of Banks

Prior to the reform, an erroneous "Leftist" ideology had prevailed in China for a long time with the belief that banks are service and supervisory organs of the national economy and need not bother about their internal trivial accounting. The "small" accounts of banks were thought of as something standing in opposition to the "large" account of the national economy, and no serious attention was ever paid to economic accounting in banks. Since the 3d Plenum of the 11th CPC Central Committee, as the reform of the economic system progressed, there has been some improvement of economic accounting in banks, and starting in the first half of 1979 the "Provisional Regulations Governing Economic Accounting in the People's Bank of China" have been put into effect. These regulations prescribe that all basic-level banks must keep accounts of the utilization rate of credit funds, of work quality, of work efficiency, and of expenses and profits, and it is on the basis of the fulfillment of these norms that they will draw enterprise working funds.

There are, of course, still many problems in the current economic accounting procedure of the banks, problems that await solutions in the theoretical as well as in the practical field. However, it is gratifying that the first step has been taken, thereby laying the foundation for further reforms in the future.

6. Initial Employment of Economic Means To Exercise Macrofinancial Control

After the initial invigoration of the national economy and banking, the People's Bank of China as central bank is now gradually attaching greater importance to the use of economic means for the control of the macroeconomy. It is by increasing or reducing loan quotas to specialized banks, by changes in interest rates and in the deposit reserve fund rate that the bank controls the amount of currency and the scope of loans. In 1984, because of the excessively large capital constructions, consumption funds increased too fast. Furthermore, conditions were not yet sufficiently developed for the exercise of macroeconomic controls by merely economic means, so that controls were ineffective, and the macrofinancial situation got somewhat out of hand. In order to effectively strengthen the macrofinancial control, it still became necessary in 1985 to increase certain administrative means, such as command-style planning in the direct control of the overall amount of lending by the specialized banks, etc., but economic means were also sharing in the improvements and strengthening of controls. For instance, the level and structure of interest rates were adjusted, deposits were scrupulously turned in into the deposit reserve fund, and the earlier mentioned reform of the credit fund management system was carried out. All this has laid an initial foundation for the gradual transition in China to a system of mainly using economic means to effect macrofinancial control.

[22 Mar 86 p 10]

[Text] Progress in the reform of the banking system is determined by progress in the reform of the economic system. In the "Proposal of the CPC Central Committee for the Seventh 5-Year Plan for Development of the National Economy and for Social Development" it is pointed out: "To guarantee the successful realization of the Seventh 5-Year Plan and an even more extended sound and harmonious development of China's national economy, it is most important to act in accordance with the "Resolution" of the 3d Plenum of the 12th CPC Central Committee, namely to move forward, unswervingly as well as carefully and steadily, in our reform of the economic system and to strive to lay the basic foundation for the coming 5 years, or for an even longer period of time, for a socialist economic system with Chinese characteristics, full of vigor and vitality." This is also the principle that is to guide progress in the reform of the banking system. We too must lay the foundation for the accomplishment of the final objective in our banking reform within the above-mentioned period of time. For this purpose, it will perhaps be necessary in the coming reform of the banking system to take further measures in the following directions, basing on the achievements of the first stage of the reform:

1. Improvement of Our Macrofinancial Control To Rely Mainly on Economic Means

The People's Bank of China, in its capacity of central bank, is one of the most important organizations for macrofinancial control. On the basis of the growth rate of the GNP in the particular year, on the probable extent of commodity price increases and on other similar factors, the bank must compute at the beginning of each year at what rate the currency supply will have to be increased. It must, furthermore, compute, according to the historically normal proportion between currency supply and total amount of loans, to what extent the overall amount of nationwide loans must be increased. And again, it must compute, on the basis of the normal proportion between the total amount of loans and the amount of reloans by the central bank, the amount needed by the central bank for its reloans. These factors, after approval by the State Council, must serve as basis for the macrofinancial control to be exercised by the central bank.

Based on the conditions of economic developments and of the currency circulation in the market, the central bank must control, in the course of the year and within the approved amount of its reloans, the overall amount of loans, and exercise this control by means of adjusting interest rates and the rate of deposits required to be made into the deposit reserve fund, and hence control the total amount of social currency supply and achieve the objective of a macrofinancial control.

The inflexible requirement of loans for such procurements as grain and cotton must be made separate items, for which the head office of the People's Bank is to provide funds. For fixed asset loans and township enterprise loans, the specialized banks must be given special quotas, which must not be exceeded without special approval. As to loans for other purposes, these must be provided by the specialized financial institutions within the limits of their own financial strength. Their ability to make loans will depend on the amount of deposits or loan repayments they take in. The central bank will not limit such loans by loan quotas, nor will it be responsible for loans granted by the specialized financial institutions in excess of what was permitted within the framework of the macrofinancial regulation. The specialized financial institutions must also extricate themselves from responsibility for capital requirements they have assumed for enterprises.

The People's Bank of China must strengthen the development of a legal system dealing with financial matters, establish sound financial rules and regulations, and also laws and regulations on auditing and it must also strengthen auditing work. The business activities of all specialized financial institutions shall be subjected to periodical and irregular audits and investigations, and any irregularities discovered shall be severely dealt with, so as to ensure an effective macrofinancial control.

2. Continuous Opening Up and Invigorating of the Economy; Strengthening the Vitality of Our Financial Undertakings

With respect to these problems, we may consider the following:

In view of the objective demands posed by the reform of our economic system and by the socialist construction, we must further expand the scope of business activities of our banks, increase the variety of business operations and broaden the authority of the basic-level banks. All specialized banks shall effectively handle the business of granting loans to state-run and collective-run enterprises, and at the same time actively conduct deposit, loan and account settlement business for the individual economy. They shall completely include the individual economy in the sphere of banking business activities. Commercial credits shall universally assume documentary forms, and the specialized banks shall deal with the business of discounting bills, while the central bank shall rediscount such bills. Further efforts shall be made to increase saving deposits from urban and rural citizens; saving deposits may be handled by all specialized banks, credit cooperative societies and post offices. As soon as possible an electronic computers network shall be set up, credit cards shall be introduced, and depositors shall be afforded more active services by facilitating their deposits and withdrawals. In the settlement of accounts, payment by checks should be tried out in transactions with individual industrial and commercial entrepreneurs and individual persons. In economically developed areas and areas of tourism traveller's checks shall be introduced on trial. The settlement of accounts of neighboring areas with good communication facilities shall be changed from "out-of-town" to local settlements.

When subjected to the macrofinancial control of the central bank, and on the premise of observing the state's credit policy, all specialized financial institutions shall be authorized to grant loans at their own discretion, while at the same time bearing full responsibility for the risks involved in the loans. Within a certain scope, overlapping of business operations between the various specialized financial institutions shall be permissible. They shall be encouraged to compete with each other in attracting deposits, in the service to their customers and in the improvement of their business management, so as to increase external pressures on them and in the interest of invigorating banking business.

With the approval of the People's Bank, the specialized banks and trust and investment companies may issue debentures to raise funds from among society in general.

Commercial drafts may be discounted, debentures may be traded, financial organizations may extend short-term loans to each other. Under the direction and control of the People's Bank, a variety of financial tools may be used to actively develop horizontal financial accommodation and to promote the gradual formation of a capital market.

Where need exists in large and medium-sized cities, credit cooperative societies may be set up to handle deposit accounts, loans, saving accounts, insurance and money transactions for the urban small-scale collective economy and for individual entrepreneurs. As required by the developing economy, and with due approval by the head office of the People's Bank, the establishment of further banks may be considered. All financial institutions must submit to the guidance and control of the People's Bank, must observe state policy and according to regulations make payments to the deposit reserve fund at the People's Bank.

3. Instituting Enterprise-Style Management in Specialized Banks; Increasing and Invigorating Internal Drive in the Banking Business

Whether the specialized banks will be able to institute enterprise-style management is a factor that will decide whether banking business can be invigorated and whether macrofinancial control can possibly be achieved. If it is intended to have the specialized banks achieve enterprise-style management, it is again necessary to provide a correct solution for the problem of coordinating the interests of the specialized banks with the overall interests of the state. In order to encourage people to actively open saving accounts, to turn consumption funds into production funds, to increase the amount of construction capital, to retard purchasing power embodied in these amounts of currency, and to effectively regulate the currency circulation in the market, the state has prescribed under the current system comparatively high interest rates for long-term fixed deposits. From the viewpoint of the overall interests of the state, this is absolutely necessary, but this causes an upside-down situation in the interest rates, which is a detrimental factor in the economic accounts of the specialized banks. The current interest rates for fixed deposits for 3 or more years are higher than interest rates for circulating capital loans, and specialized banks that would take in these long-term deposits would lose money. As to loans by banks, the state prescribes that comparatively low interests shall be charged to enterprises that are well managed, work with low production costs and have quick turnover of capital or which produce products of great significance. Enterprises that are badly managed, work with high production costs, have a slow turnover of capital, and require relatively large loan capital, or enterprises that divert capital to irrational uses or that are unable to repay loans on due dates shall be charged high interest rates. These measures should encourage enterprises to improve their business management and increase manufacture of products needed by the nation. However, if enterprises with good management increase, enterprises with bad management decrease and macroeconomic results improve, the interest income of the banks will decline. In the opposite case, if well-managed enterprises decrease and badly managed enterprises increase, it will possibly increase the interest income of the banks. Under this system of interest rates, instituting free enterprise-style management in the specialized banks will possible have the effect that they will become reluctant to accept long-term saving deposits, as they will in that case rather grant more of the high-interest loans and grant fewer loans for items which might be of the greatest significance for the construction of the national economy, for which they would be required to charge interests at preferential rates. Acting in this manner would harm the construction of our national economy.

To overcome this contradiction, it will be necessary, when conditions have matured, to radically change the current system of interest rates. The central bank shall determine only the key interest rates and the upper and lower parameters of fluctuation, while specific interest rates shall be fixed by the specialized banks themselves within the parameters of fluctuation. Before this is done, the central bank should as soon as possible decide on a procedure to coordinate interests, so that the interests of the specialized banks, when attracting credit funds and when using credit funds, will coincide with the overall interests of the state. By allowing the specialized banks to adopt business activities according to their own interests, we shall implement the macrofinancial policy decision of the central bank and effectively promote the construction of our national economy. We must also establish more or less conformity between the profits of the specialized banks and the extent of their professional efforts; profits computed in proper business accounting will stimulate the business activities of the specialized banks.

FINANCE AND BANKING

STATUS OF FOREIGN DEBTS DISCUSSED

Hong Kong WEN WEI PO in Chinese 10 Apr 86 p 10

[Article by Wu Nianlu [0702 1819 7627], deputy director, International Monetary Research Institute, Bank of China: "The Status of China's International Indebtedness"; an abridged version of a speech given at the symposium "China's Foreign Trade and Investments"]

[Text] Since the 3d Plenum of the 11th CPC Central Committee in 1979, under the general and specific policies of invigorating the domestic economy and opening up to the outside, China has achieved initial successes in the utilization of foreign capital.

The 3d Plenum of the 12th CPC Central Committee in 1984 passed the resolution on the "Reform of the Economic System," thus reaffirming China's fundamental policy of opening to the outside, a principle which was restated by the CPC National Congress in 1985.

Forms of utilizing foreign capital and channels for foreign capital show great diversity. It is intended here to introduce briefly the status of China's international indebtedness and the way it is managed.

During the period of the First 5-Year Plan, due to the economic blockade of China by Western countries, China mainly borrowed from the Soviet Union. These repeated loans, in rubles, amounted to about $1,427,000,000 equivalent in American dollars and served the construction of 156 projects. A part of China's industrial capital constructions has been accomplished with Soviet loans. Principal and interests of all these loans were basically repaid by 1965. At this time, China's economic assistance, loans at low or no interest and gifts of money and materials to certain developing countries amounted to several billion dollars, by far exceeding China's loans from foreign sources.

In recent years, in the wake of China's opening up to the outside and the development of its international economic, trade and technological intercourse, China's loans from Western countries assume a greater diversity of forms. Apart from short-term loans in connection with general import and export trade, China, from 1979 to 1985, signed foreign loan agreements to the amount of $20.3 billion and commodity credit agreements to the amount of $1.762 billion. Of these amounts, $15.6 billion of foreign loan funds and $1.340 billion commodity credits have actually been used. In 1985, the amount of foreign loan agreements was $3.530 billion and of commodity credit agreements $365 million. The following are further details:

1. Loans from International Financial Organizations

China borrowed from the International Monetary Fund $309 million trust fund loans and $450 million first line credit. All these loans were paid back by 1984.

Loans contracted with the World Bank amounted to $3 billion (of which $1.77 billion were hard loans, or 61 percent, and $1.2 billion were soft loan special drawing rights, or 39 percent. The amount of hard and soft loans actually used up to now is only one-third of the total, namely $880 million).

Loans contracted with the UN's International Fund for Agricultural Development amount to $85 million, which are mainly being used for the improvement of the northern grasslands, development of animal husbandry and improvement of saline-alkali soil. Of this loan, only somewhat over $8 million have actually been used by 1985.

Loans from international financial organizations have the advantage of favorable interest rates and extended terms. In the case of the World Bank loan, a systematic, comprehensive and strict system and method governed the selection of the projects in question and their appraisal, and extended to the execution and supervision of all projects, which, moreover, were accompanied by technological assistance, so that the effectiveness ratio of the loan projects and their economic results were very high.

2. Loans from Foreign Governments

At present, the governments or official finance organizations of 15 Western states have agreed to grant China credits amounting to a total of about $5 billion. Most prominent is the $1.5 billion loan for projects of the Japan Cooperation Fund. Japanese loans for energy sources amount to $1.7 billion, and a series of Japanese commodity credits amount to $800 million. The balance is made up of loans or credits from Denmark, Kuwait, Belgium, Italy, Switzerland, Sweden, Norway, Great Britain, France, Austria, Canada, Spain, and Australia.

Government loans are at favorable conditions and for long terms; some stipulate extended periods and low interest rates, some prescribe the scope within which the loans are to be used, some are linked with specific projects, some are to be used as the project progresses item by item. Government credits are granted to promote economic, trade and general friendly relations between the two governments and have a certain assistance nature.

To further promote the development of international trade, foreign loans are used for certain long-term imports for key construction projects. Certain governments use a mixture of government credits, buyer's credits, and loans by banking consortia. This may reduce the overall level of the loan interest rates. Some loans are linked with import projects, and are to be actually used as and when items are imported. Some loans can be freely used. Some of such countries are Japan, Austria, Sweden, Italy, Switzerland, France and Australia.

3. Buyer's Credits

Since 1980, the Bank of China has at different times concluded overall agreements for purchase credits with 10 British banks, 19 French banks, 6 Italian banks and 13 Swedish banks, and also concluded agreements for purchase credits with specific banks in Canada, Australia, Belgium, Norway, Argentina, Denmark, the United States, with the West German Reconstruction Bank and the Export-Import Bank of Japan. For extended loans, the terms were from 5 to 10 years, and interest rates were fixed according to the standards of the OECD organization. Up to now, more than $1.7 billion have actually been used.

4. Loans from Nongovernment Financial Organizations

The Bank of China, the International Trust and Investment Corporation and other financial institutions have concluded short- and medium-term bilateral loan agreements with certain Western commercial banks to raise funds funds and as a source of funds for domestic or foreign exchange loans.

5. Inward Transfer of Deposits from Abroad

The head office of the Bank of China is also bringing in available funds from its overseas branches by attracting deposits from residents in the areas in question and through other means.

6. Raising Funds Through Bonds

From 1982 to February, 1986, China has made 15 bond issues of different nature in Japan and Western Europe to the amount of $1.260 billion. Refer to the following table for details:

DATE	ISSUED BY	AMOUNT (bn)	TERM (yrs)	FACE INT.RATE(%)	ISSUE PRICE	ACTUAL YIELD(%)
Jan 82	CITIC	Y10(p)	12	8.7	100	8.7

Feb 86	CITIC	Y40	10	6.3	99.70	6.349

[NOTE: Issuers are China International Trust and Investment Corp;Fujian Investment Enterprise Co;Bank of China;Shanghai International Trust and Investment Corp. *Deposit certificates with floating interest rates. **Floating interest rate]

It is obvious from the above that the Bank of China, in its capacity of special state bank for foreign exchange transactions, is the main channel for China's foreign loans. In the course of its own business activities, the Bank of China is raising foreign exchange funds at the most favorable conditions possible. The objective of the Bank of China in raising funds is, first, to support the nation's four modernizations, with the main emphasis on the support of projects concerned with the development of energy sources, of the means of communication and in connection with projects for the technological transformation of medium and small scale enterprises, i.e., cases with short turnover of funds and production of export goods which create foreign exchange revenue. A second objective is to supplement the foreign exchange reserve of the state, improve China's ability to make foreign currency payments and to improve its turnover rate.

After several years of practice, we now realize that there are certain favorable conditions for raising loans in the international financial market in the name of the Bank of China. This is so because the Bank of China has developed from its past activities of mainly handling international settlements to a bank of international commerce, a foreign trade bank, investment bank, export credit bank and a foreign exchange bank with a great variety of business functions, mainly raising funds and providing short-term loans and credits, but also engaged in leasing, entrustments, consulting services and investments. The bank has a long history and enjoys a very high international reputation. It has a complement of specialized and well qualified staff and has had many years of experience in raising funds. It has, furthermore, basically established a worldwide organization and agency network, capable of promoting domestic and foreign business activities, and has an excellent understanding of the movements and information in the international financial market, which it utilizes highly effectively.The bank is therefore in a position to raise foreign funds in a planned way at the opportune time, in a variety of forms and through a variety of channels.

As to requirements for short-term loans, the Bank of China, with its modern equipment, maintains close daily contacts with the financial markets of all countries and engages in direct short-term loan transactions with foreign banks.

When raising funds, we combine long-, medium- and short-term funds and, as to interest rates, establish an appropriate proportion of capital at fixed and at floating interest rates. As to the currency of the loans, we consider both the problem of demand for the desired currency and the problem of the risk of its exchange rate.

Utilization of foreign commercial loans is work of a strong political and technical nature; it requires an investigation of the project for which the loan is intended, and requires strict management and supervision, to ensure that the project conforms to the demands of the development of the national economy and can produce comparatively favorable economic results.

Of course, there are borrowers and lenders involved in international loans. At the same time as the Chinese government is utilizing foreign capital, it is also continuing to grant to friendly developing nations a certain amount of economic assistance and loans at favorable conditions. The key policy of the Bank of China in granting loans abroad is that, to the extent that such capital can be absorbed, the loans will actively support China's increased contracting for engineering work abroad, support tourism and also the "three-capital" enterprises (Chinese-foreign joint ventures, cooperative management enterprises and foreign- finance enterprises). But, we demand that China's contracts for engineering projects abroad must as far as possible be projects paid for in cash, and as few as possible, or no projects at all, with extended payment terms. Guarantees provided by the Bank of China must also in future be appropriately controlled, and loans to "three- capital" enterprises must in future primarily support projects which can balance their foreign exchange, which are technology-intensive, which are productive and capable of creating foreign exchange revenue.

FINANCE AND BANKING

HIGHLIGHTS OF 1986 STATE TREASURY BONDS

Beijing CAIZHENG [FINANCE] in Chinese No 3, 8 Mar 86 pp 13-14

[Text] In the interest of a successful issue of the 1986 treasury bonds, the office of the Central Commission for the Issue of State Treasury Bonds compiled an "Outline of Propaganda on Behalf of the Issue of the 1986 State Treasury Bonds," of which the following is a summary:

1. Issue of Treasury Bonds as an Important Measure To Raise Construction Funds

China began at the start of the 1980's to issue treasury bonds, which during these 5 years amount to 23.7 billion yuan and have played a major role in enhancing our key construction and in promoting the development of our national economy.

Today, as the construction of China's socialist modernization enters the period of the Seventh 5-Year Plan for national economic and social development, our situation is in all aspects very good. Industrial and agricultural production is continuously increasing in a steady and proportionate manner, new developments take place in all constructive undertakings, the country's finances are well balanced, and there is a marked improvement in the urban and rural standard of living. Why should we under favorable conditions like these still continue to issue treasury bonds? For the reason that China is still a developing country with a comparatively backward economy. Insufficiency of capital for key constructions will for some time to come still be an acute problem, restricting the development of our national economy. The solution of the problem of insufficient capital for our socialist construction must first of all rely on the various taxes paid by enterprises and by the people to the state treasury; this is the principal measure. Second, we must also issue treasury bonds and utilize foreign capital. Thus, the issue of treasury bonds is one of the major means of the state to raise capital for the accomplishment of the four modernizations. It is for this reason that the State Council, after a full analysis of China's economic condition and developmental trend during the Seventh 5-Year Plan period, decided to continue issuing treasury bonds during the Seventh 5-Year Plan period, to gather in a portion of the social capital and to strengthen key construction that will ensure accomplishment of the strategic tasks outlined for the Seventh 5-Year Plan period.

2. Issue of Treasury Bonds as an Important Means of the State To Effect Macroeconomic Adjustments

The issue of treasury bonds diverts to the state the extrabudgetary funds of the enterprises and a part of the purchasing power in the hands of the people, which means that it will increase investments in the nation's key constructions without increasing the currency supply or the total purchasing power of the society as a whole. It promotes economic development without reducing the wealth of units or of the masses. The issue of treasury bonds is, furthermore, an important means of the state to effect macroeconomic control and to regulate the scope, structure and direction of investments during the ongoing economic construction, to regulate the proportionate relation between accumulation and consumption in the national economy and to regulate the issue and circulation of currency.

3. The Issue of Treasury Bonds Over Long Periods of Time Will Not Increase the Financial Burdens of Units or of the Masses

Some comrades have voiced concern whether the continuous issue of treasury bonds by the state and raising funds from among society at large will adversely affect the technological transformation of the enterprises and the improvement of the living standard of the people. We say that it will not, because China's economy has progressed very fast in recent years, and free capital held by the enterprises and income of the masses has increased very much. Since 1981, extrabudgetary funds throughout the country increased at the rate of over 20 percent per year. It is estimated to have reached an amount of over 140 billion yuan by 1985, increases that exceeded the increases of the state's budgetary revenue. At the same time, there was a steep rise in the country's consumption capital. In 1984 all salaries and wages throughout the country amounted to over 113 billion yuan, an increase of over 19 billion yuan over the preceding year, and an increase at the rate of 20.1 percent, far in excess of the 7.8 percent increase in productivity in industrial enterprises during the same period. Savings deposits of the urban and rural population continuously increased over the last few years. In 1984 alone deposits increased by over 32 billion yuan, and for 1985 it is estimated that the increase will be around 30 percent over that of the preceding year. On the other hand, the treasury bonds issued in 1986 will amount to 6 billion yuan, 2 billion yuan to be taken up by units and 4 billion by individuals. These bonds account for only a very small portion of the state's budgetary revenue, and of the income and saving deposits of the urban and rural population. They will have no adverse effects on the technological transformation of enterprises and on the living standard of the people. Furthermore, from 1986 on, the state will begin to repay the principal and interests of treasury bonds issued in previous years. As the free capital of units and the income of the urban and rural population continuously increase in the wake of the development of production, there is a continuous increase in the capacity of the units and the masses to shoulder financial burdens.

4. Every Unit and Every Citizen Is Duty Bound To Subscribe Enthusiastically to Treasury Bonds in Support of the Four Modernizations

The goal of China's socialist modernization is the continued improvement of the material and spiritual living standards of the people by the further development of production and by raising productivity. Although the excessive scale of extrabudgetary investments in fixed assets and the steep rise in consumption capital have been currently somewhat rectified, no radical change for the better has so far been achieved. No radical solution can possibly be found within a short period of time for the shortcomings in our energy sources, and in the traffic, communications, raw and semifinished materials situation or for the shortages of capital for key constructions. This situation not only hampers economic development and obstructs progress in our reforms, but also has an extremely detrimental effect on the development of enterprises and the further improvements in the living standard of the people. The issue of treasury bonds temporarily borrows a portion of funds now held by units and by the masses to be used to strengthen investments in the key constructions and in the infrastructure of the state, which will lay a solid foundation for the future development of the economy. This is not only an interest of the state, but also a vital long-range interest of every unit and of the whole people. Every unit and every citizen in China is duty bound to subscribe enthusiastically to treasury bonds in support the four modernizations, which would also be the concrete expression of a patriotic spirit.

5. Interest Rates for Treasury Bonds Have Again Been Raised Out of Due Consideration for the Economic Benefits of the Buyers

The purpose of the masses in buying treasury bonds is to support national construction, but the state, on the other nand, also gives due consideration to the economic interests of the buyers. The annual interest rate for treasury bonds bought by units, which last year was 5 percent, has this year been raised to 6 percent. This is higher than the interest rate for fixed deposits for a 3- or more-year period. The annual interest rate for bonds bought by individuals was raised from last year's 9 percent to this year's 10 percent, which is also higher than the bank interest rate for deposits of the same duration. Persons buying 1,000 yuan of treasury bonds will be paid back in one amount after 5 years, and their principal and interests will then amount to 1,500 yuan. Purchases of treasury bonds by units and by the urban and rural masses are on the one hand supporting the four modernizations by practical action, and are also on the other hand providing certain economic benefits. Their purchase is an action that is in the interest of the state and in one's own interest, a good action in that it benefits the state as well as the people.

6. Key to the Successful Accomplishment of the Task of Issuing the Treasury Bonds Is Thoroughgoing and Painstaking Work

Key to the successful accomplishment of the task of issuing the 1986 treasury bonds is the need for governments at all levels to strengthen their guidance of the work of selling the bonds, to have them perform this work in a thoroughgoing and painstaking way and to have them ensure that the task of selling the bonds will be accomplished. For a successful conclusion of the work of selling the 1986 treasury bonds, we shall have to pay attention to the following few questions:

(1) We must conscientiously perform, and perform well, the work of propagandizing and of mobilizing the people. In the last few years, the work of propagandizing and mobilizing the masses has achieved certain successes and has been very effective in ensuring overfulfillment of our tasks, but at some places propaganda is being conducted neither in depth nor painstakingly, but in a dull manner. Some units go in for it in a casual way, giving attention merely to getting over with the task, without any propaganda, so that some people are left befuddled about the significance of the issue of treasury bonds. Leading comrades of the central authorities have repeatedly pointed out that the raising of funds by treasury bonds is an important measure to speed up the four modernizations, and that buying treasury bonds in support of the four modernizations is the duty of every single unit and citizen. These points were again emphasized in the "Regulations Governing the Issue of the 1986 Treasury Bonds of the PRC," issued and circulated this year by the State Council. It is imperative that leading comrades at all levels and all comrades engaged in the sale of treasury bonds transmit this spirit, through whatever channels there are, to the thousands upon thousands of households throughout the country. Wherever there are problems in the understanding of the issue among the masses, it is hoped that the comrades in charge of selling the treasury bonds will provide explanations and clarifications that integrate the particular conditions of the local situation and aim precisely at the problems involved. Currently, all places are conducting education on the present situation. We should combine the work of propagandizing the treasury bonds and mobilizing the masses for their purchase with the education currently being given on the present situation, making propaganda for the issue of the treasury bonds a part of the ongoing education on the present situation. At the same time all places could also make the active subscription to treasury bonds in support of the four modernizations a part of the work of those units that are engaged in building up our spiritual civilization and in education in our ideals, so as to foster among the masses a glorious sense of honor in the enthusiastic subscription to the treasury bonds in support of the four modernizations, and also to arouse the patriotic fervor among the broad masses of the people and thus ensure the accomplishment of the task of selling the treasury bonds.

(2) To accomplish the task of selling this year's treasury bonds, a distributive issue system was employed. The units were allotted their task according to a certain proportion of their extrabudgetary funds or according to the amount of profits after taxes retained by collective enterprises. The urban and rural citizens were allotted their tasks generally according to a certain proportion of their incomes. Every effort should be made to allot tasks everywhere in a rational way. In the case of units, the rational allotment should be based on an investigation of their financial strength. The allotment of tasks to units is of the character of an assigned procurement; it is imperative that each unit attach importance to the overall situation, make advance arrangement for the necessary funds to purchase its treasury bonds and punctually, as required by regulations, pay the required amount to the treasury; there must be no delay. The task of selling the bonds to staff and workers must be based on effective political ideological work. This task shall be allotted to the units in question in accordance with the total amount of salaries and wages of their staff and workers, or in

consideration of the different levels of salaries and wages. The units may fix the allotments for their various teams and groups or for individual employees and workers, using the method of either having their staff and workers voluntarily subscribe or of proceeding on the principle of having each person buy bonds according to his particular larger or smaller capability. No allotment of a purchasing task should be made in the case of the small number of comrades who have genuine difficulties in their livelihood or who have no purchasing power. Every unit or individual must punctually fulfill the purchasing task allotted by the state.

Sales of treasury bonds in the rural areas in the last few years had achieved very good results by a method that combined universal mobilization with sales in key areas. We should continue this sales method in future. In particular, further raising the interest rates for this year's bonds above the bank rates for deposits for the same period of time should make it all the more possible to arouse the purchasing enthusiasm of the many well-to-do peasants and provide favorable conditions for their mobilization to buy more treasury bonds. In case of the general type of places and peasants, each locality may appropriately allot certain treasury bond tasks according to its specific conditions. No treasury bond allotments should again be imposed on poor districts and poor peasants.

The smallest denomination of this year's treasury bonds is again 5 yuan; no purchase balance of any staff, worker or peasant household should be for a smaller amount than 5 yuan. Those unable to make a purchase of 5 yuan may be exempted from purchasing treasury bonds.

3. The work of issuing treasury bonds is a long-term task of the future. Everywhere committees for the sale of treasury bonds and their working organizations should be appointed on a regular basis. Their complement of staff should be relatively stable and where staff is inadequate, it should be appropriately replenished. The financial departments at all levels should act in the spirit of the State Council circular and set up permanent work organizations, staffed with the necessary number of special employees.

4. The work of issuing treasury bonds involves a wide field and requires close coordination between all departments concerned. Especially in the matters of issuing the bonds and of repaying principal and interests, the regulations governing the treasury bonds already stipulate clearly that these matters shall be handled by the People's Bank of China, the Industrial and Commercial Bank of China, the Agricultural Bank of China, the Bank of China and their subordinated organizations. In its circular regarding the regulations governing the 1986 treasury bonds, the State Council had clearly pointed out: "Banks at all levels shall incorporate the work of issuing treasury bonds into their regular business operations, and perform this work conscientiously and efficiently. The propaganda departments at all levels shall work in close coordination and strengthen their propaganda and guidance work." It is therefore hoped that the comrades in the departments concerned will conscientiously implement the spirit of the State Council circular, further strengthen cooperation and jointly do a good job of issuing the treasury bonds.

5. If some people do not want to buy treasury bonds at their units, but rather buy them directly at banks, this is permissible. All banks shall render facilities and maintain secrecy for direct buyers in the same manner as in the case of saving deposits.

SHANGHAI EXPANDS SHIPBUILDING, SHIPS EXPORT

HK260749 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0158 GMT 23 May 86

[Report: "Shanghai Has Become China's Most Powerful Shipbuilding and Ships Export Base"]

[Text] Shanghai, 23 May (Zhongguo Xinwen She)--Some 20 shipyards along Huangpu Jiang in Shanghai constitute China's most powerful shipbuilding and ships export base.

This huge shipbuilding base is turning out a large number of missile escort vessels, antisubmarine excort vessels, and other new-type naval vessels.

During the Sixth 5-Year Plan period, Shanghai built 442 vessels for domestic use and foreign ship merchants, accounting for about half of the total tonnage of the China shipbuilding Industrial Corporation.

In the coming 5 years, China will build six bases for exporting ships, the four major ones of which are the Jiangnan, Zhonghua, Shanghai, and Hudong shipyards. The State Council has approved the expansion of foreign trade authonomy of shipbuilding enterprises in Shanghai.

In recent years, Shanghai has introduced from many countries shipbuilding technology and production managerial methods of advanced international standard. It has bought the patents for the world's most advanced ship diesel engine technology from Switzerland, Denmark, and the FRG as well as the patents for ship generating units and deck machinery from Britain, France, and Japan. Shanghai can now manufcture ships according to the requirements of the main ship classification societies in the world.

Shanghai is now building two ships each with a tonnage of 60,000 and will complete the building of seven ships each with a tonnage of 10,000 this year, the total tonnage being 264,000. Meanwhile, it is starting to build 11 other ships each with a tonnage of 10,000. The variety of ships is undergoing a change from bulk cargo ships to container ships, unmanned cabin bulk cargo ships, multipurpose ships, and tri-puropse working ships.

The "Yuanwang" and "Xiangyanghong No 10" survey ships, both designed and built by the Shanghai Jiangnan shipyard and the China Ships and Uu Engineering and Design Research Institute, have taken part in transporting rockets. In the investigation concerning the launching of synchronous telecommunications satellites, and in surveying the South Pole. In particular, the building of the "Yuanwang" survey ship and its success in fulfilling its tasks have been acclaimed by astronavigation circles in the country and abroad as a milestone in China's astronavigation history. Shanghai is now building for the FRG two new-type ships for transporting cars each with a tonnage of 24,000 and the new-type 64,000-ton bulk cargo ships being built for a Hong Kong compnay has the largest tonnage of any ship ever built by Shanghai.

Lu Shansen, manager of the Shanghi shipbuilding industrial company, said: The international ship market will not remain depressed forever, and Shanghai will make good preparations in various aspects of its shipbuilding industry for the arrival of the emerging period of navigation.

CONSTRUCTION

PRC PORT CONSTRUCTION REVIEWED

HK220939 Hong Kong LIAOWANG (Overseas Edition) in Chinese No 19, 12 May 86 p 21

[Article by Yi Fei [0001 7378]: "China's Port Construction -- Review and Prospects"]

[Text] In recent years, China's ports are often jammed with vessels and shipments delayed. This shows that, on the one hand, China's contacts with other countries are expanding swiftly and, on the other hand, its basic port facilities still far from suit the needs of opening up to the outside world and invigorating the domestic economy. During the fourth session of the sixth NPC conference held recently, Premier Zhao Ziyang reempahsized the importance of communications and transportation, stressing that communications and transportation will still be the focal points of economic development in the "Seventh 5-Year Plan." It is expected that during the "Seventh 5-Year Plan" period, China's port construction will advance by leaps and bounds and the strain on ports will be greatly relieved within 5 years.

According to an analysis made by people of the departments concerned, the changes which have taken place in China's ports over the last 5 years are mainly characterized by the following three aspects:

First, unprecendented growth developed in port construction and production. During the "Sixth 5-Year Plan" period, China built a total of 54 10,000-ton deep-water berths and 25 5,000-ton middle-class berths, adding a loading and unloading capacity of over 100 million tons. On average, 11 deep-water berths were built per year, adding a loading and unloading capacity of 20 million tons. As a result, the total number of deep-water berths in the main coastal ports amounts to 199 and the total number of middle-class berths has reached 156, with the total loading and unloading capacity coming to over 317 million tons. The construction achievements made in these 5 years are nearly as much as the total achievements made in the 10 years from 1970 to 1979. The freight loading and unloading capacity in the main coastal ports overfulfilled the target stipulated in the "Sixth 5-Year Plan" 1 year ahead of time. Freight handled in 1985 amounted to over

350 million tons, an increase of 62 percent over 1980 and showed an annual average growth rate of 10.1 percent. In 1984 and 1985, the transaction capacity of Shanghai port, the largest commercial port in China, topped 100 million tons for the 2n year in succession, thus leaping into the ranks of the world's 100-million-ton ports.

Second, a number of policies and measures were worked out to expedite the development of ports. The principle that both the central and local authorities should promote port construction and that equal importance should be equally attached to large, medium and small ports and the building of new ports and the transforming of old ports was proposed. To expand the source of funds for port construction, the "interim provisions for according preferential treatment to Chinese-foreign joint ventures engaging in port and wharf construction," charging additional port dues to freight in the main coastal ports, and other methods were publicized.

Third, a new tendency by inland provinces and regions to pool funds to build ports has arisen. Over the last 5 years, three wharves have been built by freight owners, jointly built by localities or by foreign capital. In 1985 alone, as many as 32 wharves and berths were built by the material departments of Hubei Province, totaling a loading and unloading capacity of over 2 million tons. In order to jointly exploit and use Lianyun Port, the seven provinces and cities along the Long-Hai railroad set up a special coordination group and signed an agreement to build seven 10,000-ton deep-water berths through consultation, in an effort to open up seaways for these inland provinces and cities.

Prospects for the Coming 5 Years

According to plans by the communications and transportation departments, during the "Seventh 5-Year Plan" period beginning from this year, the coastal ports should complete and commission 100 to 120 deepwater berths and build 80 medium and small berths. The number of deepwater berths will more than double the berths completed and commissioned over the last 5 years. By 1990, the total transaction capacity in coastal ports will amount to 550 million tons, an increase of 67 percent over 1985. In the specific plans for the shipment of bulk cargoes, the following aspects have been listed as focal points:

-- Transportation of energy resources. To coordinate with the efforts to ship the Shansi Province's coal eastwards, four coaling ports linking up with the northern, central and southern railroads will be built in the coastal areas. Besides, 13 coaling ports will be built in each relavent coastal coal-receiving province or region. By 1990, the coastal ports' coal-loading capacity should reach over 100 million tons; their coal-unloading capacity should reach over 80 million tons; and the coal-exporting capacity should reach 20 million tons. Therefore, in addition to the coastal transportation fleets, a complete marine coal transportation system can be formed. As for transportation of crude oil, two new 200,000-ton crude oil berths will be built in Dalian and Qingdao, adding a loading capacity of 29 million tons. By 1990, China will have 11 crude oil loading berths with an annual loading capacity of 90 million tons, which can basically meet the crude oil shipping needs of all major oil fields in China.

-- Containerized transportation. By the end of 1990, the total transaction capacity of China's container berths will reach 1.4 million containers, or 10 million tons. Special berths for shipping timber will amount to 23, with a loading and unloading capacity of over 10 million tons.

-- Grain transportation. Construction of berths for shipping grain in ports like Qinhuangdao, Lianyun Port, Yinkou, Dandong, and so on, will be started or accelerated. Furthermore, priority will be given to the transformation of the Ganjingzi container wharf in Dalian, in an effort to meet the needs of importing and exporting grain.

-- Transhipment. In the coming 5 years, two stages to increase the number of anchorage, pontoon, marine transfer platform, barge, tug, and other facilities will be increased in two stages. This will raise the loading and unloading capacity by 38 million tons. In order to divert freight volume of major ports and promote economic development in coastal areas and transportation between the mainland and islands, about 80 medium and small berths, which can be used in both passenger and freight transportation, will be built in over 20 coastal ports, adding a transaction capacity of about 30 million tons.

If the abovementioned plans can be completed as scheduled, three fundamental changes will take place in China's coastal ports: First, the phenomenon of congestion will be greatly relieved; and by 1990, the number of China's coastal berths will reach about 1,200. Of these, 300 to 320 will be deep-water berths, thus attaining a normal ratio of 1:2 between the number of beths and the number of vessels in port. Second, the water transportation of key materials can be basically handled in ports. For example, the water transportation of bulk materials like coal, crude oil, ores, grain, timbers, and so on, can be generally linked up with the transportation capability of railroads and pipes, thus coordinating the loading and unloading capabilities of both the marine coal and crude oil transportation systems. Third, the degree of modernization in ports will be improved, the structure and layout of ports and the conditions of highway transportation will be greatly improved.

The Primary Works for This Year

Departments responsible for the work in China have required the coastal ports to raise this year's total transaction capacity to more than 340 million tons and make a success of those port construction items which have already been included in state plans. Beginning this year, the investment in underwater projects at ports and berths which have already been incorporated in state plans will be gradually undertaken by the state, while the construction of shore facilities will be completed by every port office and operational unit by soliciting loans or raising funds themselves. This year, the transhipment business will also be expedited. Meanwhile, efforts should be made to firmly grasp the technical transformation in ports. The stress of the technical transformation should be put on energy resources, foreign trade and passenger transportation stations and places, as well as on reconstructing the coastal wharves and berths with backward technology and equipment, expanding stockyards and storehouses, and improving the transportation conditions.

FOREIGN ECONOMIC LEGISLATION REVIEWED

Beijing ZHONGGUO SHEHUI KEXUE (SOCIAL SCIENCES IN CHINA) in Chinese No 5, 10 Sep 85 pp 185-194

[Article by Zhang Xiangyu [1728 5046 1342], responsible editor Lan Yongwei [5663 3057 5588]: "A Preliminary Study of China's Framework of Foreign Investment Laws"]

[Text] The present article affirms the fact that China has built up a framework of foreign investment laws. The article believes them to be composed of two parts: domestic laws and treaty law, both types being under the supreme direction of the constitution. The present article discusses the legislative motives and aims of China's framework of foreign investment laws, analyzes the policy expressed in the framework and presents its own ideas on the administrative levels of China's framework of foreign investment laws.

The author, Zhang Xiangyu, was born in 1957, taught law at Wuhan University's law faculty and obtained a master's degree in law at the Wuhan University. In 1984 he obtained a master's degree from the college of law of the University of Michigan in the United States and is now working toward his doctor's degree at the College of Law of the University of Michigan.

The degree to which a country has perfected its legal system is one of the important indices to measure the quality of its investment environment. Following the 3d Plenum of the CPC Central Committee, the NPC launched systematic legislation of foreign investment laws. The various departments of the central government and of local governments too drew up many laws and regulations relative to foreign investments. In the 5 years from 1979 to 1984, China enacted almost 60 laws and regulations concerning foreign economic relations and foreign investments. (Footnote 1) At the same time, China signed several agreements for the protection of investments and other bilateral agreement related to investments with the numerous countries that were the main investors in China. A fairly complete Chinese system of foreign investment laws has thus been shaped. This system is composed of two parts, the domestic laws and the legal provisions of the treaties, and both components are topped by the principles anchored in China's Constitution. This situation has made it an important task for scholars of jurisprudence to probe into the content, structure and characteristics of this system.

I. Principles of the Constitution

Many Westerners who study the Chinese foreign investment laws seem to believe that there is a conflict between the Chinese investment legislation and the Chinese Constitution. (2) As they see it, there is a deep contradiction between the principle of China's foreign investment laws in acknowledging and protecting foreign investments and the principles of public ownership and planned economy set forth in the constitution. However, these persons have no true understanding of the Chinese Constitution.

The public ownership system of socialism is China's fundamental economic system as set forth in the Chinese Constitution, but it is not the only form of an ownership system in China. In view of the comparative backwardness of China's economy and its desire to quickly bring about a change in this situation and transform China into a modern socialist state, the Chinese Constitution has adopted the following principle in its socioeconomic system: Given the premise of upholding the leading position of the state economy, China must develop diverse economic forms, so as to promote the prosperity of the entire national economy.

Planned economy is the fundamental characteristic of the socialist public ownership economy, as it is also one of the fundamental principles fixed in the Chinese Constitution. However, at the same time as China's Constitution affirms that "the state will implement planned economy on the foundation of the socialist system of public ownership," it also affirms the role of market regulation. (Article 15) There is absolutely no contradiction between the implementation of planned economy and the use of the law of value and the development of a commodity economy. In summary one may say that China practices a planned commodity economy. China's Constitution also prescribes: "State enterprises shall have decision-making power in operation and management within the limits prescribed by law, on the condition that they submit to the unified leadership of the state and fulfill all their obligations under the state plan," (Article 16) and that "collective economic organizations shall have decision-making power in conducting independent economic activities, on condition that they accept the guidance of the state plan and abide by the relevant laws." (Article 17) The economic principles of China's Constitution are not at all mechanical and rigid, but have a large measure of elasticity and diversity. (4)

The sense of principle and the flexibility of the Chinese Constitution provide strong legal support for wide-ranging attraction of foreign capital and for the establishment of new economic forms, such as the joint venture enterprises. There are, furthermore, specific articles in China's Constitution that express the principle of attracting foreign capital and protecting foreign investments. Article 18 of the Chinese Constitution prescribes: The PRC allows foreign enterprises, other economic organization and individuals to invest in China and to engage in economic cooperation of various forms with Chinese enterprises or other economic organizations in accordance with the provisions of Chinese law. On Chinese territory, foreign enterprises and other economic organizations as well as Chinese-foreign joint venture enterprises must abide by the laws of the PRC. Their lawful rights and interests receive the protection of the laws of the PRC.

The Chinese Constitution is the legal basis for all of the country's territorial laws and various individual laws and regulations. The constitutional principle of affirming and protecting foreign investments provides a feasible legal foundation for the establishment of China's entire system of foreign investment laws. During the entire process of China's foreign investment legislation, whether in the formulation of individual domestic laws or the signing of bilateral international treaties on investments, the principles of the constitution regarding adherence to the socialist economic system and the treatment of foreign investments have all along been the directives of highest authority.

II. Principles, Policies and Objectives of China's Foreign Investment Legislation

The principles set forth in the constitution are highest authority for China's foreign investment legislation, but any individual independent legal system will also want to give expression to its own principles, policies and objectives. The primary principle of China's foreign investment legislation is the principle of sovereignty.

Sovereignty is the key factor that allows us to measure the success or failure of a country's foreign investment legislation. In old China, the policy of the reactionary governments was one of selling out the country's sovereign rights. As a consequence, foreign capital monopolized China's national economy, subdued its national industry and commerce, impeded their development, and had China, finally, decline into the state of a semifeudal, semicolonial country. In their states of economic backwardness, certain Third World countries have had the same experience of merely seeking eagerly to import foreign capital while disregarding the need to emphasize the principle of sovereignty in their relevant legislation, with the result that foreign capital monopolized the lifelines of the national economy and even threatened the political independence of the countries in question. China is an independent socialist country. While China intends to import foreign capital and advanced technologies on a broad scale, it must at the same time draw lessons from Chinese and foreign historical experiences and firmly uphold the principle of sovereignty.

The principle of sovereignty is nothing abstract, but is a legislative principle with abundant meaning. Its basic demand is that no foreign investment must harm the totality of our country's sovereignty. (5) By implementing the principle of sovereignty in our foreign investment legislation, we can ensure the state's control, supervision and proper management of foreign capital. For instance, by its legislation, the state can restrict foreign capital from infiltrating vital sectors of the country's economy, such as the war industry. Through the establishment of a legal procedure of examination and approval of foreign investments, the state can maintain effective controlling powers over foreign capital. The principle of sovereignty in foreign investment legislation is also evident in the legal demand that foreign investments must not destroy China's ecological equilibrium or pollute the environment, and also not violate China's socialist ethics. (6)

Another important principle incorporated in China's investment legislation is the principle of equality and mutual benefit. The principle of equality and mutual benefit is an important principle that China has consistently advocated and faithfully pursued in its foreign economic relations. This principle is also recognized by most countries and in certain important documents of international law. (7) It is one of the major principles that guide modern international economic intercourse. In past international economic relations, the capital-exporting countries hoped to be able to use their capital exports to exploit and plunder the capital-importing countries. Frequently, such capital-exports resulted in the capital-exporting countries getting richer and richer and the capital-importing countries getting poorer and poorer. During the period from the 1960s to the early 1970s, many Third World countries launched movements for the establishment of a new international economic order, with the aim of changing the economic imbalance in the world brought about by the exports of capital, and to establish the principle of equality and mutual benefit as the major legal basis for the world's new economic order.

The core of the principle of equality and mutual benefit is its "mutuality." In their economic-legal meaning, equality and mutual benefits are two inseparably linked concepts. In the course of international economic activities, there can be true equality only if there is also mutual benefit, and there can be real mutual benefit only if there is true equality. China is a big country abounding in natural wealth, it has abundant natural resources, a huge market potential and relatively cheap manpower, but China's economy is comparatively backward and in need of large imports of foreign capital and advanced technologies. This is the actual foundation on which China practices the principle of mutual benefit in its investment policy. China's foreign investment laws, therefore, persistently emphasize not only in China's treaty law sector, but also in the sector of its domestic laws, the importance of conducting investment activities on the basis of equality. For the most favorable implementation of the principle of equality and mutual benefit, China's foreign investment laws obviously tend to favor the forms of joint ventures for the importation of capital, since by using this form, it is possible to achieve a closer integration of the interests of the two parties, the Chinese and the foreign investors, on the basis of equality.

Law is the manifestation of policy. China's current foreign investment legislation abundantly manifests an important policy; this is the policy of the state of currently encouraging foreign investments. Because China had in the past overemphasized the principle of reconstruction through its own strength, no experiences were gathered in the field of importing capital, and many foreign investors, for this reason, maintained scepticism as to investments in China. On the other hand, China's four modernizations urgently need foreign capital and advanced technologies. This fact determined for China that it is necessary at the present stage to adopt a policy of encouraging foreign investments. China's foreign investment laws have played an important role in this respect. The policy of encouraging foreign investments in China's foreign investment laws is not limited to one or two slogans, but is incorporated in a large number of substantive legal provisions. First, the treaties concluded by China with various countries regarding investments generally include such favorable clauses as the most-favored-nation clause, clauses against uncompensated expropriations or nationalization and clauses for the transfer of profits . (8) Second, in domestic legislation, China has instituted the system of special economic zones [SEZs]. A variety of favorable investment conditions apply to these SEZs, creating a unique investment environment for foreign investors. Third, China's foreign investment laws, furthermore, encourage foreign investments by policies of low taxation and of exemptions from income tax for the initial periods of investments. For a more effective attraction of advanced technology imports from abroad and to encourage foreign investments in China's remote border regions or in China's relatively weak economic sectors, China's foreign investment laws provide a great variety of favorable provisions at different localities.

The objective of China's foreign investment legislation is simply to provide protection by legal means for foreign investors, for foreign investments and for foreign investment profits, on the condition of upholding China's national sovereignty and national interests. The most basic objective of China's foreign investment legislation is to establish a perfect legal system to facilitate importation on a broad scale of foreign capital, foreign advanced technologies and advanced managerial experiences, and thereby promote China's economic development, raise the level of China's science, technology and business management and speed up realization of China's four modernizations. A complete system of foreign investment laws will also promote China's economic cooperation and technology exchanges with other countries, thereby giving added impetus to the economic, scientific and technological development throughout the entire world.

III. Domestic Legislation

(1) Development of Domestic Legislation

The Law of the PRC on Joint Ventures Using Chinese and Foreign Investment, adopted by the Second Session of the Fifth NPC on 1 July 1979 (hereafter called the "Chinese-Foreign Joint Venture Law"), signifies the beginning of China's foreign investment legislation. The promulgation of this law evoked strong responses in China as well as abroad. While praising China's foreign investment legislation, many foreign scholars at the same time expressed disappointment with the law itself. In their opinion, it was an imperfect and imprecise law. (9) However, these persons did not completely understand China's legislative intention and guiding ideology.

The Chinese-Foreign Joint Venture Law provided fundamental guiding principles for the establishment of China's system of foreign investment laws. Even though it consisted of only 15 simple articles, each article had important legal significance. Since the 3d Plenum of the 11th CPC Central Committee had decided on an open-door economic policy, and since China's four modernizations were in urgent need of large amounts of foreign capital and advanced technologies, and since, furthermore, foreign investment legislation was an as yet untried matter with very little experiences available at that time, these factors determined that our first foreign investment legislation could not go into detail, but could merely provide fundamental principles. Even though this law does not go into great detail, it is comprehensive. The said law contains provisions of a principle nature as to the principles and objectives of China's importation of foreign capital, the legal status, management and capital investment ratios of joint ventures, the scope of their operations, taxation, profits and foreign exchange as well as on the contracts themselves and the settlement of disputes. It is in this form that it became the basis for later Chinese foreign investment legislation. When it was enacted, the significance of the Chinese-Foreign Joint Venture Law far exceeded the mere articles of its text, since it indicated China's resolve to use the legal system in support of its importation of foreign capital and to protect foreign capital investments. It signified, therefore, that China will enact in future many more foreign investment laws and even build up a perfect system of foreign investment laws. (10)

One year later, in July 1980, based on the principles of the Chinese-Foreign Joint Venture Law and a year's experiences in the work of importing foreign capital, the State Council promulgated the PRC Regulations on the Registration of Chinese-Foreign Joint Ventures and the PRC Regulations on Labor Management in Chinese-Foreign Joint Ventures. The former is a detailed elaboration of Article 3 of the Chinese-Foreign Joint Venture Law and fixes in law the procedure for the registration of Chinese-foreign joint ventures. The latter regulation was drawn up based on the principles of Article 6, Paragraph 2 and Article 4 of the Chinese-Foreign Joint Venture Law and solves all legal questions in connection with labor contracts by the Chinese-foreign joint ventures. In September of the same year, the Third Session of the Fifth NPC promulgated two tax laws: The Income Tax Law of the PRC Concerning Chinese-Foreign Joint Ventures and the Individual Income Tax Law of the PRC. At its Fourth Session in December of 1981, the Fifth NPC adopted yet another important tax law concerning foreign capital: the Income Tax Law of the PRC Concerning Foreign Enterprises. These three income tax laws express the various policies adopted by China regarding taxation of foreign investments. Based on the principles of these three laws, the Chinese Ministry of Finance drew up as a further step three corresponding law enforcement regulations, which were approved and promulgated by the State Council. In this manner, China achieved a comparatively complete system of tax laws. Out of consideration for specific investment objectives, the State Council at the same time drew up the Regulations of the PRC on Cooperation With Foreign Parties in the Exploitation of Offshore Oil Resources, and out of consideration for peculiarities of the investment territory, the Standing Committee of the NPC approved the Regulations of the PRC on Special Economic Zones in Guangdong Province. China also issued regulations on the control of resident representatives of foreign enterprises and drew up legal provisions on the control of foreign exchange remittances by foreign organizations and individuals. Furthermore, following the increasing opening up of the country and importation of foreign capital, China in recent years actively improved its relevant maritime customs laws and other legal systems having a bearing on foreign investments.

On 20 September 1983, the State Council promulgated the Enforcement Regulations to the Law of the PRC on Joint Ventures Using Chinese and Foreign Capital (hereafter the "Chinese-Foreign Joint Venture Enforcement Regulations"). This signified the basic completion of China's framework of foreign investment laws. This law has 16 chapters and 118 articles, and as it is based on more than 4 years of experiences in the work of importing foreign capital, it greatly enriched and elaborated in detail the principles expressed in the Chinese-Foreign Joint Venture Law of 1979. China's foreign investment law is no longer a set of abstract legal principles, but a comprehensive system of specific legal norms of more than 1,000 articles.

(2) The Structure and Special Characteristics of Domestic Legislation

China has been comparatively late in starting to import foreign capital. When China began to legislate on foreign investments, many countries of the world had already established perfect legal systems on foreign investments. China's legislation on foreign investments not only widely referred to the achievements of other countries in this line of legislation, but also summed up the practical experiences gained in the concrete conditions of China. China's system of foreign investment laws, therefore, displays a unique national structure and distinctive national traits.

In its overall aspect, China's domestic legislation on foreign investments shows three structural levels. The three different levels are linked with one another, exercise an impact on one another and thus form a comprehensive domestic legal system. The three structural levels of domestic legislation on foreign investments are: 1. Local laws and regulations; 2. The legal norms and enforcement regulations drawn up by the departments of the central authority and by the State Council; 3. The various individual laws passed by the NPC. In the following we shall discuss the substance and relations of these three structural levels:

The local laws and regulations mentioned as the first administrative level refer to laws and regulations issued by China's local governments. Article 100 of the Chinese Constitution prescribes: "The people's assemblies of provinces and directly administered municipalities, as well as their standing committees, may enact laws and regulations of a local nature, provided they do not conflict with the constitution, laws and administrative regulations; such local enactments shall be reported to the Standing Committee of the NPC for the record." Since the initiation of the open-door policy, several local governments enacted certain laws and regulations of local nature or of special nature based on the actual conditions of the locality concerned, in order to further broaden the importation of foreign capital. The most conspicuous of these are the Regulations on Special Economic Zones in Guangdong Province, passed by the Guangdong Provincial People's Assembly and approved by the Standing Committee of the NPC on 26 August 1980. These regulations were drawn up in consideration of the coastal location of Guangdong Province and its special geographical environment, namely the proximity to Hong Kong and Macao. The law delineates a certain area as an SEZ and, furthermore, provides for this area more favorable treatment for investors than at other places, in order to attract larger amounts of foreign capital. After establishment of the SEZ, it became necessary to establish a series of laws and regulations pertaining to the said SEZ, such as the Provisional Regulations on Labor Management in the SEZ, provisional Regulations on Land Management in the SEZ, etc. The laws of this organizational level have the following obvious characteristics: one, they are of local nature, and two, they are of a particular nature. Laws of this type generally apply only within a certain territory and will provide improved protection and more favorable treatment for foreign investments. In May of 1984, the CPC Central Committee and the State Council decided to open up a further 14 coastal ports, based on the successful experiences of the operation of SEZs in China, in order to attract more foreign capital and import more advanced technologies. There will, therefore, in future be a gradual increase in foreign investment laws of this structural level.

On the second administrative level, there are the legal norms and enforcement regulations drawn up by departments of the central authority and the State Council. The number of these regulations is very large, and they are, furthermore, regulations with fairly specific formulations, and therefore, there are many opportunities to apply them. For instance, the Enforcement Regulations to the Chinese-Foreign Joint Enterprise Law promulgated by the State Council, the three enforcement regulations to the foreign investment income tax laws drawn up by the Ministry of Finance and approved by the State Council, the Provisional Regulations Governing State Control of Foreign Exchange passed by the State Council on December of 1980, as well as the corresponding two enforcement regulations promulgated by the State General Administration of Exchange Control, the Regulations of the PRC on Foreign Cooperation in the Exploitation of Offshore Oil Resources adopted by the State Council in January 1982, all these belong to this administrative level. The laws of this administrative level constitute the principal part of domestic legislation on foreign investments. The special characteristics of this legislation are that it touches on a large spectrum of questions regarding foreign investments and that it, furthermore, provides clear, specific and substantive legal provisions.

The third administrative level tops the second level and is constituted by various individual laws and regulations on foreign investment promulgated by the NPC, for instance, the three income tax laws regarding foreign capital and the Foreign Economic Contract Law, promulgated by the NPC, as well as the Foreign Enterprise Law, Company Law and Law on Cooperatively Managed Enterprises, on which drafting and deliberating is now being speeded up. The most significant law of this structural level is the Law on Chinese-Foreign Joint Ventures, promulgated in July of 1979. This law provided the important guiding principle for the legislative work on the other two structural levels. The laws of the third administrative level are characterized by the general scope of their application and by their guidance nature; they are the base for the legislation of the other two levels. The third level is, therefore, the foundation for the entire Chinese domestic legislation on foreign investments.

The three levels in China's domestic system of foreign investment laws can be differentiated according to the following three criteria: first, the difference of legislative organizations, differentiating here by local governments, central government and the NPC; second, differentiating according to the different scope of application of the laws, that is, whether the laws are of local nature or of nationwide nature; third, the difference in the significance of the laws, differentiating here those of specific applications and those of guidance character. The occurrence of the three levels is linked with China's political structure and the actual demands for the absorption of foreign capital. Each legal level plays its particular important role, but all together form a harmonious union and for this reason constitue a comparatively perfect system of Chinese domestic legislation on foreign investments.

IV. Treaty Law

We can roughly divide China's treaty law on foreign investments into three groups: one, China's agreements with foreign countries for mutual promotion and protection of investments; two, China's agreements with foreign countries regarding taxation; three, other agreements signed between China and other countries with some bearing on foreign investments. These three types of treaty law are also mutually linked; they constitute another important component of China's system of foreign investment law.

(1) Agreements Mutually Promoting and Protecting Investments

In international practice, the conclusion of treaties for the mutual promotion and protection of investments has had only a short history of more or less 25 years, but is now a general practice throughout the world. (11) Especially since 1967 when the UN Economic Cooperation and Development Organization drew up standard agreements for the mutual promotion and protection of investments, more countries were willing to provide investment protection through treaties. Since China instituted the open-door policy and speeded up legislation on foreign investments, China, too, actively negotiated and signed treaties with those countries which were the main investors for a series of investment protection treaties. Up to November 1984, China signed this type of agreement with Sweden, Romania, the FRG, Belgium, France, Canada, the Soviet Union, and Norway. (12)

Actually, China's first agreement involving protection of investments was signed with the government of the United States on 7 October 1980: the Agreement on Investment Insurance and Investment Gurantees as Encouragement to Investments, effective with the exchange of notes on 30 October. By this agreement, China undertakes to protect all American investments in China that have had the approval of the Chinese Government and, furthermore, regulates the remittance of profits from American investments, the settlement of disputes, and other such questions. However, this investment agreement has a special feature, not found in the general investment protection agreements, in that its main purpose is to allow the American Overseas Private Investment Corporation (OPIC) to provide investment insurance and investment guarantees for projects or activities carried out or participated in by America with the approval of the Chinese government, as an encouragement for more private American investments in China. Since this was the first foreign investment agreement concluded by China, it provided China with experiences for future foreign investment treaties and laid the foundation for the Chinese-American investment protection agreement which is now under negotiation.

The agreements signed by China with other countries on the promotion and mutual protection of investments are not much different from this type of agreement now internationally in common practice. They generally contain the following provisions: 1. Definitions; 2. Treatment of investments; 3.

Transfer of gains from investments; 4. Methods of settling disputes. In the following, I shall take the Chinese investment protection agreement with the FRG as example, (13) to demonstrate in detail the various aspects of such an agreement. In defining the term "investment," the agreement refers to all lawful property, which includes property rights to movable and immovable property and other rights over things, and also includes company shares, monetary claims convertible into economic values or rights to demand actions of economic value, copyrights, industrial property, trademarks, and every kind of patent right. In defining the term "investor," the agreement generally refers to juristic and natural persons of the nationality of the contracting countries. The agreement defines the term "gains" as the profits, dividends, interests or other lawful income accruing during a certain period of time. Articles 2, 3, 4 and 8 deal with the treatment of investments, the basic principle being that each contracting country must under all circumstances afford equitable and rational treatment to the investments within its territory by the other signatory country. (Article 2) The agrement also contains the most-favored-nation clause. Article 4 contains provisions on compensation in case of nationalization and regarding foreign investments incurring losses due to one country being involved in war or declaring a state of emergency. The third aspect, the transfer of gains and remittances, is dealt with in Articles 5, 6 and 7, where the foreign investor is given a comparatively large measure of freedom. Finally, there are provisions for the settlement of disputes. The said agreement provides that in case of a dispute, the contracting countries should as far as possible arrive at a negotiated settlement. If settlement is not achieved within 6 months, each of the contracting countries can demand arbitration. The agreement contains clear and definite provisions on the constitution of the arbitration tribunal, on the effect of the arbitration award and on the responsibility for the arbitration expenses.

In studying these investment protection treaties signed between China and other countries, there is one question that deserves our special attention, namely the "reciprocity" of these treaties. At the present stage, China is still a capital-importing country, and China's investments abroad are only of a very limited amount compared with foreign investments in China. However, in all investment protection treaties the protection provided to foreign investments must be reciprocal, meaning that each contracting party must provide reciprocal protection to investments in its territory by the other party. It is for this reason that treaties of this kind signed by China are generally called "agreements for the promotion and mutual protection of investments." They apply not only to investments in China by the other contracting country, but also to Chinese investments in the territories of the other contracting countries. However, while emphasizing the principle of reciprocity, more importances attaches to the protective role of these investment protection agreements for all foreign investments on Chinese territory, since China is presently in the position of a capital-importing country.

(2) Agreements on Taxation and Other Agreements Involving Foreign Investments

The question of taxation is a very important question in the Western economic system. It has a direct bearing on the profits gained by anyone engaged in any kind of economic activity. Legal provisions on taxation are, therefore, a matter of greatest concern to those either operating or employed in business operations. There are now a large number of investment projects, Chinese-foreign joint ventures and foreign employees in China, and since 1980 China has gradually built up a tax law system concerning foreign investments. However, since the foreign enterprises, branches of foreign enterprises and foreign individuals working in China are also subject to the laws of their own countries, conflicts may arise between the Chinese and the foreign tax laws. These may result in two irrational situations, one being double taxation, i.e. being taxed by Chinese as well as by the relevant foreign tax law. The other is tax evasion, i.e. a certain investment or person should be taxed, but evades taxation because of the foreign element in the legal facts. This kind of conflict of laws can generally be solved in two ways: one is to select one law according to the rules of conflict of law in one country, i.e. to regulate these cases according to the methods of private international law; the other method is to conclude treaties and regulate these cases by one uniform standard. The second method has many advantages over the first method. It is easier to apply, easier for the parties to understand and manage, and, what is even more important, it can bring about a comparatively more thorough solution to questions of conflict of law and, furthermore, achieve uniform results. It has therefore become general international practice to solve conflicts of tax laws related to foreign investments by bilateral treaties.

China has concluded agreements for the prevention of double taxation, tax fraud and tax evasion with Japan, the United States, Great Britain, France and other countries. Since tax laws are complex, different rules apply to different situations, and since many technical questions become involved, the texts of these treaties are in general also very complex.

Agreements for the prevention of double taxation, tax fraud and tax evasion are important supplements to China's domestic tax legislation, as they also form an important component of China's treaty law concerning foreign investments. Not only do they ensure application of Chinese domestic tax legislation to foreign investments and foreign personnel, but also round out China's treaty law. Because the tax problem is an important problem of direct concern to foreign investors, and since double taxation is what foreign investors are most concerned about, the way China resolved the problem in a rational manner by concluding treaties that protect the lawful interests of the foreign investors will also reasure their confidence in investments and encourage many more foreign investors to invest in China.

The Chinese government has concluded many other agreements that have a bearing on foreign investments. These agreements do not deal entirely with foreign investments, but their subject matter has a direct or indirect bearing on foreign investments, or certain of their articles directly or indirectly have a bearing on foreign investments. There is a large number of such agreements, including many trade agreements signed by the Chinese Government with foreign countries, as well as agreements for economic cooperation, agreements for the transfer of technologies, etc. For instance, the China-United States Industrial and Technological Cooperation Agreement, signed in Washington on 12 January 1984, is of this nature. Article 3 of this agreement specifically provides for broad industrial and technological cooperation between the contracting countries, including cooperation in production and manufacture. Even though this agreement has no direct bearing on foreign investments, the role of these agreements in China's foreign investment law must not be ignored. Especially in relation to those countries with whom China has up to now not yet officially concluded foreign investment protection agreements, the agreements that have been concluded become legal documents for the adjustment of mutual relations between China and those countries.

V. Short Summary

Foreigners have called China a country without law; we had the same idea during the "decade of turmoil." The impression that no legal system exists or that the legal system is imperfect is one of the most serious mental encumbrances of foreign investors regarding investments in China. However, since 1979, in the short period of only 5 years, China has established a comparatively perfect system of foreign investment laws.

The way a socialist country treats its foreign investors is not merely a theoretical question, but a highly important question of legislative reality. China has had no foreign experiences it could immediately copy, (14) but had to probe and explore its own way in actual practice. The Chinese Constitution on the one hand emphasizes the principle of socialist public ownership economy and on the other hand affirms the special characteristic of a diversity of socialist economic forms, and it has also incorporated the principle of protecting foreign investments in its text. The Chinese system of foreign investment laws is, therfore, a component of China's socialist legal system; it is well coordinated with all other Chinese domestic laws into one unified entity.

China's foreign investment legislation has its own distinctive legislative principles and objectives. It emphasizes upholding sovereignty and national interests in the process of importing foreign capital, while at the same time actively encouraging foreign investments by granting various favorable conditions. The principle of equality and mutual benefit is one of the five principles of peaceful coexistence advocated by China, as it is also one of the important principles of modern international economic law. It is a principle that China has all along pursued in its foreign economic relations and trade activities. It has found faithful implementation in China's foreign investment legislation. Because China's foreign investment legislation is manifesting China's policy of promoting and encouraging foreign investments during China's present stage, this legislation has played an important role in the expanded importation of foreign capital, and in the acceleration of China's economic construction and scientific and technological development. It, furthermore, promoted and protected China's economic cooperation and technological exchanges with other nations, and thus enriched the world economy.

China's system of foreign investment laws also shows distinctive levels and a rational structure. The domestic portion incorporates legislation in the nature of principles as well as legislation on particular details. It contains norms of local applicability as well as norms of nationwide applicability. Its treaty law part lays stress on upholding our national interests, but at the same time gives consideration to the protection of the interests of the foreign investors, and, furthermore, resolves certain problems of specific legal applicability as regards investments. The two large groups are then also harmoniously combined into one by China's Constitution, thereby achieving the nature of a unison and complete system.

Even though China's system of foreign investment laws is a fairly complete system, it still is a system in the course of being built up. A truly perfect foreign investment law of a country comprises not only parts that apply to imported foreign investments operating on its own territory, but also sections that would apply to the investments by its own state, juristic persons and citizens outside of its own territory. We feel justified in affirming that in the wake of China's economic development, China will in future establish legal provisions for China's investments abroad and render China's system of foreign investment laws even more perfect.

FOREIGN TRADE AND INVESTMENTS

PARTS OF FOREIGN ECONOMIC CONTRACT LAW TEXT EXPLAINED

Beijing GUOJI MAOYI [INTERTRADE] in Chinese No 8, 27 Aug 85 pp 31-35

[Article by Feng Datong [7458 1129 0681]: "Foreign Economic Contract Law--Eighth Lecture on International Economic Relations and Trade Laws"]

[Text] The Foreign Economic Contract Law of the PRC [FECL] was adopted at the Tenth Session of the Standing Committee of the Sixth NPC and entered into force on 1 July 1985. The said law was to meet the needs of China's opening up to the outside world. It bases on the fundamental principles which China applies to its foreign economic and trade relations and was formulated on the foundation of the sum total of China's actual experiences in handling foreign economic contracts since the founding of the PRC, as well as with reference to international practices and international customs. It is an extremely important piece of Chinese legislation concerning economic contractual relations with foreign parties. The law has 17 chapters on the subjects: formation of contract, performance of contract, liability for breach of contract, assignment, modification, cancellation and termination of contract and the settlement of disputes. The law has 43 articles. I shall introduce in the following certain main parts of the law:

I. General Provisions

In its general provisions, the FECL mainly describes the legislative purpose of the law, its scope, fundamental principles and questions of its applicability, as will be stated in more detail in the following:

(1) The Legislative Purpose

Article 1 of the FECL makes purpose and main theme clear right at the start by stating that the purpose of the law is to protect the lawful rights and interests of parties to economic contracts and to promote the development of China's foreign economic relations. The term "parties to economic contracts" refers here not only to the Chinese parties, but comprises foreign parties as well; the law treats Chinese and foreign parties absolutely equal without discrimination, and protects their lawful rights and interests in the same way. Only in this manner will it be possible to achieve its aim of promoting the development of China's foreign economic and trade relations.

(2) The Scope of the Law

According to Article 2 of the FECL, the law applies to all economic contracts concluded between Chinese enterprises and economic organizations on the one side and foreign enterprises, other economic organizations and individuals on the other side, with the exception of international transport contracts. This provision is evidence of the broad scope of the law's application. Within the scope of the law are, for instance, all contracts of joint ventures using Chinese and foreign capital, contracts of Chinese-foreign cooperative management enterprises, Chinese-foreign contracts for the joint exploration and development of natural resources, import-export trade contracts, contracts for the transfer of foreign technologies, compensation trade contracts, contracts for the processing or assembly of imported materials, international leasing contracts, etc. The provisions of the FECL will apply to a contract if the parties to the above-mentioned contracts stipulate in their contracts that Chinese law shall apply, or if Chinese law requires that certain categories of contracts must be governed by Chinese law, or if a law court or arbitration organization determines that Chinese law has to apply. The only exceptions are the international transport contracts, and the reason for that is possibly that these contracts concern the different ways of transportation, by sea, air or land, where special conditions prevail, which require the enactment of more specific regulations, such as a maritime trade law, air transportation law, railway transportation law, etc. Furthermore, international transport trade must be conducted according to pertinent international conventions; these types of contracts are, therefore, not placed within the scope of the FECL.

(3) Fundamental Principles

In its foreign trade relations, China has all along firmly upheld a policy of independence and self-determination and observed the principle of equality and mutual benefit, and also has give due attention to international practices and customs. These policies and principles are also the fundamental principles of the FECL. The said law, for instance, prescribes: "Contracts must observe the laws of the PRC and must not harm the social and public interests of the PRC." "Contracts must be concluded in conformity with the principles of equality and mutual benefit and of achieving unanimity through negotiations." The law also prescribes that in cases where no provisions exist in the laws of the PRC, international practice may apply. All these provisions are concrete manifestations of the above-mentioned principles. These principles are not only the substance of the general provisions, but permeate the entire law from beginning to end.

(4) Applicability of the Law

Since foreign economic contracts are contracts concluded between Chinese and foreign parties, at least one party is a foreign enterprise or foreign individual. Should a dispute occur, the question of the applicability of the law frequently arises, i.e. the question of which national law should be applied in the resolution of the dispute. Since there are differences in the different national laws, the resolution of a problem can possibly lead to different results, depending on which national law is applied to the case.

The parties, especially the foreign parties, will therefore attach great importance to the question of the applicability of law. On this point, the FECL contains the following provisions:

1. The parties to the contract may choose the law to be applied to the settlement of disputes arising from the contract. This is the fundamental principle. Most countries allow the parties to freely choose the law that should apply to their contracts. It may, furthermore, be explicitly stipulated in the contract, as for instance, that Chinese law, or Japanese law, or English law, etc., shall apply to the contract. This is called a choice of law clause. The main purpose of including this clause in the contract is to provide legal certainty and avoid the event that at a later date in case of dispute different results may be arrived at by the application of different national laws.

Although most countries now allow the parties the freedom to choose the law applicable to their contracts, most also impose some limitations on this choice. For instance, many countries demand that the law of choice must have a real connection to the contract, that the choice must be in good faith and a lawful one, must not violate the public order of the country where the law court is located, and must not evade laws of compulsory nature of the country genuinely related to the contract. Though there are no specific provisions on this point in Chinese law, Article 9 of the FECL clearly prescribes that contracts that violate the law or the public interests of society of the PRC are invalid. According to this provision, the law chosen by the parties must not violate Chinese laws or the public interests of Chinese society.

2. If the parties have not made any choice of a law to be applied to their contract, the law of the country which has the closest relation with the contract shall be applied. According to the procedure generally adopted internationally, if the parties have not explicitly stated in the contract which law is to apply, and a dispute arises, the law court or arbitration organization that is to deal with the case must decide what law to apply according to the conflict of law rules at their location or according to the conflict of law rules they consider must be applied. In conditions of this nature, it is generally suggested to apply the laws of the country that is related closest to the contract. The law of the closest relation can mean the law where the contract was signed, where the contract is to be fulfilled, where the property in dispute is located, where the place of business of the parties is located or where the arbitration organization or law court is located on which the parties have agreed. To make the specific choice among these is up to the law court or arbitration organization to which the dispute is brought; the decision should consider the nature of the contract, the text of the contract and the specific conditions of the dispute.

3. Contracts of joint ventures using Chinese and foreign capital, contracts of Chinese-foreign cooperative management enterprises, contracts for joint Chinese-foreign exploration or development of natural resources, if performance is to take place within the territory of the PRC, must be governed by Chinese law. This is a special rule, the idea being that the mentioned three types of contracts must apply Chinese law, without allowing the parties a choice of any other law. However, this rule must be applied only to the

three mentioned contracts themselves, and must not be extended to include economic contracts that the above-mentioned enterprises conclude with foreign enterprises. For instance, when the Chinese and foreign party conclude a joint venture contract, that contract itself must be governed by Chinese law, and foreign law cannot be applied to it. However, the joint venture enterprise set up according to this contract is a Chinese juristic person, and if it should conclude contracts with foreign companies or enterprises, such as for the purchase or sale of merchandise, the two parties to these contracts are free to choose the laws that should apply to these contracts.

4. If there are no relevant provisions in the laws of the PRC, international practice may apply. This provision, on the one hand, fills gaps where such exist in current Chinese economic legislation, and, on the other hand, establishes closer coordination between the Chinese practice of dealing with foreign economic relations and international practices and customs.

Article 6 of the FECL, furthermore, prescribes that when an international treaty which the PRC has concluded or is participating in relates to a contract and has provisions that differ from the law of the PRC, the provisions of the said treaty shall be applied, but with the exception of clauses to which the PRC has declared its reservation. The purpose of this provision is to acknowledge in legal form the priority of treaty provisions, thus establishing an even better interrelation between Chinese law and international treaties. This plays an extremely important role in the development of China's foreign trade relations.

II. Conclusion of Contract

Chapter 2 of the FECL contains clear and definite provisions on the conclusion of contracts; the main substance of the chapter is the following:

(1) Basic Conditions for the Formation of Contracts

Article 7 of the FECL prescribes: "A contract is formed when the clauses of contract are agreed in writing and signed by the parties." This provision sets two conditions for the formation of a contract:

1. Substantial Condition

The contract can only come about if both parties arrive at an agreement on all contract clauses. This is a basic condition that must be fulfilled by every contract. If the parties cannot arrive at an agreement on all clauses of the contract, no contract can be concluded. Concluding a contract is a legal act by the two parties, brought about by the two legal acts of an offer and an acceptance. If the offer by one party is unconditionally accepted by the other party, this can be counted as having reached agreement and the contract has been accomplished. Legal rules regarding the offer and the acceptance are in most countries contained in their civil law or contract law. China has no civil law yet, nor does the FECL contain any specific provisions in that respect. However, all Chinese foreign trade corporations have established a set of customary procedures in their foreign trade operations, to which reference may be made. The Chinese foreign trade corporations call the offer a "fa pan" or "fa jia" [opening bid], and distinguish a substantial and a hollow opening bid, the main difference between the two being the difference in binding force for the bidder. The substantial opening bid is of binding force for the bidder; the bidder cannot withdraw or amend the bid at will during the period specified in the bid. If the other party unconditionally agrees to or accepts the substantial bid within the set time limit, the contract is concluded, without the need for any further confirmation by the bidder. The substantial bid must fulfill the following two conditions: (1) It must set forth, completely, clearly and definitely, the conditions of the transaction, and (2) it must set a time limit. The hollow bid is an offer made with certain reservations; is has no binding force for the bidder, who may at will withdraw or amend the bid. Even if the recipient of the hollow bid signifies acceptance, a contract will only come about after the final acknowledgment by the bidder. Hollow bids are usually accompanied by such phrases as "subject to my final acknowledgment," or "subject to merchandise still remaining unsold," etc., and will also not set a time limit.

Acceptance is the act by which the contract clauses of the offer are accepted. As soon as the offer is accepted, the contract is concluded. According to the customary practice of China's foreign trade corporations, the acceptance must fulfill the following two conditions: (1) The acceptance is only effective if the communication of it reaches the bidder within the specified time limit, and (2) the acceptance must unconditionally accept all clauses of the proposed contract. Any acceptance beyond the time limit or an acceptance with conditions attached will in principle not be considered as effective acceptances, but must be regarded as a new offer or counteroffer by the recipient of the original offer.

2. Formal Condition

According to the provisions of the FECL, a foreign economic contract must be made out in written form. The reason for this is that a foreign economic contract is a comparatively important contract of a rather complex nature, generally involving large amounts of money. It is therefore necessary to insist on the written form as a token of the seriousness of the transaction. Should a dispute arise, there will then be evidence in writing to facilitate proof. In the opposite case, if contracts are concluded verbally, and a dispute arises, frequently no reliance would be placed on the mere verbal statements, and there would be great difficulty proving the facts of the case.

(2) Regarding Agreements by Correspondence, Telegrams or Telex

Article 7 of the FECL also stipulates: "When an agreement is reached by correspondence, telegram or telex and one party requests a written confirmation, the contract is only concluded with the signing of the written confirmation." It would follow from this provision that if the parties do not request a written confirmation in the case of an agreement by correspondence, telegram or telex, the contract is concluded as soon as the parties have reached agreement, i.e. as soon as the letter, telegram or telex containing the acceptance has become effective. However, this rule applies only to agreements reached by correspondence, telegram or telex. Among trade circles this form of concluding contracts is called transaction by letter or telegram.

In international trade parties mostly negotiate and conclude agreements through this form of transactions by letter or telegram, and it is unlikely that most will request written contracts or confirmations. The said provision of the FECL is therefore in line with international practices. It is also not in conflict with the earlier mentioned demand that foreign economic contracts must be agreements in written form, because according to the 1980 international trade convention, correspondence, telegrams and telex are to be considered written forms.

(3) Contracts Requiring State Approval

The FECL, furthermore, specially prescribes that contracts which according to Chinese law or administrative regulations require state approval can only be considered concluded after such approval has been obtained. This mainly refers to contracts for joint ventures using Chinese and foreign capital, contracts for Chinese-foreign cooperative management enterprises, contracts for joint Chinese-foreign exploitation and development of natural resources, contracts for the transfer of technologies, compensation trade contracts and contracts for the processing or assembling of imported materials. These contracts can only become effective after approval by the organ charged by the state with the examination and approval of such cases. The time of conclusion of such a contract is, therefore, the date of approval by the organ in charge of its examination and approval, and not on the date when both parties sign the contract.

III. Performance of Contract and Liability for Breach of Contract

The FECL strongly emphasizes the seriousness of the contract; a contract has binding force as soon as it is entered into according to law. Both parties are obliged to fulfill the obligations stipulated in the contract, and neither party may arbitrarily alter or terminate the contract. If one party does not fulfill the contract or does not fulfill it according to the conditions stipulated in the contract, it would constitute a breach of contract, unless brought about by force majeure. The party that violates the contract is responsible for all consequences.

According to the provisions in Chapter 3 of the FECL, if a breach of contract occurs, the party not guilty of the breach of contract may adopt one of the following remedial measures:

(1) Compensation for Damages

Article 17 of the FECL prescribes that if one party has definite proof that the other party cannot fulfill his contractual obligations, the former party may temporarily suspend performance of his obligations, but must immediately inform the other party of the fact that he is doing so. When the other party provides a full guarantee of performance, the opposite party may no longer withhold performance. The party who suspends performance without definite proof that the other party is unable to fulfill its obligations shall be held responsible for a breach of contract. In this respect two questions have to have our attention: First, the "definite proof" that one party must have of the other party's inability to fulfill the contract. This alone will justify the party to suspend its own performance. Performance must not be arbitrarily stopped because of a groundless suspicion that the other party will not fulfill its obligations. The party that in this way would arbitrarily stop performance would be held responsible for a breach of contract. Generally speaking, definite proof of inability to fulfill the contract could possibly be a war or a blockade involving the country of one party, or the insolvency of a party. Second, if the other party provides a full guarantee of performance, the opposite party must fulfill its obligations and may no longer withhold performance. The term "full guarantee" ordinarily means a bank guarantee of performance, but could also be rights to some asset of the party in question (a mortgage or a pawn) or any other form of security.

(4) Cancellation of Contract

Cancellation of a contract actually means nullifying a contract that has already been concluded. This is an important legal step. Every country imposes certain limitations on the cancellation of contracts; it is not that any violation of one party would entitle the other party to cancel the contract. The Chinese FECL also imposes comparatively strict limitations on the cancellation of contracts. Only one of the following conditions allows a party to cancel a contract: (1) If the contract violation by one party seriously affects the economic results that the other party hoped to achieve through the contract; (2) If one party does not fulfill the contract within the time limit set in the contract and still fails to perform within a reasonable period of time allowed for delayed performance; (3) In case force majeure makes performance of all contract obligations impossible; (4) If conditions have arisen which the parties had agreed in the contract as reasons for cancellation.

(5) Other Reasonable Remedial Measures

These are provisions of a very broad spectrum. What particular remedial measure could be covered is determined to a large measure by the nature of the contract and the conditions of the contract violation. For instance, if the goods delivered by the seller in the case of a sales contract are not in accordance with contract stipulations, the buyer can demand of the seller the removal of the defect, or the replacement of the defective goods, or a reduction in price, etc.

Moreover, according to the provisions of the FECL, the party that suffers a loss due to the contract violation of the other party is under obligation to take appropriate measures to prevent aggravation of the loss. Otherwise, he may not demand compensation for losses that occurred due to failure to take prompt and appropriate action.

IV. Settlement of Disputes

Article 37 of the FECL prescribes that disputes arising from a contract may be settled through negotiation, mediation, arbitration or by lawsuit.

Friendly negotiations are consultations conducted directly between the parties after a dispute arises and leading to the settlement of the dispute among the parties themselves. In the course of negotiations both parties will make certain concessions and on finding these mutually acceptable will arrive at a reconciliation, without the need for any third party to participate.

Mediation is conducted between the two parties under the direction of a mediator, urging the parties to arrive at a reconciliation and to resolve the dispute between them. In China mediation takes place on the basis of mutual consent of the parties under the direction of the foreign economic relations and trade arbitration organization, and at times it may also be possible to conduct the mediation jointly with the arbitration organization of another pertinent country.

Arbitration is an important form of settling international economic disputes. According to the provisions of the FECL, cases of parties not wanting to negotiate or mediate the dispute, or having failed to reach agreement in negotiations or mediation may submit the dispute to arbitration by the Chinese arbitration organization or by a foreign arbitration organization, according to the arbitration clause in their contract or an arbitration agreement in written form signed sometimes later. The arbitration organization can accept only cases at the request of the parties, based on the arbitration clause of their contract or on an arbitration agreement; without such arbitration clause or arbitration agreement, the arbitration organization cannot accept and hear cases.

If the parties have no arbitration clause in their contract and also did not sign an arbitration agreement later on, each party may in case of dispute file a lawsuit in the people's court.

The FECL has, furthermore, clear and definite provisions on the assignment, alteration, cancellation and termination of contracts. Due to limitations of space, the present article cannot introduce these in further detail.

BRIEFS

ELECTRONICS EXPORTS PUSHED--The China Electronics Import/Export Corporation operates on behalf of the Chinese electronics industry which currently numbers some 2000 enterprises. Chinese electronics exports amounted to approximately $100 million in 1984. The number of products has risen from 20 in 1980 to a present 90. Exports are aimed at the United States, Japan and Europe and intensified efforts are to be aimed at South America, Africa and the Near East. [Bonn WEHRTECHNIK in German May 86 p 77] /7358

ELECTRICAL MACHINERY CONTRACT--Stockholm, 12 Apr (AFP)--Cewe Instrument AB, a Swedish firm specializing in electrical machinery, has won a contract worth eight million kronor (about U.S. $1 million) to supply a Chinese company in Beijing, economic sources said here Saturday. The Swedish company, based in Nykoeping, 100 kilometers (63 miles) southwest of here, has also signed a series of agreements for a 10-year technological alliance with the Chinese firm, which was not named, the sources said. Cewe Instrument AB won the contract, which may be followed by others, according to the sources, against strong competition from several large multinationals, including Siemens of West Germany. INTERVIEW WITH STATISTICS OFFICIAL ABOUT POPULATION ISSUES

Beijing JINGJI RIBAO (ECONOMIC DAILY) in Chinese 24 Feb 86 p 2

[Article by Cheng Yuan [4453 6678]: "A Discussion on Population, Interview with Sun Jingxin [1327 0352 2450], Head of the National Statistics Bureau Population Statistics Department"]

[Text] The population problem is the crucial component in the coordinated development of China's economy. The population situation and its effect on future development is a problem concerning everyone. Pertaining to this, we recently interviewed Comrade Sun Jingxin, who is head of the population statistics department of the National Statistics Bureau.

Sun Jingxin told us that in recent years China has been successful in controlling population growth. In the last 5 years China's planned birth rate gradually increased each year, which largely reflected that the total number of children being born to a woman of childbearing age fell dramatically. During the Sixth 5-Year Plan, the population increased by more than 12 million people annually, a reduction of more than 100,000 from the annual average of the Fifth 5-Year Plan. At the same time, the condition of the population improved greatly as child care was excellent, and both the disease and mortality rates fell noticeably. Life expectancy increased to 68 years, which is 11 years higher than in 1957 and also higher than the world average.

Sun Jingxin said that in the last 2 years, China's population growth had settled into a low period, but that this could not be misinterpreted to mean that the problem of controlling population growth had been solved. Compared to developed nations, China's growth rate is still one-third higher. This is especially a result of China's large population base and the tremendous inertia of population expansion. In the next 10 years, there is the potential for a lofty birth rate. If things get out of control and the population starts to grow wildly, the growth rate could attain unprecedented speeds. Even if the present overall birth rate of 2.2 percent gradually falls to 1.8 percent by the year 2000, the total population of China will have increased by 220 million. Thus the task of controlling population growth most assuredly cannot be relaxed. Sun believes that the most important thing that could hinder low growth rates in the population is the high rate of pregnancies. Because four-fifths of the females of childbearing age are in the countryside, in the future population control must be stressed in rural areas.

Because China's rate of population growth has declined quickly in the last 10 years, people are worried that China's population is aging. Sun Jingxin said that in general, if the elderly account for more than 7 percent of a population, it could be classified as an older population. In 1982, those 65 and up only comprised 4.8 percent of the population; it is calculated that by the end of the century it will surpass 7 percent. But because China's birth rate has fallen quickly, the population is aging rather swiftly. Furthermore, as China's total population is vast, the absolute number of senior citizens is correspondingly large. However, Sun feels that the problem of an aging population will not have that great an impact on the labor resource pool and its quality within the next half a century. Sun says that from now until the 21st century China's work force will continue to grow. In 2040, though the proportion of elderly in the population will reach 20.9 percent, the labor force will still have nearly 730 million people, which is 120 million more than in 1985. Within the next 6 years there will no longer be any shortage in the labor pool. In fact, it will be precisely the opposite, as pressure to find employment will become rather intense. Along with an increased number of senior citizens, care for the elderly will increase beyond what would naturally occur, but on the other hand, the need for child care will steadily decrease. Thus the proportion of the total population requiring care will decrease continuously before 2010, and by 2040 the 1982 level of 63.26 percent will still not have been surpassed. This indicates that there will not be a problem with a minority caring for a majority. Nevertheless, an increase in the population of the elderly necessarily creates a definite burden for society. Starting from the present, China must draw up plans and take steps to expand health maintenance and service facilities for the aged.

In discussing the condition and makeup of China's population, Sun Jingxin said that before liberation the nation's economy was backward, the cultural level was low and the illiteracy rate was more than 80 percent. Since the establishment of new China, though the illiteracy rate has steadily fallen, it is still higher than many developing nations. According to data from the third national population census, 34.5 percent of those 15 and up are either illiterate or half-literate, and among those who are employed, illiteracy is still a high 28.2 percent.

Sun Jingxin also gave us an analysis of the professional makeup of China's work force. He noted that at present 10.35 percent of the work force is employed in tertiary industries, which is not only vastly lower than the 67.9 percent in the United States and 56.5 percent, in Japan, but it is also lower than most other developing countries. The structure of China's tertiary industries is also illogical: services for production and daily life as well as service departments for raising scientific and cultural levels and the quality of life account for a very low proportion. Thus it is difficult to make headway regarding clothing, food, and general consumption problems. Enterprises and service units must set up their own service departments themselves. At present, among that part of the work force engaged in tertiary style industries, about one-third is scattered about in various enterprise units that are not classified as social service trades. These units are integrated systems and are universally either "large and comprehensive" or "small and comprehensive," and so they are known as "factory units that are societies unto themselves." The socialization of service industries is low, which hinders the professional effectiveness of all kinds of enterprises and agencies. Sun Jingxin thinks that the initiation and development of tertiary industries is an essential trend in furthering the division of labor and in steadily increasing labor productivity; it is a very important characteristic of a modernizing economy. China's superior, planned, socialist economy is the most fitting starting point for meeting the development needs of the whole society, for establishing and perfecting the social service structure, for modernizing social services, for increasing labor productivity and for accelerating economic development.

POPULATION

DEMOGRAPHIC RESEARCH ON CHINA'S ETHNIC MINORITIES REVIEWED

Beijing ZHONGGUO SHEHUI KEXUE [SOCIAL SCIENCES IN CHINA] in Chinese Vol 1, Jan 86 pp 79-90

[Article by LÜ Guangtian [0712 0342 1131]: "Review of Demographic Research on China's Minority Nationalities"]

[Text] Step by step, research on the population of the minority nationalities is becoming more thorough in China. Such research involves both ethnology and demography, and many countries around the world are taking it seriously. For example, Canada has investigated and made forecasts about the population of its Indian tribes. The USA is investigating natural growth, marriage and other aspects of the population of both its ethnic minorities and its blacks. Israel is developing its research of ethnic population, immigration and housing policies. (Footnote 1) (See Yang Yixing [2799 0001 2502] and Zhang Tianlu [1728 1131 6424], "Some Views on and Suggestions for Demographic Research on China's Minority Nationalities" (mimeograph), paper read at Second Symposium of the Chinese Ethnology Society). It is especially worth noting that Soviet research on the USSR's minority nationalities has gradually become a discipline known as ethnodemography; the monograph "Ethnodemography" by Keciluofu [4430 5417 3157 1133] was published in 1977. Generally speaking, no one has any differences on the objects of research in the discipline; it is the research methods that apparently still need to be discussed. In "Ethnodemography," Keciluofu asserts that "ethnodemography is a discipline whose primary object of research in the ethnic group. The discipline's central task is to use demographic methods to study the characteristics of the reproduction of each ethnic group's population." (Footnote 2) (Quoted in He Guoan [6320 0948 1344]: "Soviet Ethnology Studies Reality," Nationalities Institute, Chinese Academy of Social Sciences. See also "Ethnodemography Is a Discipline" in "Translations About Nationalities," 1983, issue 1). Here he stresses the use of demographic methods to study ethnic populations. We believe that this is insufficient. Research on the population of minority nationalities requires the use of both demographic and ethnological methods. This is because the population that is the object of demographic study has both natural and social attributes, while the essence of population is its social attributes. As far as the social attributes are concerned, the population process is determined by the social mode of production and by the contradictory movements within the superstructure suited to that mode. Generally speaking, therefore, demographic research should be done within the context of the contradictory movements among the productive forces, the relations of production, the superstructure and the economic base. This is the basic method of demography. But because minority nationalities have their own special social life, a fair number of them not only differ from the Han in their stages of social development and in the levels of the productive forces and the relations of production but differ even more greatly from the Han in their superstructures. Their own special social structure, culture, psychology,customs and habits all directly influence the population processes of the minority nationalities. When studying the demography of those nationalities, therefore, we need to apply more than the general methods of relatively high-level demographic research. We also need to apply the principles and methods of relatively low-level ethnology. Generally speaking, however, our comrades' discussions do not contain the distinction between these two levels; the research methods of ethnodemography are succinctly described as "necessarily both demographic and ethnological." This article also adopts this succinct description.

1. Conceptual Breakthrough and the Pursuit of Method

In the first half of this century, the study of the populations of minority nationalities had already begun in China. For example, our famous demographer Chen Da [7115 6671]--in his book "Modern China's Population" that he wrote before liberation--brought up policy issues concerning population growth among Xinjiang's minority nationalities and furnished materials on the population of some of the minority nationalities in the Kunming area in Yunnan. There are also the examples of the surveys of minority nationality populations that we can find in "Demographic Survey of 80 Miao Families in Southern Sichuan" by Yang Han [2799 3352]; in "Population Issues in Xikang" by Wu Wenhui [0702 2429 2547] et al; "Demographic Survey of the Miao of Xuyong in Southern Sichuan" by Hu Qingjun [5170 1987 6874]; and in "Contemporary Geographical Distribution and Population Estimates of Several of Yunnan's Aboriginal Peoples" by Tao Yunkui [7118 0061 6652]. All of them provide valuable material for ethnodemographic research. After liberation, Professor Sun Jingzhi [1327 2417 0037] was the chief editor of "The Geography of China," one of whose chapters discussed China's minority nationality populations. Particularly noteworthy are the following: in 1956 the Nationalities Committee of the National People's Congress organized 8 fairly large groups to investigate minority nationalities; in 1958 the Nationalities Institute of the Chinese Academy of Sciences organized 16 such groups. These groups conducted thorough field investigations of social history in every minority nationality region and accumulated plenty of demographic material. In their compilation entitled "Three-Volume Collection" and in the "Five Collections" that the State Nationalities Commission plans to publish, (Footnote 1) ("Three-Volume Collection" and "Five Collections:" starting in 1959, the two sets of investigative groups issued in succession "A Short History of the Minority Nationalities, "Brief Annals of the Minority Nationalities" and "The Minority Nationalities' Autonomous Regions." In 1979, the State Nationalities Commission organized an editorial board for "Five Collections on Nationality Issues. On the basis of investigative material from the past and of the three collections, the board planned to compose afresh the following: "Collection of the Short Histories of China's Minority Nationalities," "Collection of the Brief Annals of the Languages of China's Minority Nationalities," "Collection Pertaining to the Autonomous Areas for China's Minority Nationalities," "Collection of Materials on the Social Histories of China's Minority Nationalities" and "China's Minority Nationalities." By the end of October 1985, 134 copies had already been published; everything is to be published in 1986) there are special chapters and sections on the populations of every nationality and every region. All this has laid the foundation for the study of China's minority nationality populations.

In step with the development of demography and ethnology, the latter part of the 1970's saw even more researchers attracted to the investigation and study of China's minority nationality populations. The increase in the number of such researchers was conspicuous. To wit, the Chinese Ethnological Society was founded in October 1980, and the Chinese Demographic Society was founded in February 1981. In October 1981 there took place in Guiyang the "National Symposium on the Investigation and Study of Some Minority Nationality Populations." Based on the investigative materials and papers presented at this symposium, "Materials on the Populations of Some of China's Minority Nationalities" appeared in print after the symposium. (Footnote 1) (Special issue of "Newsletter of the Chinese Demographic Society," 1981, issue 5). In 1982 the "National Symposium on the Investigation and Study of Minority Nationality Populations" took place in Lanzhou and discussed the following: (1) the present state of minority nationality populations; (2) the characteristics of the development of those populations; (3) the influence of religion on the development of those populations; and (4) birth control among the minority nationalities. After discussing these issues, the symposium concluded: (1) that the minority nationality populations must have planned growth; (2) that the quality of those populations urgently awaits improvement; and (3) that investigation and study of those populations must be enhanced, especially the study of comprehensive and theoretical issues. This latter symposium shows that the standard of research on China's minority nationality populations has already risen greatly.

In recent years, ethnologists have produced the following noteworthy books in the field of ethnic populations: (1) "Population Handbook," edited in 1981 by Comrades Hong Kang [3163 1660] and Wu Zhongguan [0702 1813 6034], (Footnote 2) (Published in 1981 by the Chengdu Birth Control Propaganda Center) which elaborates fairly systematically and comprehensively on the objects and meaning of the study of ethnic populations; (2) "Some Views on and Suggestions for Demographic Research on China's Minority Nationalities" by Comrades Yang Yixing and Zhang Tianlu, which advances a set of tentative ideas on ethnodemographic research that combine ethnology with demography; and (3) "On Ethnodemographic Research" by Comrade Tao Changping [7118 7022 1627], (Footnote 3) (In "Interethnic Unity," 1984, issue 3) which sets forth valuable exploratory suggestions for the study of minority nationality populations. In addition, many comrades have done long-term field studies in minority nationality villages and obtained plenty of firsthand material. During 1980-4 China's press published a total of several tens of articles about research on minority nationality populations. The articles that examined the broad issues concerning China's minority nationality populations raised the following points:

1. At the time of the 1982 census, China's minority nationality population stood at 67.23 million and accounted for 6.7 percent of the country's total population. In terms of population growth, the minority nationality population increased at a generally faster rate than did the Han after liberation. During 1964-82, China's population grew at an average annual rate of 2.09 percent, while the analogous rate for the minority nationality population was 2.49 percent. In the 4 years from 1978 to 1982, the latter population increased at an average annual rate of 4.77 percent. In this way the nationalities of more than 1 million people, which numbered 10 in 1953, numbered 15 in 1982.

2. Although the minority nationality population is small in relative terms, it is not small in absolute terms, since the United Kingdom, France and West Germany all have populations of under 67.23 million. Moreover, because of the youth of the minority nationality population, there is a great potential for growth. In the not-too-distant future, it is bound to achieve a new peak in population growth.

3. This type of growth rate for the minority nationality population has already had two consequences. The first is the lack of coordination between population growth and economic growth, as cultivated land (grasslands) and other natural resources are decreasing year after year in per capita terms. The second is that the population has grown so fast that it is exceeding the progress made in the areas of culture, education and public health. This in turn has affected the improvement of health and education among the minority nationalities and has lowered the quality of their populations.

4. Before liberation, 29 of China's 55 minority nationalities were in the primitive stage, the slave stage or the serf stage of social development. Hence these nationalities' populations are still growing relatively slowly.

Most of the demographic literature on minority nationalities deals with the minority nationality population in a single region (e.g., Xinjiang, Ningxia, Guangxi, Qinghai, Yunnan, Guizhou, Gansu, Yanbian, Guangdong, Hunan, Fujian, Tibet or Sichuan). It consists of an introduction to the region's minority nationality population and an analysis of its population policy, materials and population composition. Some of the literature deals with the population of a specific people (e.g., the Dongxiang, Hui, Wa, Dai, Oroqen, Mongols, Tibetans, Yi, Jinuo, Koreans, Yao, Zhuang or Li). Representative works of this type of literature include studies of the Yi of LIangshan and of the Tibetans of Tibet, Sichuan and elsewhere. They will be reviewed later in this article.

In addition to the achievements of research mentioned above, the populations of the Kazakhs, Yugur, Tu, Shui, Jing, Mulam and Blang have also been investigated.

From the demographic literature already in print on the minority nationalities we can tell that some extremely valuable breakthroughs have occurred in this field in terms of academic concepts. In the first place, we are starting to take seriously the issue of population quality. In the past, we often looked upon the minority nationality population growth rate and the minority nationality population as a percentage of China's population as the sole criteria by which to judge the implementation of the nationalities policy. This was correct in a sense, but it also had a certain one-sidedness. Now, quite a few comrades point out that excessively rapid minority nationality population growth has meant lagging economic growth and that from now on we should make the improvement of population quality a major task. In the second place, we have explicitly raised the question of controlling the minority nationality population. Everyone has affirmed the necessity of controlling the growth rate in densely populated minority nationality areas. On the other hand, must we pay attention to controlling population growth in sparsely populated minority nationality areas like Tibet (1.6 persons per square kilometer) and Qinghai (5 persons per square kilometer)? Some believe that such areas can do without population control, while others hold the opposite view. The latter group of comrades believes that although minority nationality areas (like western China) are sparsely populated with an average density of fewer than 10 persons per square kilometer--some have an average density of under 1 person per square kilometer--the bulk of these areas are desert, high mountains or barren saline-alkali soil. They have an arid, cold climate with little rainfall. They lack substantial acreages of forest and vegetation as well as sources of water. Hence they can support only a limited number of people, which means that population control is an urgent task there.

In this writer's opinion, the published literature shows that although there has been a conceptual breakthrough in ethnodemographic research, the methodology is still plagued with a problem. This problem is simply limited to applying demographic methods while neglecting the ethnological angle. This tendency is primarily evident in the neglect of research on the original social formation of minority nationalities, in the lack of research on their economies and modes of production and in the lack of research on their marital and other customs and habits and even on their religious beliefs. For example, as far as culture, customs and habits are concerned, we must do in-depth studies of the extent to which religion has influenced and still influences changes in minority nationality populations; of the past and present influence of marriage patterns or birthrates and physical quality; of the function of family structures of all kinds in the population phenomenon; and of the influence of the feudal idea of male superiority, customs favoring females over males and other customs on population growth. The minority nationalities' population phenomenon is conditioned by social formation, culture and mentality. Only by using demographic and ethnological methods at the same time can we researchers make further breakthroughs.

2. Ethnodemographic Research in the Light of Every Kind of Social Formation

Marxism holds that the social mode of production determines demographic laws. The study of the demographic laws of minority nationalities requires us to begin with their modes of production, which indeed must be investigated within the context of the contradictory movements among the productive forces, the relations of production, the economic base and the superstructure.

Just after the founding of the People's Republic, China had a minority nationality population of more than 36 million. Approximately 4 million of those people lived in feudal serf societies, about 4 million lived in slave societies and more than 6 million still lived in the late stages of primitive society or retained pronounced vestiges of the primitive commune system. As is the case with these social formations, their economies still were characterized by gathering, fishing, hunting, nomadism and slash-and-burn agriculture; there were also many kinds of religious beliefs, as well as customs and habits. Although some of these minority nationality areas made a direct transition to socialist society while others arrived there through democratic reform, socialist transformation and socialist construction, all the leftovers from the old socioeconomic formations and the interrelated customs and habits still influenced the development of their populations.

Before liberation in the north, the Oroqen and some of the Ewenki lived in patriarchal clan communes and regional communes (or rural communes) characteristic of the late stages of primitive commune society. In Yunnan, this was the case with the Drung, Nu, Lisu, Wa, Benglong, Jingpo, Lahu, Kucong, Blang, Achang, Naxi and Jinuo; in Tibet with the Deng and Lhoba; on Hainan with the Li; and on Taiwan with the Gaoshan. As for their economies, the northern minority nationalities were primarily primitive wandering hunters, fishermen and nomads. In the south, the minority nationalities mainly engaged in primitive slash-and-burn agriculture, and to varying degrees retained the characteristics of clan communes or the disintegrating stages thereof. For example, the tribes of wandering Ewenki hunters in the north more or less completely retained the basic production and way of life of the patriarchal clan commune's communist system. Among these Ewenki, all of the members of the clan communes, which were based on ties of blood, practiced the principles of common production and equal distribution. (Footnote 1) (Lü Guangtian [0172 0342 1131]: "Primitive Social Formations Among Northern Nationalities," Ningxia People's Publishing House, 1981, pp 9-10). The social development of the Oroqen, on the other hand, had already reached the end of the primitive society and entered the stage of regional communes. The system of ownership was both public and private. Because of the considerable consolidation of the system of private ownership, phenomena like inequality in property and exploitation in the use of horse had already appeared. The Oroqen stood on the threshold of class society but had yet to complete this major historical transformation. (Footnote 2) (Ibid.). The population phenomena of the Oroqen and some of the Ewenki deserve study. For example, the Oroqen are one of China's smallest minority nationalities. Before they settled down in 1953, their population growth was little short of stagnant for a very long historical period. They belonged to the population reproduction category known as primitive, i.e., high birthrate, high mortality rate and negligible growth. This is a population phenomenon worthy of study. Quite a few researchers have taken note of this matter and attempted to explain it. Some comrades believe that the historical roots of this population phenomenon lie above all in the Oroqen's long period of production based on hunting, when life had no guarantees and their way of life was also extremely simple. At that time the Oroqen suffered political oppression and discrimination. Second of all, during the existence of the Japanese puppet state Manchukuo, the Japanese aggressors not only did not allow them to develop economically and culturally but also encouraged them to use drugs, thus doing serious damage to the Oroqen spiritually and physically. (Footnote 3) (Lin Shengzhong [2651

4141 0022]: "The Present State of the Oroqen Population in Heihe Prefecture and the Reasons for its Slow Growth," "Demography," 1984, issue 1). Other comrades have exposed the Japanese aggressors' massive spread of the germs of bubonic plague, typhoid fever and other diseases in Nei Monggol during those years, which claimed many Oroqen lives. Both these explanations are well-grounded and credible. Nevertheless, it must still be noted that the Oroqen were primarily a hunting people whose pre-liberation social development was still in the late stages of primitive society. Given the rather special nature of this nationality, it is perhaps inadequate to use only the medthods of general demography when studying its population. We believe that ethnological methods must also be applied in order to enable the discussion to be thorough. For example, let us do more in-depth research on the influence exerted on population growth by this nationality's marriage patterns, child-bearing system and way of life that is based on a primitive hunting society.

This writer believes four things. First, the Greater and Lesser Hinggan Mountains are one of China's backyards. In their stretches of several thousands of li of primeval forest has lived generation after generation of Oroqen and some Ewenki, with both groups being mainly wandering hunters. Before liberation, they used horses and reindeer to pursue and capture wild game in the immense forest throughout the year. Given their life of migratory hunting, their productive forces were extremely weak and the wild game limited in number. Hence life lacked guarantees. This backward mode of production naturally determined that their populations could not grow too fast.

Second, the primitive hunting economy determined that the Oroqen and some of the Ewenki would have a primitive type of population reproduction, i.e., one with a high birthrate, high mortality rate and low growth rate. Since these Oroqen and Ewenki were primarily meat-eaters, their child-bearing ability was fairly strong. Their women's lifetime child-bearing rates far exceeded those of women in ordinary agricultural and pastoral areas. For example, in the Qiganxiang area of the Ergun Left Banner in Nei Monggol, the hunter Piaodeer [4384 1795 1422] and his wife had 12 children, as did the hunter Yinakenqi [0181 6719 5146 3049] and his wife. The Dabayue [1129 0360 2588] had 10 members. Although these Oroqen and Ewenki had such high birthrates, the hardship of their lives of migratory hunting and epidemic disease both ensured high mortality rates. In the past, these nationalities lived in extremely simple and crude tents known as "immortals' columns." Before a woman gave birth, custom required that another tent be put up. This tent could hold only one person. It was called "jiuhahan," i.e., delivery room. Even during raging snowstorms in the dead of winter, the lying-in woman had to give birth there. Hence mother and newborn child often died of exposure and starvation. Moreover, once disease came to the primeval forest, it spread exceedingly fast. The Oroqen constantly suffered from surprise attacks of smallpox, cholera, typhoid fever and pulmonary tuberculosis that claimed many lives. By the time it reached 3 generations, the 1st family mentioned above had 27 members, but 11 of them died for a mortality rate of 40.7 percent. In the 3d family, 9 out of the 10 died for a mortality rate of 90 percent. (Footnote 1) ("Fifth Report of Findings on the Ewenki," Investigative Group for Minority Nationality Social History in Nei Monggol, p 34). Their entire tribe had more than 700 members in the 18th century, 435 in 1899, 315 in 1917, 170 in 1945, 140 in 1954, 141 in 1955, 138 in 1956 and 136 in 1957. Hence their numbers were always on a downward trend. Because the party and the government set up special medical establishments for them after 1957, their numbers had risen to 146 in 1960. (Footnote 1) (Survey done by this writer in 1957-8). During the 22 years from 1960 to 1982, the tribe gained only 40 members for an average annual increase of under 2 persons.

There is one other circumstance that affects population growth. Each clan or regional commune of a nationality of wandering hunters had regular hunting grounds. Because of the limited numbers of wild game, however, chasing wild game into others' hunting grounds often led to armed conflict. This also affected population growth.

Third, in order to investigate a nationality's population growth, we should also investigate that nationality's marriage patterns. The Oroqen and Ewenki marry outside the clan, but youth of marriageable age often could not marry. This was above all because of high mortality rates. At times even an entire clan commune became extinct. This brought about a sharp reduction in the number of clans among which marriage relations could be established, and so many youth of marriageable age had no spouses. Population growth was obviously affected. Moreover, because a clan had a "relationship of revenge" with another clan with which it could have had a relationship of marriage, the number of single males and females increased. Figures from a 1956 study of a 32-household Ewenki tribe show how severe the shortage of potential spouses for youth was: of the tribe's men who were 20 years old or older, 16 were single. Those 16 constituted 45 percent of the tribe's males. Of the tribe's women who were 20 years old or older, 14 had yet to marry. Those 14 accounted for 37 percent of the tribe's females. What is more, 9 households (i.e., 28 percent of the tribe's households) had no married adult males and females. In addition, the mode of production of wandering hunting perforce meant perennial roaming in the forest. Each clan commune was 100 to 200 li away from its nearest neighbor. Regular meetings took place only twice or three times a year. Such little contact placed extreme restrictions on intermarriage and having children.

Fourth, because hunters always have difficult production and living conditions, the Oroqen and Ewenki hunters commonly contracted pulmonary tuberculosis, which made for poor population quality. A 1956 general survey revealed that 86 (or 57 percent of the population) of 138 wandering Ewenki hunters had tuberculosis. In the Oroqen areas, about half the population had that disease.

Since the 1960's, the Oroqen and some Ewenki have begun the transition from the primitive type of population reproduction to the second type, which is characterized by a high birthrate, a low mortality rate and a high growth rate. Nevertheless, the leftovers from the old primitive socioeconomic formation still play a negative role.

One after another, the Oroqen and Ewenki left their wandering hunting behind and settled down in 1953, 1958 and 1965. Some researchers have made these remarks about the effect of such a change in life style on population growth:

1. Since they settled down, the state has spent several hundred thousand yuan to build a four-room brick house for every family and to set up medical establishments in the new housing developments. Hence living conditions have improved substantially. On the other hand, because the hunters were used to the fresh air of the forest, the incidence of pulmonary tuberculosis increased again after they moved into villages and small towns with polluted air. A medical census of 1982 in Baiyinna Township in Heihe Prefecture showed that 60 of the 153 Oroqen examined had tuberculosis. There were 246 Oroqen in the township at that time. (Footnote 1) (Lin Shengzhong: "The Present State of the Oroqen Population in Heihe Prefecture and the Reasons for its Slow Growth," "Demography," 1984, issue 1).

2. Because the Ewenki and Oroqen had long lived in the forest with its cold climate, they had long ago grown accustomed to excessive drinking. After settling down, they found it convenient to buy alcohol. Thus their excessive drinking became worse. As a result, population growth was affected.

First of all, excessive drinking affects the infant survival rate. Both sexes among the Ewenki and Oroqen drink too much. Alcohol consumed by pregnant women irritates their fetuses and prevents the normal growth thereof. Moreover, the babies cannot survive after birth. Hence infant mortality is rather high. In 1982, a survey of 187 women showed that after their peoples settled down, 186 of the 730 babies born to them died. This mortality rate was 25.4 percent. (Footnote 2) (Ibid.).

Second of all, heavy drinking causes family quarrels, more criminal cases and more cases of alcohol poisoning. All this leads to an abnormal increase in the number of deaths. The hunters all have guns. When they lose control after drinking, they often kill with them.

The chart on the next page consists of statistics on births and deaths among the Oroqen of the area of the Greater Hinggan Mountains during 1980-2. It shows that during those years, there were 15 births and 46 deaths, with at least 24 of the latter being abnormal (death by gunshot, hacking or poison or suicide by hanging). In this area, then, the Oroqen registered negative population growth. (Footnote 3) (Ma Yuqian [7456 5038 0578]: "The Oroqen of the Greater Hinggan Mountain Area," (mimeograph), August 1982).

Another example of abnormal death is to be found among the Ewenki of the Ergun Left Banner. There were 186 persons in the banner in 1982. After the Ewenki settled down in 1965, 5 persons drank too much and were beaten to death; 2 killed themselves after drinking too much; and 13 children died young because their mothers drank too much during pregnancy. In addition, eight persons are in prison for murder because they beat their victims to death after drinking too much. The banner had 143 Ewenki in 1960 and 186 in 1982. During those 22 years their numbers only increased by 43.

From all this we can tell that old customs and habits have had a major effect on population growth among minority nationalities.

Births and Deaths Among the Oroqen of the Greater Hinggan Mountain Region in 1980-2

Year	Births	Deaths		
		Total	Normal Deaths	Abnormal Deaths
1980	5	20	11	9
1981	7	13	6	7
1982	3	13	5	8
Totals	15	46	22	24

Here is another thing worth noting. Since the Oroqen and Ewenki hunters settled down, many new changes have occurred among them in such areas as marriage and population because they have begun to inhabit areas together with the Han. As an example, let us take the Oroqen settlements in Heihe Prefecture. The Oroqen make up 22 percent of the population in Xin'e Village, while the Han make up 78 percent. For Xinxing Village the corresponding figures are 14.5 percent and 85.5 percent and for Xinsheng Village 21.6 percent and 78.4 percent. (Footnote 1) (Lin Shengzhong: "The Present State of the Oroqen Population in Heihe Prefecture and the Reasons for its Slow Growth," "Demography," 1984, issue 1). We can tell that the Han population in these settlements predominates. This has a great affect on the economic and cultural lives of the Oroqen and Ewenki, as well as on their families and marriages. Foremost is the change in the area of marriage. Originally, half of the young Ewenki men and women could not marry. After their people settled down, 40 young men and women married either Han youth or youth of other nationalities. The newlyweds included 24 women and 16 men. Their 43 children definitely constitute the next generation of Ewenki. (Footnote 2) (Ibid.). Since the Oroqen and Ewenki settled down, their intermarriage with the Han has strengthened them and enabled them to increase their own population. This is undoubtedly beneficial to their social development.

The aforementioned population phenomena among the Oroqen and Ewenki constitute a model for the population phenomena occurring among northern China's nationalities of wandering hunters with relatively small populations. These nationalities are in the process of changing from primitive to socialist society.

South China has more than 10 nationalities with primitive social formations. They basically continue to use the primitive farming methods of "slash-and-burn" and rotating cultivation. Their productive forces are exceedingly weak. This type of primitive agriculture differs from the hunting in the north in that it relies primarily on increasing the labor force in order to increase production. A larger labor force means greater income. Thus there is a more urgent demand for a bigger population than among the hunters. The southern nationalities' marriage customs, however, have seriously affected population growth, even with calamitous consequences. Not so long ago, for example, nationalities like the Jinuo, Nu and Lisu still were primitive in that they married within the clan or the family and in that they had such vestiges as consanguineous marriage and communal marriage. Marriage between close relatives was even more common. Hence quite a few children suffered from congenital hypoplasia or physical degeneration. Some carried every kind of congenital and hereditary illness. As far as both physical strength and intelligence were concerned, these nationalities' populations were far inferior to those of advanced areas. "The Harm of Marriage Between Close Relatives as Seen in an Investigation of the Jinuo," an article by Du Yuting [2629 3768 0080] and Ruan Fangfu [7086 5364 6346], is representative of research on this problem. (Footnote 1) ("Population and Economy," 1981, issue 5). It illustrates the effect of Jinuo marriage patterns on population. There are more than 10,000 Jinuo, who are gathered in Jinuo Luoke Commune, Jinghong County in Yunnan's Xishuangbanna. At the time of liberation, they were in the late rural commune stage of primitive society. They still had vestiges like consanguineous marriage within the clan. For example, until the 1950's Baduo Village in the hinterland of Jinuo Luoke Commune was a consanguineous hamlet and, moreover, had only one clan. The prevailing custom was marriage between persons who were a generation apart; marriage between brothers and sisters was not customary. The hamlet's population never flourished. According to the recollections of septuagenerians and octogenerians, the clan had only 13 families and 80 members in its heyday. An 84-year-old woman of Baduo Village married a blood relative from her own clan. They had five children, the first three of whom died before the age of one. Their fourth and fifth children also died young. Marriages between close relatives have had catastrophic consequences for Jinuo population growth. The Jinuo had 36 more than 240 years ago; only a few remained on the eve of liberation. For example, long ago Shaoniu Village had an upper part and a lower part. Later, all that remained of the upper part was an empty foundation of a house; the last two residents had moved away. The danger of consanguineous marriage was the striking element in the disappearance of the upper part. The authors point out that the transition from marriage between close relatives to marriage outside the clan is long and hard. Some clans have now got rid of marriage between close relatives. Baya Village, for example, has forbidden marriage within the clan on pain of death. Some villages, however, stubbornly retain vestiges of that kind of marriage. Although that kind of marriage is forbidden in Yanuo Village, there is an accommodation: if two blood relatives from the same clan love each other and want to marry, the woman need only hold a ceremony wherein she recognizes an elder from another clan as her nominal father. In this convenient fashion she can gain customary approval of her marriage.

The custom of marriage between close relatives among the Nu and some of the Lisu resembles that among the Jinuo. "An Investigative Report on the Social History of the Nu" and "Yunnan's Minority Nationalities" are two books that provide us with valuable material on this area. Marriage among the Nu and Lisu is primarily single marriage, and no one may marry his or her father, mother, son, daughter, brother or sister. On the other hand, anyone may marry his or her paternal cousin or second cousin of the same surname. Moreover, persons from different generations, i.e., aunts and nephews and uncles and nieces who are related by blood--may marry. Furthermore, their system of transferring homes allows a man to marry his widowed daughter-in-law or his late father's concubine. Even more common is marriage between maternal cousins. According to a 1956 survey of 36 Nu households in Mujia Village in Fugong County, 5 persons had married paternal cousins, 2 had married maternal cousins and 5 had married members of another generation. A survey of 38 married couples in Jiajia Village in Bijiang County showed that 15 (39.5 percent) were outside the clan, while 23 (60.5 percent) were within the clan. (Footnote 1) ("Investigative Report on the Social History of the Nu," "Five Collections on Nationality Issues," Yunnan Provincial Editorial Committee, Yunnan People's Publishing House, 1981, p. 71). Marriage between close relatives has an extreme effect on the next generation, which has more than its share of mental retardation, deformities, hemophilia and other congenital defects. It obviously affects population quality. (Footnote 2) ("Yunnan's Minority Nationalities," edited by the Institute of History of the Yunnan Provincial Academy of Social Sciences, Yunnan People's Publishing House, 1980, pp 101, 102, 114). Thus population growth in some Lisu and Nu areas is fairly slow, and population quality awaits improvement.

The study of population phenomena among nationalities that had primitive societies beforeliberation has more than just theoretical significance. It is also of major practical significance. Because these phenomena occurred in primitive societies in which we can still search for their traces even today, it is obviously worthwhile to study them demographically, historically, ethnologically and sociologically. At the same time, such study has provided an important theoretical basis for our formulation of population policy. In addition, we can also see that it is precisely because of our application of both demographic and ethnological methods that we have the aforementioned knowledge of the population phenomena among these nationalities. It would be hard to imagine if we were to abandon ethnological methods and look forward to getting the aforementioned knowledge. This may serve as an excellent example to support the previously stated viewpoint on the methodology of ethnodemographic research.

Before democratic reform, the Yi of Sichuan, Yunnan and Big and Little Liang Mountains still lived in a more or less completely slave society. Comrade Xu Ming [1776 6900], in his article entitled "Demographic Study of the Slave Society of the Yi of the Liang Mountains" (published in "Studies of Guizhou's Nationalities," 1984, issue 3), makes the following points:

(1) Natural agriculture controlled the slave society of the Yi of the Liang Mountains, and its productive forces were weak. Hence the development of agricultural production and animal husbandry depended primarily on the growth of the laboring population.

(2) The society of the Yi of the Big and Little Liang Mountains was rigidly divided into four classes: the nuohuo, qunuo, ajia and xiaxi. The nuhuo was was the ruling class; the others were the ruled. The nuho made up 7 percent of the population, the qunuo 55 percent, the ajia 30 percent and the xiaxi 8 percent.

(3) The xiaxi, ajia and qunuo slaves who did corvee labor for their nuohuo owners frequently worked in a group of 20 to 30 on a piece of land under the supervision of a manager hired by the owners. The slaves had no interest in this kind of compulsory labor and often were slack in their work. Naturally their efficiency was low. Thus the slaveholders needed to increase the labor force in order to increase their income. First, they required the qunuo, ajia and xiaxi to marry early and have many children so as to shorten the reproductive cycle and to increase the labor force as much as possible. Second, to shorten as much as possible the time spent by lower-class children as consumers, the upper class did its best to make them take part in production early on (in general the children began engaging in agricultural production at about the age of 10). The amount of income for ajia and qunuo households, moreover, depended on the size and physical strength of their labor forces, so they too hoped for large families. In sum, the desire of both the slaveholding class and the ruled strata for population growth reflected the slave system's demand for a large increase of the population. On the other hand, the specific content of each class' demand for a bigger population in the Liang Mountains varied:

Nuohuo. Because the Nuohuo (the slaveholders) married their own kind, 30 percent of their marriages were between maternal cousins. Thanks to such a high rate of marriage between close relatives, the infant mortality rate was 60 percent. On top of that, armed feuds within the ruling class claimed many men's lives. Hence the Nuohuo had a high mortality rate as a class. Although Nuohuo women married young, they did not stay long in their husbands' households, generally moving in only at about age 30. By then they had lost many of their childbearing years, and their lifetime fertility rates were low as a result. All this led to negative population growth among the Nuhuo. Hence they urgently required an increase in their numbers lest they lose their position as the ruling class.

Qunuo. Because the slaveholders had the right to terminate the employment of the Qunuo (the class attached to the ruling class), Qunuo families did their utmost to have more children in order to avoid unemployment. Qunuo women spent a short time away from their husbands' households, and so their lifetime fertility rates exceeded those of Nuohuo women.

Ajia. The Ajia were the slaves who lived beside the slaveholders' house property. They had little property of their own. This made them hope for man many children so as to increase their labor force, grow rich and rise to Qunuo status. An Ajia had a wide range of possible spouses, and Ajia women spent an extremely short time away from their husbands' households. Hence the women had a long childbearing period and lifetime fertility rates higher than those of either the Nuohuo or the Qunuo.

In addition, the slaveholders sought to replenish the labor force by converting their personal slaves (the Xiaxi) into household slaves. To this end they often encouraged male Xiaxi to marry and start working and even forced them to marry. The Nuohuo hoped for the birth of many "little slaves" whom they would exploit.

(4) Before democratic reform, an Yi woman averaged 6.5 children, with an average of 3.5 surviving. Hence there were 1.75 surviving children per parent. Within each class, the numbers varied because women began giving birth at different ages. For the Nuohuo, the figures were 5.7, 1.7 and 0.85; for the Qunuo, 6.2, 3.4 and 1.7; and for the Ajia, 7.6, 4.3 and 2.15. These data show that the slaves in the society of the Yi of the Liang Mountains belonged to the expanding model of population reproduction, while their masters belonged to the shrinking model.

Comrade Xu Ming's article uses the specific facts about the population of the slave society of the Liang Mountains to prove the groundlessness of the belief that Engels' theory of "two kinds of production" is applicable only to primitive societies. (Footnote 1) (See Yang Kun [2799 1024]: "On Marx's Formula of Historical Materialism and Engels' Theory of Two Kinds of Production," "Studies in Ethnology," volume 7). At the same time it proves that a certain mode of production always determines a certain marriage system and a certain set of population laws. In the slave society of the Liang Mountains, class relations determined marriage and family relations, while the needs of the slaveholders determined, in the main, the population laws of each class. This article, however, does not take care to apply ethnological methods to the study of the population of the Liang Mountains, and so in some places its discussion is incomplete.

"A Brief Analysis of the Yi Population of the Liang Mountains," an article by Cheng Xianmin [4453 6343 2404] in "Social Sciences in China," (Footnote 2) (See issue 2, 1984) is fairly representative of the research that is now using a combination of ethnological and demographic methods on the population of the Yi slave society of the Liang Mountains. The article probes this society's laws of population reproduction from the angles of social formation, families and their branches and classes, as well as from the angles of family and marriage. On this basis, it delves further into the present status and tendencies of the population changes of every Yi social group now that the Yi have entered the socialist historical stage. It also provides some tentative ideas on how to control the population of the Liang Mountains and on how to improve its quality.

(1) Beginning with the composition of the Yi soicety's population before democratic reform, Cheng Xianmin points out that the way in which the black Yi (the Nuohuo) divided up their control had a negative influence on Yi population growth. This took the primary form of countless armed feuds between families.

(2) Cheng also points out the stratification of the Yi slave society. Every class' attitude toward having children and its systems of marriage and family were unavoidably linked to that stratification in a close fashion. He diasgrees with the belief that the Yi society of the Liang Mountains had uniform marriage customs and a uniform attitude toward having children. Indeed, the author discusses each class' different attitude toward having children. He clearly indicates that the narrow limits on the black Yi's intermarriage and the late entry of wives into their husbands' households severely hindered the growth of that class.

(3) The author believes that in the slave system of the Liang Mountains, economics and politics, as well as the marriage and family systems suited thereto, have determined the regional and generational characteristics of the age composition of the Yi population. For example, the Yi society had fairly small numbers of juveniles and elderly but especially large numbers of young adults and adults in the prime of life. This was a reflection of high infant mortality, sickness and quick death among the elderly and a short average life-span among the population as a whole. It was also a product of the environment peculiar to a slave society. The author also discusses the specific characteristics of the age compositions of the black Yi and their personal slaves, the Xiaxi, as well as the relationship between those characteristics and the positions occupied by the two classes in the stratified slave society.

Combining demographic and ethnological methods, Cheng Xianmin analyzes population growth in the Liang Mountains before liberation. His work makes a methodological breakthrough in the current study of minority nationality populations.

Besides the two articles mentioned above, there is also an article by Wang Duanyu [3769 4551 3768] and Zhang Guangxian [1728 0342 7359] entitled "A Preliminary Analysis of the Growth of the Tibetan and Yi Populations in Sichuan." (Footnote 1) (See "Northwest Population," 1984, issue 1). Taking Meigu County in the Liang Mountains as an example, this article analyzes the population both before and after the establishment of the People's Republic. It contrasts the population of each class but focuses on the post-liberation situation. This sets it apart from the other two articles.

Before democratic reform, some of the regions inhabited by Tibetans, Dai, Uygurs, Moinba and Naxi still retained serfdom. Quite a few comrades have studied the populations of these regions, with the most prominent work having been done on the Tibetans.

Before the establishment of the People's Republic, the Tibetan population was continuously declining. During the Yongzheng reign of the Qing dynasty, it stood at about 2 million (Footnote 2) (Yahanzhang [3660 0698 4545]: "New Writings on the History of Tibet," p 195, Sichuan People's Publishing House) and declined to about 1.2 million by the early post-liberation period. This 200-year decline amounted to 40 percent, or an annual average decline of 0.25 percent. The Tibetan population only grew by 24.5 percent from 1953 to 1978, with a birthrate of merely 23 per 1,000 in 1980. Both the two-century decline and the slow growth over a quarter century deserve study. Quite a few conrades believe that these two phenomena were closely linked to serfdom, Lamaism and polyandry in Tibetan society.

Under serfdom, agriculture and animal husbandry were exceedingly backward in Tibetan areas. Tibet's ruling class, i.e., the three big suzerains (the local government, the nobility and the lamaseries) and its agents made up only five percent of the population but owned all the land and all the means of production. The serfs, who were their owners' personal appendages, made up 90 percent of the population. They obtained land from their owners, by necessity, by performing services for them and paying rent and taxes to them. The "chaiba" (those who performed services) and the "duiqiong" (poor families) were the primary components of the serf class. The "langsheng," who were slaves, made up the remaining five percent of the population.

In 1984 "Nationality Studies" published in its second issue an article by Wang Duanyu entitled "Lamaism and the Tibetan Population." The author had studied the profound influence of Lamaism on Tibetan population phenomena.

(1) Wang believes that the peculiar trends of the Tibetan population are the results of a combination of economic and many other elements. Particularly worthy of serious attention is the influence of religion on population.

(2) Before democratic reform, the clergy in every county of Sichuan's Garze Tibetan Autonomous Prefecture constituted 30 to 50 percent of the male population. Of these clergy, 60 percent belonged to the Gelu sect (Yellow Lamaism). Yellow Lamaism's strict prohibition against married monks created a severe surplus of unmarried women.

(3) Many Tibetans did not marry, and most of them left home to become monks (if a household had three sons, two had to become monks). Their female counterparts were called "Buddhist mothers" (nuns). Some women could stay at home and still be "Buddhist mothers."

(4) Because Lamaism propagated the idea that human life had eight sorrows, the chief one of which was human birth, the struggling serfs considered childbirth a sorrow and felt that having many children was a sin. This attitude played a major restraining role as far as Tibetan population growth was concerned.

(5) Because of the influence of Buddhist thinking, Tibetan males had an apathetic concept of the family. Some shirked the responsibility of raising children. Hence the women's burden grew heavier, and so women were unwilling to have many children. There are prescriptions for birth control in ancient Tibetan medical texts, as is reflected in the Tibetans' tradition of birth control.

(6) Lamaseries were a component of Tibetan serfdom. They amassed much of society's wealth but could not use it for production. Hence they both impeded economic development and restricted population growth.

(7) Lamaism restricts the Tibetans' population phenomena and population process, and the abnormal development of Lamaism has been the principal reason for the historically steady decline of the Tibetan population. Because Lamaism, its relgious concepts and its view on having children still exert a fairly strong influence on Tibetan society to this day, Tibetan population growth has remained exceedingly slow since democratic reform.

Wang Duanyu reasonably names Lamaist influence as the cause of the Tibetan population's decline and subsequent slow growth. Religion is a form of ideology. Lamaism has prevailed in Tibetan society for a millennium. It differs from Han religious phenomena, in that its wide range in Tibetan society and the degree to which the Tibetan masses profess it are conspicuous sociocultural phenomena. Some of its doctrines have formed a kind of psychological sediment that the Tibetans' cultural mentality has absorbed. Wang's article can study the Tibetans' population phenomena and population process from this angle, and so it is valuable methodologically. Its inadequacy lies in its near inability to discuss in greater depth these two questions: how different were the attitudes of each class under serfdom toward having children? What role did Lamaism play in the formation of these attitudes? How was the surplus of unmarried women reflected in each class? Moreover, he scarcely writes about marriage patterns--a major omission.

I believe that in addition to the influence of Lamaism, the peculiarity of the Tibetans' population reproduction model as determined by serfdom manifests itself in the polyandry practiced by the serfs. Both before and after democratic reform, this marriage pattern has been commonplace among the Tibetans.

Comrades Ren Zhenluose [0088 4176 3157 5331] and Song Enchang [1345 1869 1603] have investigated Tibetan polyandry fairly thoroughly. (Footnote 1) (Ren Zhenluose: "Polyandry Among Tibetans in the Kang Area," "Studies in Ethnology," volume 7, p 141; Song Enchang: "Remnants of Tibetan Communal Marriage," "Studies in Ethnology," volume 2). In their articles they first of all provide some statistics. In 1958 10 of the 141 households in Nangsecunxika, Zhanang County, Shannan Prefecture, Tibet were polyandrous. In 1982 an investigation revealed polyandrous households in Luhuo, Garzê, Sêrtar and Baiyu Counties in Garzê Tibetan Autonomous Prefecture. For example, 14 of 227 households in Laima Township in Garzê County were polyandrous, as were 31 of 133 in Shadui Township in Xinlong County. In Baiyu County, some cadres, workers and staff members belonged to polyandrous families.

Comrade Ren Zhenluose generalizes about the types of polyandry among the Tibetans in the Kang area as follows: (1) brothers sharing the same wife; (2) several friends sharing the same wife; (3) a monogamous woman with many "husbands" behind her legal husband's back; (4) an unmarried woman with many "husbands;" (5) a woman with many legal husbands; (6) father and son sharing the same wife. Such polyandry has an extremely unfavorable effect on population growth, because monogamy and polyandry are similar or equal in terms of reproductive ability. The prevalence of polyandry has affected the growth of the Tibetan population. The negative growth registered during 1953-64 was closely linked to both polyandry and the celibate lamas who accounted for a quarter of the population.

The distribution of polyandry among the social strata varies from place to place. Generally speaking, it is relatively more common among well-to-do and rich serf households and among small peasants with a certain amount of property. In some places, however, sons from one household share the same wife, even though their household is not well-to-do and lacks sufficient property to divide among them.

Wives in polyandrous households occupy a fairly high position. They control the finances, take part in production, tend to the children and hold the economic balance.

Comrades Ren and Song also explore in their articles the reasons for the existence of polyandry. In their opinion, it is the product of a serfdom established on a backward and low level of production. For example, if the family property and labor power of the chaiba were dispersed, the chaiba could not withstand the exploitation by their owners. Ren Zhenluose discusses this point in even greater detail: before democratic reform, the Tibetans of the Kang area bore the heavy burden of the corvee labor known as wula. If a family had one able-bodied man, he had to spend two-thirds of the year on outside corvee labor, which occupied the serfs' essential labor time and depleted the agricultural labor force. Those families with only one able-bodied man obviously were hard put adapting to the ruthless exploitation of serfdom, while polyandrous families could avoid the division of family and property among brothers. Families thus maintained had a certain amount of wealth and many able-bodied men. Hence this kind of marriage and family pattern resulted from adaptation to the cruel exploitation of serfdom. As was mentioned above, it was extremely unfavorable to population growth.

Under Tibetan serfdom, polyandry and the abnormally large number of clergy created a surplus of women among the serfs and langsheng. Overall sex ratios in many Tibetan areas show females outnumbering males. It must be said that this is yet another peculiarity of the Tibetan population, about which Zhao Xuedong [6392 1331 5516] and Wang Ke [3769 0344] wrote an article. (Footnote 2) (Zhao Xuedong and Wang Ke: "A Brief Discussion of Tibetan Sex Ratios," "Population and Economy," 1984, issue 1).

Since democratic reform, and especially since the 3d Plenum of the 11th CPC Central Committee, the Tibetan population has entered a stage of accelerated growth. Tibet had a population of 1,622,330 in 1979 and 1,786,544 in the 1st half of 1982. During those 3.5 years it grew by 163,614 for an average annual increase of 2.74 percent. Tibet's population reproduction model has basically changed from one with a low birthrate, a high death rate and negative growth to one with a high birthrate, a low death rate and high growth. (Footnote 3) (Ibid.).

Before liberation, most minority nationalities had a feudal landlord economy. Studies of their population phenomena all note their prominent feudal consciousness, their regarding of men as superior to women and their early marriage. For example, according to old Hui custom girls reached adulthood at age 9 and boys at age 13; hence there were fairly many early marriages. Although things are different now, rural girls still marry at the age of 15 or 16 and rural boys at the age of 16 or 17. In 1980 early and illicit marriages accounted for about half the marriages in Zhangjiachuan Hui Autonomous County in Gansu. In rural Ili Prefecture in Xinjiang, boys and girls generally marry at 15 or 16, and marriages at 18 are considered late. Wives are constantly having children, so that by age 30 they generally have borne 10 or more. Families generally have five or six or even eight or nine children. In Dehong Dai-Jingpo Autonomous Prefecture in Yunnan, a fair number of persons marry at age 14 or 15 or even 12 or 13. They are parents by age 15. The largest number of children per couple is 17. A family of six or seven children among the Jingpo is fairly common. (Footnote 1) (Zhou Qing [0719 3237] and Xiong Yu [3574 6735]: "Several Points About the Growth of China's Minority Nationality Population," "Population Studies," 1984, issue 2). Early marriage is also prevalent among the Lahu, whose girls marry at age 14 or 15. If Lahu girls have not married by age 18, they are called old maids and are ridiculed. The Zhuang, Jing and Mulam of Guangxi, the She of Guangdong and the Shui of Guizhou have similar marriage customs. Research on this matter indicates that these nationalities' early marriage and many children born too close to each other chronologically mean blind population growth, economic burdens for families, poverty, a low level of education and poor health for both adults and children.

Furthermore, the many nationalities with feudal societies believe that the children of one's sons are one's own posterity and that without sons, a man is the "last of his line." They strongly feel that males are superior to females and even have a rule that those who die without a male heir cannot be buried in the "ancestral cemetery." According to old Yi tradition in Ninglang County in Yunnan, only persons with a son were truly "human," while persons without a son were inferior and could not stand tall. Some researchers point out that these customs and ideas are extremely unfavorable to the practice of birth control. (Footnote 2) (Guo Dalie [6753 1129 3525]: "Old Traditions and Ideas Are the Crucial Reasons for the Fettering of Socioeconomic Development in Nationality Areas," "Social Sciences in Yunnan," 1983, issue 4).

3. Concluding Remarks

In sum, it can be seen that although the population phenomena of China's minority nationalities vary on the basis of each nationality's original society and economy and on the basis of each nationality's different culture and psychology, their population reproduction models have nevertheless changed. Before the establishment of the People's Republic, they essentially all belonged to the primitive model of population reproduction, i.e., high birthrate, high death rate and low growth rate. In the case of the Tibetans under serfdom, the birthrate was low, the death rate high and growth negative. Since the establishment of the People's Republic, and especially since democratic reform, the population model of each minority nationality has basically changed to one with a high birthrate, a low death rate and high growth. This kind of model also has the characteristic of a young population, which means peak population growth in the future. This needs our attention. Also noteworthy is the trend among minority nationalities like the Koreans, Bai, Dongxiang and (in some areas) Zhuang--that are practicing birth control fairly well--toward a model with a low birthrate, a low death rate and a low growth rate. (Footnote 3) (Zhang Tianlu: "Characteristics of and Changes in the Population Reproduction Models of China's Minority Nationalities," "Social Sciences in Yunnan," 1983, issue 4).

As far as the formulation and implementation of population policy concerned, demographic research on minority nationalities has also produced the following results that are valuable for reference:

(1) We must both pay attention to controlling minority nationality population growth and guard against arbitrary uniformity. On the basis of individual autonomous counties (banners) and in accordance with each nationality's socioeconomic development and population base, we must formulate a birth control policy suited to each area's specific circumstances. Some minority nationalities have rather large populations, rather high population densities and population scales and growth rates that have repressed or will repress their productive forces. On the one hand such nationalities must control their populations and in a planned way lower their birthrates and slow their growth rates. On the other hand they must take resolute economic measures to ensure the success of their population control policies and, moreover, to accelerate the pace of production of material goods so as to raise the people's living standard constantly.

Other minority nationalities have small populations, low population densities and rather backward economic development. These nationalities should adopt a policy of appropriate population growth. We should also help them develop their economy, education and health care so that their economies and populations can grow at the same time. For example, the Oroqen have a population of only 4,200 and hence are proper candidates for such a policy. Among the Oroqen of Heihe Prefecture, however, birth control has already begun, and each family has an average of 2.2 children. (Footnote 1) (Lin Shengzhong: "The Present State of the Oroqen Population in Heihe Prefecture and the Reasons for its Slow Growth," "Demography," 1984, issue 1). Such premature practice of birth control deserves discussion.

(2) When studying the issue of minority nationality population from an ethnological angle, we should also point out some minority nationality social systems, customs and habits that favor the practice of birth control. For example, the society of the mountain Yao (i.e., the Chashan Yao, the Hualan Yao and the Ao Yao) in Guangxi has a tradition of birth control. Their household composition is generally "two, two, two," which means that a couple has two children who support a pair of elderly persons. Each family designates only one child, male or female, as heir and marries off its daughter (or sends its married son to live in his bride's household). This is called "giving the inheritance to one child." The mountain Yao headmen say: "We have little farmland in the mountains. If we had many people, our supply of rice would be inadequate. You notice we have neither beggars nor robbers here." This is their simple recognition of the dialectical relationship between the production of material goods and human reproduction. This part of the Yao nationality has a special method of using Chinese herbal medicine to discontinue pregnancy. Their annual population growth rate has always stayed at approximately 8.3 per 1,000. (Footnote 2) (Liu Yulian [0491 3768 5571] (a Yao): "A Brief Discussion of the Issue of Having Children Among the Chashan Yao, the Hualan Yao and the Ao Yao" (mimeograph), paper read at Third Symposium of the Chinese Ethnology Society).

Furthermore, quite a few of China's minority nationalities do not believe that males are superior to females but instead believe that it is immaterial whether one has a son or a daughter. Among them there is even the customary belief that it is more gratifying to have a daughter. For example, male and female occupy equal positions in the household among the Dai, Tibetans, some Naxi, Qiang, Lahu, Zhuang and Dong. Among some nationalities both males and females enjoy the right to inherit property. The Lahu esteem girls so much that the birth of a daughter pleases them more than the birth of a son. In the areas inhabited by these nationalities, the prevalent custom is for a husband to live in his wife's household or for a family to marry off its sons and keep its daughters. It is the duty of husbands who live in their wives' households to support their parents-in-law; in those households they are looked upon as the real sons of their parents-in-law. This custom basically solves the problem of taking care of the elderly and effectively controls population and reduces the number of unnecessary children (borne in an effort to produce sons). It should receive vigorous publicity and promotion. (Footnote 1) (Yang Heshu [2799 7729 2579 et al.: "Investigation and Analysis of the Population Question in Longsheng Multinational Autonomous County in Guangxi," "Studies in Ethnology," volume 5).

(3) The customs of the minority nationalities include many village compacts and stele systems. The Dong and Yao used to have a common law of "sincere agreements," as well as regulations concerning production, marital agreements, debt, defense and arrest. All the minority nationalities have the virtue of keeping their promises: once they conclude an agreement, they can abide by it scrupulously. We can utilize their sincere agreements to conclude pacts on birth control. In Guangxi's Longsheng County, for example, this method has obtained fairly good results. (Footnote 2) (Ibid.).

(4) In minority nationality areas where religious influence is still rather strong, we should unite with the religious leadership to help publicize birth control work. Practice proves that unity with that leadership encourages them to promote birth control among the masses of believers, which is often more effective than general propaganda. For example, in 1981 in the Hui areas of Jingyuan County in Ningxia, there was unity with the imams in birth control work, whose results were thus fairly good. (Footnote 3) (Tian Guang [3944 1639]: "Investigation of the Hui Population of Jingyuan County, Ningxia" (mimeograph), paper read at Second Symposium of the Chinese Ethnology Society).

POPULATION

RAPID DECLINE IN CHINESE FERTILITY EXPLAINED

Beijing RENKOU YANJIU [POPULATION RESEARCH] in Chinese Vol 1, 29 Jan 86
pp 10-16

[Article by Wu Cangping [6762 3318 5493], of the Demography Institute, China People's University. Paper presented at the Fourth National Conference on Demographic Science: "Theoretical Explanation for the Rapid Decline of Chinese Fertility"]

[Text] The decline in Chinese fertility has been known throughout the world since the 1982 general census of the Chinese population. The 1/1000th national fertility sampling survey reported that the overall fertility is 2.6. According to the latest figures from the National Statistical Bureau the 1984 birthrate was 1.7 percent and the overall fertility was 1.84. (Footnote 1) (Health News, Family Planning Edition, 12 November 1985) This achievement by a still economically and culturally undeveloped socialist country in bringing its fertility down to the replacement level attracted worldwide attention and praise. Many foreign friends call this one of the great marvels of human history. Yet in recent years some people who bear enmity for the Chinese people or, who because of prejudice, have greater knowledge than they have understanding of China's population problem have bitterly criticized this reduction in China's fertility. They claim that the decline in China's fertility was achieved through coercive policies. Thus scientific discussion of the causes of the rapid decline in Chinese fertility is not just an academic question but one of practical significance as well.

I. The Socialist System Created Favorable Social Conditions for the Rapid Decline in Our Country's Fertility

The most fundamental reason for the decline in fertility is economic development. If a certain degree of economic development is not achieved, there can be no decline in fertility. Our country's process of industrialization and urbanization brought the influence of the modern mode of production and modern lifestyles to every family and every individual and freed them from the shackles of the traditional family. They sought to improve the quality of their children, improve the quality of their lives and thus tended to reduce fertility voluntarily. Although the economy operates on the macroscopic scale, decisions on fertility are made by individuals and families on the microscopic level. Thus the effect of the macroeconomy on fertility is not direct and nor is it always immediate. Economic development must work through socioeconomic factors influencing the family and the individual which induce couples to change their views on fertility before it can eventually influence reproductive behavior.

The experience of developed countries and of developing countries demonstrates that once socioeconomic factors which determine fertility, such as changes in the function of the family, decline in mortality and especially in infant mortality, an improvement in educational standards, improvement in the status of women and particularly improvement in the employment opportunities for women, social guarantees for the elderly, yearning for the modern mode of production and a modern life-style, a family planning policy and the dissemination of birth control information to many people occur, they will lead to a decline in fertility. The earlier these conditions appear and the more of these conditions that appear, the faster will be the decline in fertility. Our country is a developing socialist country. Although our country is making great economic progress it is far from being a modern country. The social conditions that brought about the decline in our country's fertility are due in large part to our country's socialist system, public ownership of the means of production, and the planning of the national economy. Furthermore the distribution of wealth is fairer in our country; there are no great extremes of wealth and poverty; far-reaching social reforms have been made in every area; and the present development of science and technology has made the social conditions which promote the change in fertility appear earlier and faster in China than they did in the past in the developed countries or are appearing in developing countries today. I will try to explain several of the aspects of these changes listed below.

A. Change in the Function of the Family and Traditional Concepts: The view that people should have many children arose from the traditional feudal family. Although the feudal view that the more children the better has long been held in China, since new China was founded the social basis of this feudal view that having many children is better has been shaken to its foundation through many different democratic reforms. Although throughout history the family has been the unit of production, since land reform and the collectivization of the means of production this has greatly changed. The educational function is no longer the responsibility of the family but has become the responsibility of the state and the collectivity. The principle of distributing according to one's labor has greatly changed the relations of family members and relations between families. Small families have the chance to develop. Under socialism changing the functions of the family and traditional family concepts does not necessarily require a high degree of modernization. Relying on social reform to accomplish these tasks is entirely possible.

B. Popularize Education To Raise the Educational Level of the Entire Population and Foster Education in Collectivism: The popularization of education and in particular the popularization of education among women is an important cause of the rapid decline in fertility. The 1982 general census of the population and the 1/1000 fertility sampling survey of the entire country shows that women with a lower middle or a middle school education or better have on average 0.5 to 1 and 0.8 to 1.2 fewer infants. Although today China does not have a high average level of education, the number of primary and middle school students attending school has increased from several times to several tens of times. In 1949, there were only 1,268,000 middle school students attending school. In 1983 there were 56.78 million, an increase of 45 times. The number of primary school students increased from 24.39 million to 150 million an increase of 6.2 times. The fertile age cohorts of the 1970's were mostly educated during the 1950's. This necessarily caused the birth rate to decline. Under China's socialist system every level of education is free and education is supported and run by the state. Education is sometimes run by collectives or by localities as well. In China's circumstances it is not necessary to develop production and modernization to a high degree to popularize primary, lower middle and middle school education.

The problem of family size often reflects contradictions in the individual, the family, and the state. Chinese education, in line with socialist principles, lays great stress on education in collectivism. For a long time it has been educating the people in the interests of the collective and in the long-range interests of the country. Moreover it has fostered education in the rule of law, in communist morality, and has developed spiritual culture. This education which China has been carrying out for 30 years has, of course, considerably aided the decline in fertility. This is something the West cannot do and cannot easily understand.

C. Raising the Status of Women: Improvement in the status of women has made them realize that they are not just a machine for giving birth to and educating children. This is an important reason for the decline in fertility. Our country's popularization of education among women by expanding employment opportunities for women is another important condition for the decline in fertility. Since the founding of new China the improvement in the status of women on many fronts has surpassed that in many developed countries which have had movements for the emancipation of women for 100 or 200 years. Chinese women are not only the equals of men before the law in every area, such as government, education, and employment, but are also asking that they may gradually become the true equals of men. The 1982 general census of the population shows that Chinese women have a higher employment rate than any country in the world. Throughout the world employed women have, as a rule, lower fertility than housewives. China's social policy guarantees the equality of educational and employment opportunity for men and women.

D. Decline in the Death Rate: A decline in the death rate, and in particular a decline in infant mortality, is a necessary precondition for a decline in fertility. Historically, spontaneous declines in human fertility have been preceded by declines in the death rate. When the death rate is high, the survival rate of children is very low. Without high fertility these losses could not be made up. Once the death rate declines and the survival rate of children rises, many different factors will lead a family to spontaneously limit family size. If families are too large, people will feel it is difficult to support them, improve the quality of their lives, and for their children to get better employment. The decline in China's death rate since liberation is among the fastest in the world. Infant mortality fell from 20 percent at liberation to 3.5 percent in 1981 while life expectancy climbed from 35 to 68 years. The principal reason for the decline in China's death rate is the concern of our country's government for the health of the people and its development of health facilities. Prevention is the main policy. In the cities and in the countryside new methods of midwifery and of protecting the health of mother and child were popularized. Rural medicine and health were stressed. Moreover China adopted many different medical systems for medical care including payment by the state, and free and reduced fees for services. The best results and measures of medical science achieved anywhere in the world were adopted. To lower its death rate and still achieve excellent results, China does not need to spend the enormous sums on health care that Western countries do.

E. Provide a Certain Degree of Social Guarantees for the Elderly: In economically undeveloped countries raising children for security in old age is an important reason why families want to have many children or a boy. However, since new China was founded a retirement system has been established for staff and workers and labor insurance created for the workers. Although the villages have no social insurance system, collectivities have taken on the responsibility of supporting and helping the elderly and according to their economic level implement to differing degrees the "Five Guarantees" [childless and inform persons are guaranteed food, clothing, medical care, housing and burial expenses]. Several villages which are better off economically have begun a retirement system. Moreover the state and society help childless elderly people who have no one to depend on for support. The constitution clearly stipulates that "Citizens who are elderly, sick, or have lost the capacity to work have the right to material help from the state or from society." Although China is not a developed country, the people have already seen that sharing the wealth is the fundamental principle of a socialist system and accordingly are convinced that as the economy develops the elderly will enjoy social guarantees late in their lives. This to a certain extent weakens the idea of having children to provide for one's old age which is a great obstacle to reducing fertility.

F. China's Social Organization and Dissemination of Various Kinds of Information Accelerated the Exchange and Development of Birth Control Information and Methods: During the 19th century and the early part of the 20th century birth control depended principally on the communication of birth control experience from one person to another. In general, the modernization of communications has accelerated this process. China has special advantages in communicating birth control information. One is that public ownership of the means of production has made the social organization of China sound. China's household registration, food rationing, and many other institutions all require administration by different kinds of residential committees and grassroots organizations. The second is that since the founding of new China communications and transportation networks have spread everywhere. The third is that China accumulated thorough knowledge of organizing at the grassroots during the long revolutionary war. Thus, although televisions and telephones are not common in China's cities and rural areas and there are still illiterates, practically every corner of the country has mail and telephone service as well as wireless and wired closed-circuit broadcasts so that important information reaches everyone very quickly. The penetration of important information is even greater than in some countries with the most modern advanced means of communication.

Our country's social environment in many direct and indirect ways influences families and individuals and thus affects their reproductive behavior. This is shown in two principal ways: 1) changes in views on reproduction. Under the new social conditions the older generation no longer holds strongly the view that more children are better and the younger generation thinks that having many children is an odious and backward idea and leans toward smaller families. 2) The social environment has cleared a large way for smooth progress in China's family planning. For the last 30 years China has had social conditions appropriate for a decline in fertility. This process continues today. Likewise, declines in fertility did not appear at once. These declines are rather the result of ideas gradually and inconspicuously penetrating the age coherts of reproductive age under China's special social conditions and bringing about a gradual change in their views on reproduction.

The significance of social conditions favoring declines in fertility shows us that we must create even better social conditions in order to consolidate the downward trend in fertility. The economic reforms in China's cities and countryside and the further opening China to the outside world have raised doubts in the minds of some about family planning work. Particularly after the villages implemented the responsibility system, the people believed that some families have greater productive capacities than others and the villages want to have more children in order that they will have the labor of the children. Experience demonstrates that once the truth has been explained clearly, peasants living under socialism will not heedlessly seek to have many children. They realize that depending upon the manual labor of children to get rich has little chance of success and that it will not get a "return" on "family investment" for a long time. The peasants have seen that the forces of production are moving ahead and that an uneducated simple labor force is a drag on the family and society. Only by relying on a labor force with a certain degree of scientific and technical skill can production be developed and people achieve wealth. Statistics show that China with an overall fertility in 1984 of 2.0, a decline from 2.63 in 1981, has already reached the replacement level. This convincingly demonstrates the implementation of the responsibility system in the villages will not change the basic downward trend in fertility.

With the economic reforms in the cities and the countryside, the urbanization of the population is accelerating, industry in the countryside and in the townships is prospering, and several modes of management are developing which are transforming the old structures of production in which agriculture played the dominant role. Laying aside the matter of the modernization of production, the modernization of daily life also influences Chinese society to a varying degree. Electric and electronic products have become consumer products which people with small families in the city and the countryside can realistically aspire to own. The desire of people for a modern way of life is also going to influence people in the reproductive age cohorts to reduce their fertility. Thus the prospects for low Chinese fertility are optimistic.

II. The Effect of Family Planning on Inducing and Accelerating the Decline in Fertility

China's family planning work most definitely had a very large part in the rapid decline in Chinese fertility. However if we ignore changing social conditions and believe that we can rely on family planning alone to change fertility, this is no different from denying that the change in the population is an objective law and holding that the population may be manipulated as one desires. The great effectiveness of family planning is making a change in fertility appear earlier or making fertility decline faster once the social conditions favorable to a change in fertility have appeared.

Thus, Chinese fertility could decline rapidly once a favorable social environment for changes appeared. Individuals and families spontaneously desired to limit the size of their families. China's population policies could benefit from these favorable trends and use family planning to considerably accelerate the rate at which fertility declined.

In Europe and in some of other areas of the world, countries have found that when there is social and economic stagnation relying on family planning alone is not very effective. However, once fertility has begun to decline by one-tenth, declines in fertility accelerate and can continue. Therefore the acceleration in the decline in China's fertility does have a historical basis.

China has carried out family planning for a fairly long period. During the 1950's this began to safeguard the health of mothers and infants. At the beginning of the 1960's, family planning was promoted as "control appropriately the rate of natural increase of the population" but since family planning was in a very early stage and it was not yet carried out vigorously the results were unclear. During the 10 years of chaos family planning, paralyzed by anarchy, was carried out in fits and starts. At the beginning of 1973 the State Planning Conference explicitly made population part of the economic plan and the State Council set up a committee on family planning. In 1974, Comrade Mao Zedong declared that "the population must be controlled" in December of that year, again set forth the slogan "births should be late, well spaced and few" and made birth control medicines and equipment available free of charge. Family planning came to have an ever greater importance to China's daily agenda. However, deep understanding of the population problem and vigorous promotion of family planning came only after the "gang of four" was smashed, and especially after the Third Plenum of the 11th CPC Congress. The call for each couple to have only one child did not come until 1979 as appeared in the 25 September 1980 "Open Letter" of the CPC Central Committee. However, the decline in China's fertility began in the late 1960's and signs of a decline in fertility appeared in some areas even earlier than this. At the outset of the 1970's, this trend was obvious but family planning had not yet fully demonstrated its effectiveness. Only after the mid-70's was the effectiveness of family planning in accelerating the decline in fertility well understood. The following aspects of the time series suffices to demonstrate the accelerating functions of the spontaneous decline in China's fertility and family planning.

A. Age at First Marriage: Historically, changes in fertility have almost always begun with a rise in the age at first marriage. According to the 1/1000th fertility sampling survey, the age at first marriage in China began to rise in the 1940's. After the founding of new China the tendency for the average age of women at first marriage to rise became more evident and early marriage became nearly extinct in the cities and rare in the countryside. The average age at marriage rose steadily. The peak years for marriage and having children rose steadily. The data is presented below.

1. Change in early marriage by Chinese women: The proportion since the 1940's of women 15 to 17 already married: 1940, 51.4 percent; 1950, 48.3 percent; 1960, 32 percent; 1970, 18.6 percent; and 1980, 5.2 percent.

2. The change in the average age of Chinese women at their first marriage is as below:

	1940's	1950's	1960-64	1965-69	1970-74	1975-80
Urban	18.8-19.6	19.2-20.8	21.5	22.6	23.1	24.8
Rural	18 -18.5	18.4-19.0	19.3	19.6	20.3	22.1

3. The peak age for Chinese women at their first marriage was 17.4 in the 1940's, 17.9 in the 1950's, 18.8 in the 1960's and 21.5 in the 1970's. In 1970, the peak year of age at first marriage was between 19 and 20 years of age. This rose to 21 by 1975. After 1976, most women married between 22 and 23 and by 1980 the peak age for first marriage was 23. This demonstrates convincingly that family planning accelerates declines in fertility.

4. The Chinese late-marriage rate grew steadily and gradually until 1972. During the 1970's the late-marriage rate for the entire country was 16.3 percent. It rose very rapidly between 1973 and 1979. The late marriage rate for the women of the entire country jumped 5.2 percentage points annually to 52.9 percent in 1979.

This data shows that the age at marriage of Chinese women spontaneously rose as social conditions changed. Age at first marriage began to rise rapidly from the middle of the 1970's when China began to carry out family planning effectively.

B. Fertility. Since liberation a social environment favoring fertility decline appeared and a spontaneous decline in fertility become possible. The 1/1000th fertility sampling survey demonstrates this. Overall fertility in the 1960's was 5.68, a decline from 5.87 in the 1950's. However, in this period China had three difficult years of abnormally declining fertility beginning in 1958 and falling more rapidly between 1959 and 1961. A compensatory sharp increase in fertility beginning in 1962 and 1963 lasted for 3 or 4 years. Thus data examined in 10-year periods will show large disturbances. If we compare fertility by eliminating these abnormalities we find that fertility from 1952 to 1957 was 6.22 and from 1967 to 1970 it was 5.96. From 1971 to 1975 fertility declined sharply to 4.54. If we compare the overall fertility in 1952, just after land reform, with overall fertility during 2 years at the close of the 1960's we can see more easily the spontaneous decline in fertility and the role of family planning in accelerating this decline. (see table below)

In addition, comparing fertility by age cohort for the years 1964, 1970 and 1981 we can see that although in 1970 all age cohorts had slight declines in fertility, once the 1970's began fertility declined rapidly. See the data below:

	China	Urban	Rural
1952	6.5	5.5	6.7
1969	5.7	3.3	6.3
1979	2.7	1.4	3.0
1984	2.1	--	--

Year/Age	15-19	20-24	25-29	30-34	35-39	40-44	45-49	Total
1964	0.067	0.290	0.307	0.256	0.188	0.095	0.011	6.078
1970	0.042	0.273	0.304	0.254	0.178	0.079	0.011	5.703
1981	0.012	0.193	0.211	0.068	0.031	0.012	0.003	2.652

C. The Pattern of Fertility: The history of demographic changes demonstrates that spontaneous changes in fertility began with late marriage, giving birth late, and giving birth to the last child at an earlier age. Only later does fertility in the peak ages for giving birth decline rapidly.

1. In the latter half of the 1960's the fertility of Chinese women in the cohorts aged 15 to 19, 40 to 44, and 45 to 49 was lower than in the first half of the 1960's and lower than it was during the 1950's. This demonstrates clearly that fertility had begun to decline spontaneously. These three age cohorts began large fertility declines around 1973, clearly demonstrating thereby the role of family planning in accelerating declines in fertility in these three age cohorts.

2. By 1970, the number of urban women who had given birth to three or more children had fallen by more than one-half, bringing down the national average of women who had three children and three or more children to 62.2 percent. However, the effective implementation of family planning accelerated the decline in the proportion of women who had more than one child to 44.6 percent in 1977, 28 percent in 1981 and 19 percent in 1984.

3. In 1979, China put forth the call "only one child per couple" but even before this some Chinese women wanted just one child. Furthermore the proportion of those who wanted one or two children increased. This can be seen from the number of surviving children of women in different age groups and from the 1982 population census.

The Percentage of Women With 1, 2 or 3 or More Children by Age Cohort of Women in 1982

1981 Census Cohort	1979 Cohort	1 Living Child %	2 Living Children %	3 or More Living Children %
1) 30-39	28-36	8.8	28.2	63
2) 40-49	37-46	2.7	8.1	89.2
3) 50-59	50-56	5.6	8.3	86.1

Women in these age cohorts by 1979 were already beyond their most fertile years. Comparing these age cohorts revealed that cohorts 1 and 2 had children during the 1950's or the beginning of the 1960's and that cohort 3 had children in the early 1950's or before liberation. The proportion of women in cohort 1 with two children is clearly greater than the proportion in cohorts 2 and 3. This shows that women had voluntarily begun to reduce their fertility. Since having just one child was promoted in 1979, the proportion of couples having just one child has risen very sharply. In 1977, first births accounted for 30.9 percent of all the infants born in China, climbing to 46.6 percent in 1981 and 56.5 percent in 1983. (Footnote 2) (Data from the State Family Planning Commission)

D. Regional Differences in Changes in Fertility: European experience of demographic change shows that in countries with uneven economic development demographic change begins with one segment of the population and spreads from there to the entire population. Nearly always fertility declines first in the cities and then low fertility spreads to neighboring areas and areas with a cultural level similar to that of the cities and finally to the entire country. China's urban fertility began to decline fairly quickly around 1965. From 1952 to 1957 overall fertility in the cities and townships was 5.6. By 1965 to 1970 fertility had declined to 3.4. Shanghai was the first to show a drop in fertility. Shanghai's overall fertility according to the 1/1000 fertility sampling survey was 4.75 in the 1950's and 2.83 in the 1960's. The decline in Shanghai's fertility began as early as the latter of the 1950's. Fertility in Jiangsu Province, neighboring on Shanghai, and Liaoning Province, the province with the highest proportion of its population in cities and townships, declined spontaneously from the latter half of the 1960's. Fertility in Shanghai, Jiangsu Province, and Liaoning Province declined more rapidly once family planning was vigorously developed. By 1981, overall fertility in Shanghai had fallen to 1.32 and in Liaoning Province to 1.77, making fertility in Liaoning Province fall from among the highest among China's provinces to the lowest. By 1981, fertility in Jiangsu Province had fallen to 2.08, the replacement level. According to information released by the Jiangsu Province Family Planning Committee overall fertility had fallen to 1.4 in 1984.

Fertility in areas neighboring on provinces and core areas of Beijing, Tianjin, Shanghai, Liaoning, and Jiangsu, such as the three provinces of the northeast, Zhejiang, and Shandong also gradually declined.

III. The Social Conditions Favorable to the Development of Family Planning in China

Today more people throughout the world recognize that in reducing fertility there is a great difference between having a family planning policy and not having a family planning policy. Some scholars even believe that family planning policy alone can make fertility decline. Practice demonstrates that some countries have carried out very effective family planning programs while some other countries have not had effective programs. For example, India in 1952 set and implemented a family planning policy but it was not very effective compared to the family planning programs carried out much later by Thailand and Indonesia. The differences between these programs involve the social conditions for carrying out family planning and the way family planning work is carried out.

There are some abroad who are confused by or cannot explain the rapid decline in fertility after China carried out family planning. Some who misunderstand believe that China relied on force to carry out its family planning program. They are unable to understand that China's socialist system has opened up a new way to family planning which foreigners are unable to do when they carry out family planning.

First, all the nationalities of the entire country agree on the population problem and on family planning. This is fundamentally different from foreign countries where political parties attack one another on the questions of population and family planning in order to gain partisan advantage. The leaders of many countries conceal their own views on family planning so that these views cannot be used against them by their political opponents. People never speak sincerely on family planning because social forces openly oppose it.

History shows that family planning has not spread quickly in the past because churches, physicians, and some organizations openly opposed it. Dissemination of birth control information was not legalized. Even today some countries have not entirely shaken off these influences.

China recognizes that family planning is the path that mankind must take and so does not conceal its viewpoint on this matter. We have legalized family planning and openly proclaimed that it is a fundamental national policy. Laws and the constitution stipulate clearly that family planning is the right and the duty of every citizen. China has made family planning one of the components of spiritual culture. These are important conditions for China's implementation of family planning.

Second, the planned national economy under China's socialist system made China's family planning take a broad macroscopic perspective. This is different from the microscopic view of the West which considers only the family and the couple. Family planning at the level of the family is unrealistic from the macroscopic perspective. By taking the macroscopic perspective, the demands of the state as well as the wishes of the individual and the family can be combined. Family planning obtains the leadership of the state and proceeds in a planned, gradual manner. Moreover from this strategic height the problems of the quality, distribution, structure, and aging of the population can be considered together with society, the economy, the ecological environment, and the technological revolution. Giving the goals of national development and population control to the masses and making them realize that the demands of national development will require higher quality rather than more quantity in the population will make family planning work part of their conscious behavior.

Third, under socialism carrying out family planning work is part of the work of all the people. A government department takes responsibility for overall coordination. Other departments, such as the medicine and health department, the department in charge of the production and distribution of birth control medicine and equipment, the education and research department, the household registry department, the statistical department, the treasury department, the propaganda department, etc., all assume some responsibility as well. Each social organization, such as labor unions, women's organizations, youth organizations, etc., coordinate their activities, becoming an integrated force carrying out comprehensive measures and mobilizing government and mass family planning organizations. This arrangement can scarcely be compared to the "one-man shows" of private and semigovernmental organizations promoting family planning in many countries.

Furnishing birth control medicines, equipment and techniques free of charge is a very important part of promoting family planning. Only a socialist country with public ownership of the means of production could supply a reproductive age population of nearly 500 million people free of charge. In some developed countries, for various reasons appropriating funds for birth control medicine, equipment, and medical operations as well as for different kinds of subsidies is difficult.

Fourth, in Chinese society there are organizations at every level and grass-roots organizations form a very efficient system for disseminating information which permits family planning propaganda and free birth control medicine and equipment as well as medical operations to reach the people without any obstacles. Moreover, this same system easily feeds back information to the guiding department of the state so that family planning can master the situation in a timely manner, discover shortcomings, rectify errors promptly, and guide different areas differently according to regional peculiarities and make family planning proceed smoothly in China.

Changes in China's social environment made a change in views on reproduction a possibility. The development of family planning made this possible change in fertility a reality. Family planning policy can play a very large role in accelerating the decline of fertility only if this policy first reflects the characteristics and requirements of this demographic change. If it does not accurately reflect these changes it cannot induce a decline in fertility or will cause a merely temporary decline. Therefore, family planning must be continually examined in the light of practice and continually adjusted and improved as it is being carried out in order to adapt it to new situations.

In carrying out family planning or in implementing a population policy we cannot understand it as simply another way of saying we are aiming at achieving a certain population target or reducing the number of births. It must have a rich and profound content including the ideology that guides it and the methods it uses to achieve its goal. Some foreigners think of China's population policy as "the one-child policy." This is a very lopsided view because China's population policy includes many policies for different situations in different regions, for different nationalities, in different periods of time in addition to the policy of raising the quality of the population. In order to thoroughly implement China's family planning policy we must further stress the policy of combining the leadership of the state with the desires of the individual. Persuading people through education is an indispensable part of family planning work. In addition, we must pay strict attention to efficiency in the supply of birth control techniques and of medical services.

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ELECTRIC POWER OUTPUT PLANS FOR SEVENTH FYP OUTLINED

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 26 Feb 86 p 1

[Article by Liu Bianyang [0491 6239 7122] and Zhang Heping [1728 0149 1627]]

[Text] In a Beijing meeting, electric power department heads reported that to reverse critical electric power shortages, China's annual average electric power generation capacity for large and medium-sized power generation equipment going into operation during the Seventh Five-Year Plan will be about 7 million kW. This is more than double the 3.23 million kW of the Sixth Five-Year Plan.

According to this plan, by 1990, nationwide electric power generation will reach 550 billion kWh, an increase of 142.7 billion kWh, over 1985 and representing an average annual increase of 6.2 percent. Total investment in electric power construction will be 58.6 billion yuan; 34.4 million kW of electric power generating capacity will be put into operation. The scope of power plant construction will be 54.9 million kW.

It is reported that China's electric power construction plan for the next 5 years is as follows:

Active development of thermal power, mainly in Shanxi, Inner Mongolia, Heilongjiang, Henan, Shaanxi, Ningxia, Shandong, Anhui, and Guizhou--all major coal-producing regions. We will build a number of power plants in these mineral-rich areas. In coastal areas, we will build harbor power plants.

Vigorous development of hydropower with continued development of the upper reaches of the Huang He, the tributaries of the middle and upper reaches of the Chang Jiang, and the hydropower resources of the Hongshui He basin by building a group of hydropower stations. The hydropower resources in northeast and east China make them good areas for construction of medium-sized hydropower stations. We will also help localities develop medium and small-sized hydropower stations.

We must concentrate on gradually developing nuclear power, complete the first phase of Zhejiang's Qinshan nuclear power plant project, and carry out preliminary work for the second phase of the project, and continue construction of the Guangdong nuclear power plant.

We should actively develop power networks throughout the northeast, the west, the east, central, and south, progressively completing a 500 kV central network. Also, finish construction of the Gezhouba-to-Shanghai 500 kV direct current transmission project and link up the central China and east China grids. A responsible spokesman for the Ministry of Water Resources and Electric Power emphatically pointed out that during the Seventh Five-Year Plan increases in the output value of agriculture and industry can remain only as high as increases in electric power production. If the pace of production quickens, the demand for electricity for daily living will skyrocket. Then, after the Seventh Five-Year Plan, we will have a power shortage that may not be alleviated and in fact it may even worsen. How to solve our critical power shortage will require in-depth research.

NATIONAL POLICY

BRIGHT PROSPECTS FOR INVESTMENT IN ENERGY DEVELOPMENT

Hong Kong JINGJI DAOBAO [ECONOMIC REPORTER] in Chinese 10 Mar 86 p 28

[Text] During its Seventh Five-Year Plan (1986-1990), China will energetically develop hydropower resources; electric power will be a major construction item.

Grand Plan for Hydropower Development

The emphasis on China's development of hydropower is on the middle and upper reaches of the Chang Jiang, the upper reaches of the Huang He, and the Hongshui He basin, as well as preparatory development of the hydroelectric resources of the cascades of the Wu Jiang, Yalong Jiang, Dadu He, Jinsha Jiang, and Lancang Jiang.

For many years, the Chinese have eagerly anticipated the present preparatory work on the Sanxia [Three Gorges] hydropower station on the Chang Jiang. This huge engineering project has benefits of flood control, electric power generation, river transportation, etc., and will have an installed capacity of 13,000 megawatts. It will be the world's largest hydroelectric station.

The Three Gorges hydropower station is planned for completion in the 1990's. It is reported that the Three Gorges Plan Science Center building has been completed. A 40-kilometer highway connecting the Gezhouba and Three Gorges dam site is now under construction. It is projected that construction of a 150-meter-high concrete dam will begin in 1986.

Guangxi's Hongshui He is rich in hydropower resources. The Hongshi He can yield 11.1 million kilowatts of electric power. Besides the Lubuge, Tianshengqiao, Yantan, and Dahua hydroelectric stations, which are already under construction, additional stations such as Longtan, Datengxia, and Etan are being considered for development. This is a total of 10.2 million kW of electricity.

Increasing the Electric Power Supply for Coastal Cities

In the next 5 years, China will increase electric power related construction in the coastal port cities; a number of thermal power plants will be built and total installed capacity will reach 18.75 million kilowatts. This year it is hoped to put into operation a capacity of 3.6 million kilowatts.

Dalian, Nantong, Fuzhou, and Guangzhou will use foreign investment to import advanced equipment and build a batch of thermal power plants. The State Council passed approval for the Huaneng International Electric Power Development Company to set up negotiations with Japan, France, and the Federal Republic of Germany. Importation of electric power items are the main business. Qingdao and Yentai cities will cooperate with central and local entities to build power plants.

Additionally, the development of nuclear power plants in the coastal areas is one of the measures being taken to develop the electric power industry. From the start of the Seventh Five-Year Plan, within 15 years a batch of nuclear power plants will be built in places deficient in power resources like Guangdong, East China, and the Northeast. As of now, the Daya Bay nuclear power plant in Guangdong and the Qinshan nuclear power plant in Zhejiang are already under construction.

As China's major hydroelectric and coal resources are concentrated in the southwest, northwest, and northwest Huabei, while most electric power consumption is concentrated in the southeast coastal region, the Chinese Government has decided to develop long-distance, high-voltage power transmission lines. A few major power lines now under construction or in the planning stage are as follows. Already under construction in Anhui Province is the Huainan-to-Shanghai 500 kV line which can provide Shanghai with 1 million kW of power a year. A 500 kV transmission/transformer project will link Guangxi and Guangzhou provinces and stations on the Hongshui He will make 600 to 700 megawatts of power a year available to Guangzhou.

The state has also decided to exploit the upper reaches of the Huang He, which is rich in hydropower resources, to send power to northern China to support developed coastal cities like Tianjin. In the Chang Jiang river basis, China's largest hydroelectric station, the Gezhouba power station, will construct China's first two phase, 500 kV direct current power transmission line to Changhai. After completion, this line will make 1.2 million kilowatts available to Shanghai. After the construction of these super high voltage power transmission lines, the cities of Zhanjiang, Beihai, Ningbo, Wenzhou, etc., will all benefit.

China-Foreign Cooperation Already on Large Scale

Due to the rapid development of hydropower resources and faster electric power construction, Vice Premier Li Peng has welcomed international investment and cooperation. According to reports, the U.S. Government has announced that it will help China to plan construction of the world's largest hydropower station at the Three Gorges. U.S. specialists are already visiting China and assisting in planning. As a result of bidding both within and outside China, the Taisei Company of Japan was awarded the bid and has already started construction of the Lubuge power station on the Hongshui He. Also, the World

Bank has lent China U.S. 145 million. A special international advisory group including Australia's Snowy Mountain Company and Norwegian experts is also providing consultation. Guangzhou is already building two power facilities in joint ventures with foreign businesses.

With the use of foreign capital and advanced equipment, nuclear power plants can be built. The Chinese Government has already made nuclear power cooperation agreements with Great Britain, the Federal Republic of Germany, and the United States.

MEASURES SOUGHT TO HEAD OFF EXPECTED RURAL ENERGY SHORTAGE

HK200319 Beijing CHINA DAILY in English 20 May p 3

[Report by staff reporter Hu Sigang]

[Text] Rural areas face a severe energy shortage in the 1990s, unless urgent measures to tackle the potential crisis are put into operation.

With the development of local industry and improvement of farmers' living standards, the demand for energy is skyrocketing, according to a senior official of the Ministry of Agriculture, Animal Husbandry and Fishery.

If no effective measures are taken to match supply with demand, rural economic development and the ecological balance could be seriously affected, he warned. "in this situation, two avenues are open to us," he said. "One is to exploit local energy resources and the other is to develop energy-saving techniques."

By 1990, the rural production sector will need energy equivalent to at least 170 million tons of standard coal a year while farmers will need 60 million tons for domestic use. But the state will only be able to provide energy equivalent to 190 million tons of coal, according to the official.

However, China has already mapped out measures to ease the energy shortage.

During the Seventh 5-Year Plan period (1986-1990), 3.25 million kilowatts of electricity will be generated a year by small hydropower stations scattered around the country; 60 million hectares of new forests for fuel will be planted; 70 million more fuel-saving stoves will be distributed and another 2.5 million farm families will use biogas (methane) for cooking, according to the official.

In areas with abundant natural energy resources but little electricity, power stations generating 5,000 kilowatts a year will be installed fuelled by biogas.

Some 250,000 solar stoves will be introduced along with solar heating equipment and 50 more geothermal energy projects will be started. The ministry plans to cooperate with other ministries to further develop wind and wave power and means to save 30 million tons of standard coal a year should be devised by the end of 1990.

"By then, 4 percent of the rural population will use quality gas fuel and 60 percent will use clean and convenient fuel-saving stoves," he said. Great changes would surely take place in the rural energy situation if the goals were all realized, he said.

The official said the outline plan for rural energy development was feasible. "But the task in front of us is an arduous one."

Leaders of all localities and farmers have been urged to increase their efforts to bridge the energy gap by developing new techniques and exploiting new resources.

At the moment, most farmers still consume energy in relatively primitive ways. Waste is high. People mainly burn straw and plant stalks; in 1985, 200 million tons of straw and stalks were burnt. As a result, nitrogen and phosphorus amounting to 60 percent of the country's total fertilizer output was lost. And green coverage has been reduced from 12.7 percent in 1976 to the present 12 percent owing to tree felling for fuel.

The official said that the central government was very concerned with energy development in rural areas. Special offices have been set up in the State Council, the State Economic Commission, the State Planning Commission, the State Science and Technology Commission, and several ministries to supervise the rural energy development.

BRIEFS

EXPANSION IN SEVENTH FYP--Beijing, 12 May (XINHUA)--China plans to construct power plants with generating capacities of 60 million to 65 million kilowatts during its Seventh Five-Year Plan period (1986-90). Officials of the Ministry of Water Resources and Electric Power told XINHUA today half of an unspecified total number of plants will be completed during the period, and an additional capacity of up to 7 million kilowatts is now expected every year. Already four giant hydroelectric stations--Lubuge, Tianshengqiao, Yantan, and Dahua--are well under way on the Hongshui [He], along with another dozen power facilities, including two nuclear ones. POWER NETWORK

SICHUAN TO ADD 2.28 MILLION KW IN CAPACITY IN SEVENTH FYP

OW162105 Beijing XINHUA in English 1917 GMT 16 Apr 86

[Text] Chengdu, 16 Apr (XINHUA)--Sichuan Province plans to build a big power plant and a hydropower station to meet the needs of its fast economic development.

Some 2.28 million kW of power-generation capacity will be added to this most populous province during the 1986-1990 period, according to local officials.

The province is still short of electricity though it has produced an annual 16 billion kWh of electricity over the past few years.

By 1990, the province will be able to annually generate 25 billion kWh of electricity, a 56 percent increase over 1985.

The thermal power plant, to be built in the northern part of the province, has a design generating capacity of 900,000 kW, which involves a total investment of 1 billion yuan.

Two generating units of 335,000 kW each will be imported from France. One of them is expected to go into operation by 1989.

Construction of a hydropower station with a generating capacity of 3 million kW will start next year in the southwestern part of the province. The station, with a total investment of 3.2 billion yuan, is to be completed in 10 years. Upon completion, it will be able to produce 16.5 billion kWh of electricity a year--equal to the present total electric energy production of the province.

The money needed for the construction will both come from the state and be pooled among localities.

POWER NETWORK

NORTHWEST TO SEE BIG GROWTH DURING SEVENTH 5-YEAR PLAN

HK210452 Xi'an Shaanxi Provincial Service in Mandarin 0030 GMT 18 Apr 86

/Text/ During the Seventh 5-Year Plan period, China will vigorously develop its northwest electric power industry. It will increase the installed capacity there by more than 200 percent compared to that of the Sixth 5-Year Plan.

During the Seventh 5-Year Plan period, China will move to the west a number of enterprises which consume large amounts of electricity. Therefore, the power consumption of northwest China will annually increase by more than 10 percent. In order to meet this situation, the northwest will make full use of such advantages as coal and water resources to greatly develop the power industry.

During the Seventh 5-Year Plan period, the northwest electric power industry will continue to simultaneously develop hydroelectric and thermal power generation; large, medium-sized, and small power stations; and state-run and local power stations.

In hydroelectric power generation, the Longyangxia and Ankang hydroelectric power stations will be put into operation. Construction will start on the Lujiaxia and (Daxia) hydroelectric stations on the upper reaches of the Huang He.

In thermal power generation, a number of power stations will be built and expanded. Output capacity will be increased by 2.2 million kilowatts.

At the same time, the region will build a number of power transmission projects serving these power stations so as to promptly achieve the goal of linking the power grid in northwest China with that in north China.

BIG GEZHOUBA TRANSFORMER READY FOR TRIAL OPERATION

OW281344 Beijing XINHUA in English 1325 GMT 28 Apr 86

[Text] Wuhan, 28 Apr (XINHUA)--A 500,000-volt transformer station, China's biggest, will soon be put into trial operation at the Gezhouba hydroelectric project complex in Hubei Province, XINHUA learned today.

This will pave the way for the transmission of electricity from the Gezhouba complex to central and eastern China. When completed, Gezhouba will have a total generating capacity of 2,715,000 kilowatts.

The first stage of the scheme, with a capacity of 965,000 kilowatts, has generated 25.45 billion kilowatt-hours of electricity since it went on stream at the end of 1981.

This year, two generating units of the second stage, with a combined capacity of 250,000 kilowatts, will go into operation.

STRICT CONSUMPTION QUOTAS URGED FOR QINGHAI POWER USERS

HK270830 Xining Qinghai Provincial Service in Mandarin 2230 GMT 23 May 86

[Text] In order to ease the shortage of power in the fourth quarter, the storage season at Longyangxia Reservoir, and to ensure the fulfillment of this year's industrial production tasks, the provincial finance and economic commission held a work meeting between 20 and 22 May on the planned consumption of electricity. The meeting urged the departments in charge of electricity to rationally set up power consumption quotas for consumers. They should not excessively distribute and consume electricity when the power network has shortages. We should take economic measures against those consumers who do not consume power according to the assigned quota and who hide the fact from others. All departments should balance in a comprehensive way their electricity load. At the end of the third quarter, the industrial enterprises should have fulfilled 80 percent of the annual production quota. Enterprises will be given electricity in connection with their economic results.

The meeting also urged the consumers to save electricity. Beginning with technology and management, the enterprises should strive to reduce their amount of power consumption.

BRIEFS

NEW ZHEJIANG PROJECTS--As revealed at Zhejiang's power industry work conference on 14 March, three new power-generating units totaling 300 MW will be put into operation in the province this year. Other provincial electric power projects expected to be completed within the year include four power transmission lines of more than 220 kV and five transformer stations. In addition, work is being stepped up to have the Zhoushan direct-current power transmission project completed this year. This project, designed by Chinese engineers and using domestically made equipment, is the first of its kind in China. HYDROPOWER

CRITICS, PROPONENTS OF THREE GORGES PROJECT AIR VIEWS

HK260839 Hong Kong PAI HSING in Chinese No 118, 16 Apr 86 pp 28-30

[Article by Jung Chou [2837 3166]: "Heated Debates About the Hydroelectric Power Station Across Chang Jiang's Three Gorges"]

[Excerpts] Debate over the hydroelectric power station project across Chang Jiang's three gorges has been going on since it was first proposed. In a meeting with U.S. Energy Secretary John Herrington on 14 March, Zhao Ziyang said: "The Three Gorges project will be the largest of its kind and it has caught the world's attention. The Chinese Government has done voluminous preparatory work on it, however, some economic and technological problems need to be further explored." Obviously, it is final that the construction of this project undergoing long preparations will get under way. However, this does not mean that debate among different views will be over. That is why Zhao Ziyang said some problems "need to be further explored."

It has been learned that this project was given the go-ahead by the highest CPC authorities back in 1984. When the State Council gave its approval in principle to the "Report on the Feasibility Studies of the Chang Jiang Three Gorges Water Control Project," it was decided that a Three Gorges project construction preparatory headquarters be set up by the Gezhouba Project Bureau, which is known for its abundant building eqiupment and technological and human resources. A number of construction workers were to be sent with the headquarters to settle at the confluence of Letian Brook at Sandouping, 40 km upstream from Gezhouba. On 15 November 1984, Vice Premier Li Peng made a formal announcement to start "preparations for the development of the Chang Jiang Three Gorges Hydropower Station Project, which will have a total capacity of 13 million kW, with each generator set exceeding a capacity of 500,000 kW." This announcement was made at a meeting marking the 50th anniversary of the founding of China's Electrical Engineering Society in the Great Hall of the People. In coordination with the construction of the project. China planned to merge Xanxian and Peiling, Sichuan and some counties and cities in Yichang and Enshi, Hubei into a new province, "Sanxia", and Li Boning, former vice minister of water resources and electric power, was appointed leader of the preparatory group of the new province.

As the Three Gorges Hydroelectric Power Station is a megaproject involving enormous financial, material, and human resources, its success or failure is of great importance. In view of the lessons drawn from the hasty decision on building the Baoshan Iron and Steel Works in Shanghai, a number of luminaries experts, and scholars have put forth many proposals and questions. The CPPCC thus sent an investigation team headed by 90-year-old Sun Yueqi to make an on-site survey of the Three Gorges on the Chang Jiang. Later, a problem-laden survey report was submitted. Since then, relevant debate has spread both at home and abroad. The author has close friends among the famous water conservancy and electric power experts and has learned from them some inside stories concerning the project. Following are some issues of universal concern, to be recorded here for the reference of the reader.

Comprehensive Economic Results

It has been disclosed that the Three Gorges Hydropower Station is a mammoth project that will bring comprehensive economic results in flood prevention, irrigation, power generation, navigation, and aquaculture.

China has for the past 3 decades and more expended a huge amount of financial and human resources on preventing floods and on dealing with emergencies every year, with staggering accumulative figures. If a great flood should recur, it would be dreadful to contemplate a break in the Xing Jiang dykes. Living now in the flood-diversion region is a population of 400,000. Even if the flood-diversion gates were open, the direct losses incurred would be more than 20 billion yuan, which exceeds the budget for the Three Gorges dam in design. Involved experts believe that the building of the Three Gorges project is the only way to relive the threat of floods to millions of people on the banks of the Xing Jiang, as the project will efficiently control 95 percent of the source of floods in this region.

The annual output of the Three Gorges Hydropower Station will be more than 65 billion kW/hr, which would consume more than 35 million tons of raw coal or 18 million tons of oil for ordinary thermal power plants. In addition, it will be pollution-free and free of the heavy demand on transportation of fuel and minerals, as well as dealing with waste and ash. At the same time, it will help correct the shortcomings of the Chang Jiang's imbalanced distribution of power resources along its river valleys and satisfy the energy-starved industrially developed zones in its middle and lower reaches. Moreover, the Three Gorges Reservoir will serve to regulate the water flow, which will help raise the generating capacity of the Gezhouba hydropower station from 760,000 kW to 1.5 million kW. Experts believe that the building of the Three Gorges hydropower station will be one of the decisive factors in the rapid economic development of the mainland.

Tremendous Investment Involved

As reported in a Hong Kong newspaper, the Three Gorges Project involves an estimated investment of 60 billion yuan, which is quite beyond China's means. Some people believe that the project will eat up more than $20 billion worth of foreign currency and land the nation heavily in debt, when the loss will definitely outweigh the gain. A friend of the author questioned an export of the "Chang Jiang Navigation and Water Conservancy Development Committee" and learned that the total investment in the budgetary estimate for the project would be 16 billion yuan, including $1 billion worth of foreign currency. The whole lot would be spent in 17 years, and the average annual investment would be 1 billion yuan, which is within the means of the nation. Besides, the completed Gezhouba Project will be a leading component of the Three Gorges Water Control Project; it will bring in about 500 million yuan from its output; and when all its 21 generator sets are tied into the power network, its income will more than double. After the Three Gorges Project has been under way 8 years, two generator sets with a capacity of 1 million kW will have been put into production. From then on, four generator sets will be put into production on an annual basis, so the Three Gorges Project will be able to solve its investment on its own.

Some people hold the view that refraining from or putting off the building of the Three Gorges Project and building another 20 large and medium hydropower stations in its stead, will involve less investment but bring about quick results. In fact, only 6 initial designs of these 20 hydropower stations in the proposal have been submitted; the rest are still castles in the air. It is impossible to break ground in the near future. Moreover, efforts can be concentrated when building the Three Gorges Project; with the huge volume of work involved in installing the generator sets, overlapping expenditures in building and waste in human and financial resources may be avoided. The investment to install the generator sets averages 1,200 yuan per 1,000 kW, which is much lower than the average investment on projects in mainland China today. The Three Gorges hydropower station will span the Chang Jiang. The effective utilization time will be 5,200 hours a year or 3,000 hours more than the 20 projects that would replace it. Its output will be more than 30 percent greater than the 20 projects put together. Even the acreage to be covered by water will be 50 percent less and the number of people to be evacuated will be 30 percent less. It is difficult to estimate the normous role of the Three Gorges Project in the economic development in East and Central China after the 1990's.

Discussion on "damage to the ecological balance" has spread since the building of Gezhouba. Some say the dam has raised the water level, submerged a large area of land, and even more seriously increased the alkalinity of a large area of land in the vicinity. Some say the dam has upset the natural habitat of aquatic animals in the river; affected most is the Chinese sturgeon, a "living fossil". Others say the dam has blocked the silt in the river, which may lead to a phenomenon similar to the Aswan Dam in Egypt which has caused seawater to erode the original fertile farmland on the Nile River Delta. Still others worry that Shanghai, situated on the estuary of the Chang Jiang, will gradually be swallowed by the sea. Besides, the dam has blocked organic sediment, which will result in a drastic drop in aquatic products at the Chang Jiang estuary. According to Sun Heian, deputy director of the Gezhouba Project Bureau and chief coordinator of the Three Gorges Project Preparatory Headquarters, there is some truth to these objections but they are views based on superficial knowledge. Over thousands of years, disastrous floods often took place along the Chang Jiang, and the environment for human subsistence has often been gravely threatened. Today, when we are trying to tame this "mustang" turning the harmful into the useful, why should we be unhappy about it? With the water level raised after the building of the dam, the water conservancy and irrigation of farmland will be markedly improved, and farming and production in the vicinity will inevitably undergo relative changes in development; it is not fair to single out the alkalinity of the soil.

The Gezhouba Dam has sand-washing sluices with a maximum flow at 10,000 cubic meters per second, which is capable of washing away the silt from upstream. Needless to say, a large amount of organic sediment is contained in the silt. The Three Gorges dam will have larger silt-washing sluices, so it is groundless to say the estuary of the Chang Jiang and Shanghai will be threatened.

Some people have asserted that with the building of Gezhouba, the Chinese sturgeon will be doomed to extinction. They wrote the CPC Central Committee and the State Council, demanding protection of the ecological balance of the Chang Jiang. Responsible people of several academic societies published an appeal for "saving the Chinese sturgeon." To deal with this, the CPC designated Du Rensheng, director of the Rural Policy Research Center of the Secretariat to organize a conference on the issue. Wu Xianwen and Ni Shuda, respectively director and deputy director of the Institute of Hydrobiology under the Chinese Academy of Sciences; Cao Wenxuan, research fellow; and Yu Jitang, engineer of the same institute; Ke Xuntao, director of Sichuan Institute of Aquatic Products; and professor Yang Bolu, dean of the Aquatic Products Department, Central China Agricultural College, share the view that the Chinese sturgeon will not be threatened by extinction and that it has the ability to adapt to a new environment.

The Siltation Problem

Whether the Three Gorges Project will lead to siltation is still another focus of discussion and target of attack. Some people believe that the project will bring about siltation, which will eventually turn Chongqing into a dead port. Tang Richang, senior engineer and deputy director of the Siltation Specialty Committee under the Water Conservancy Academic Society has been deputy chief engineer of the Chang Jiang Water Conservancy and Hydroelectric Power Institute for years. According to him, Chang Jiang differs greatly from Huang He. It has better vegetation of grass and trees on its upper reaches than the Huang He, and it is free of loess plateau effects. As a result, its water contains comparatively little silt. Based on the record of Yichang Hydrologic Station, every cubic meter of the water there contains a little more than 1 kg of silt on average -- 10.5 kg when the water is most turbid -- which is, on an average annual basis, only one-thirtieth of the amount of silt contained in the water of the Huang He at the Xiaxian Hydrologic Station. The Chang Jiang has a huge volume of water and a rapid flow, which is 2,770 cubic meters at Yichang during the dry season, the same as the Huang He when its water is high. The silt in the Chang Jiang falls into two categories: pebble of bed load, and fine sand of suspended particles, according to record, the annual amount of pebble reaching Fengjie County at the upper mouth of the Three Gorges is 700,000 tons -- not much -- and it sinks to the river bed, moving at a very slow rate. When the Three Gorges reservoir is built, the water level will be raised more than 100 meters; it is unlikely that the pebble of bed load will get into the dam area. The amount of sand of suspended load reaching Yichang is 520 million tons. The fine sand is mixed with the water, and will settle only in still water. The water in the approach channel of the Gezhouba is still, creating a sediment problem. But sand washing sluices are built along the channel, which turn the still water into rapids and will basically wash the sand away. The silt close to the fringe of the channel can be removed by dredger.

According to Tang, the real threat will be the backwater area at the tail of the Three Gorges reservoir. Calculating on the basis of the present plan, the dam has a normal water retaining level of 150 meters; the reservoir has its tail in Changshou County, miles east of Chongqing. But the water level will be regulated and changed according to the needs of power generation, flood prevention, and water storage. Here, the rapid water in the river will be decelerated suddenly and form backwater, which in turn will cause siltation. And that is where the idea that Chongqing will become a "dead port" comes in.

To cope with this problem, relevant departments have sent large numbers of scientists and engineers to particpate in research, using electronic computers for calculation, and silt-washing experiments with large-scale physical models in Beijing, Tianjin, Wuchang, and Hankou. Results show that the silt formed in the backwater areas during the high water season can be carried away by the river after floods. But should a windy and sandy season directly follow a dry season, siltation will occur between Changshou and Zhongxian, where shoals are many, and the water has a depth of only 3 meters, obstructing the passage of large vessels. However, based on simulation studies, it will not involve too much work to dredge the silt in this section. Local dredging facilities can remove the silt formed in the backwater areas.

In fact, both the Chongqing city government and the Chang Jiang Navigation Bureau hope the Three Gorges Project will get under way as quickly as possible. Moreover, they hope that the water level of the dam will be raised from 150 to 180 meters above sea level, so that power output can be increased by a large margin and ships with a tonnage of 10,000 can reach Chongqing throughout the year.

The Service Life of the Dam

The Three Gorges dam will be 175 meters in height, equal to the Lonyangxia dam built earlier on the upper reaches of the Huang He, but lower than the Grande Dixence dam in Switzerland, which stands 285 meters high, and the

Rogun dam of the Soviet Union, which is 325 meters in height. Even so, some people still express doubt concerning the service life and the building technology of the Three Gorges dam, and worry about a possible earthquake in this region that would threaten the safety of the dam.

The PRC's Ministry of Geology and Mineral Resources was entrusted to convene a "Symposium on Geological Problems Concerning the Chang Jiang Three Gorges Project for experts and scholars in the summer of 1985. A comprehensive study was conducted on data derived from surface surveys, remote sensing, deep drilling detection, physical and chemical detection, topographic analyses, crystal stress tests, on-site experiments, and seismic monitoring. Finally, a team of experts was formed, consisting of more than 10 professors, research fellows, and senior engineers, which submitted the "Demonstration Report of the Symposium on Geological Issues of the Chang Jiang Three Gorges Project," affirming that "the dam's site at Sandouba is a sound one, suitable to building a dam with a water level between 150 and 180 meters." The report also gives concluding remarks on the studies of such important issues as the stability of the dam area, the possibility of an earthquake induced by the construction of the reservoir, the stability of the dyke along the reservoir, and the submergence and development of the mineral resources in the reservoir area.

A U.S. observation team recently made an on-site investigation in the Three Gorges area and would not buy the idea that Chinese experts think it all right -- barring a major earthquake in the area in the next century. They think it reliable to exclude the possibility of a major earthquake in the next [illegible],000 and 10,000 years. The rapid progress in modern science and technology will solve a greater number of more complicated problems in the future. Perhaps the Three Gorges Project is linked with China's economic reform and the future of its "well-to-do" living standard; therefore, they must be meticulous as well as resolute, attaching attention to both, which is an important issue testing the CPC authorities.

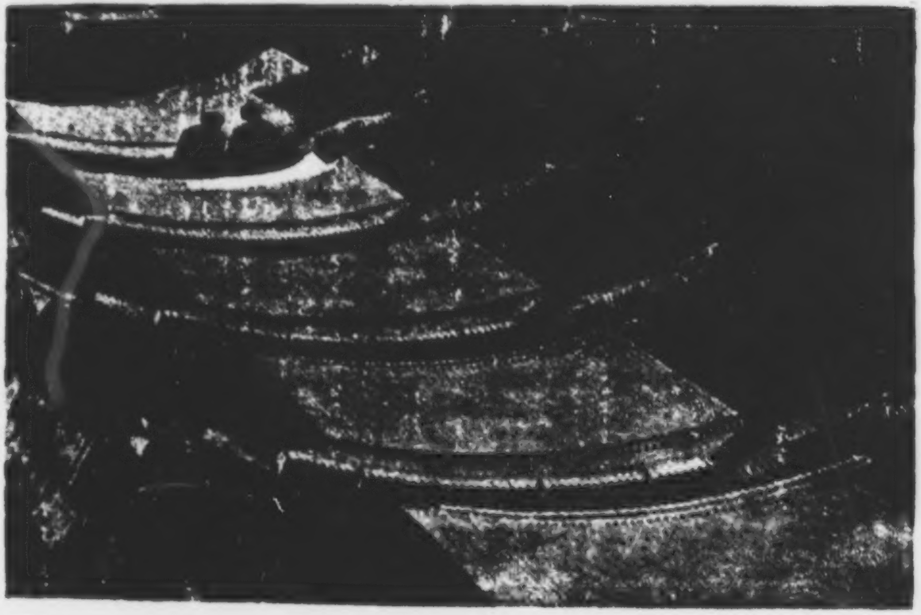
HYDROPOWER

SICHUAN PREPARES 320MW GENERATOR FOR LONGYANGXIA

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 17 Apr 86 p 4

[Photograph and caption]



In order to meet the need for large-scale power plants, the Dongfang Electrical Machinery Factory in Sichuan has fabricated a single-unit 320,000kW hydraulic turbine generator. This set is currently the largest of its kind to be made in China, and demonstrates that we have reached a new stage in designing and building heavy power generating equipment. The photograph shows the stator for the big hydraulic turbine destined for the Longyangxia hydropower station.

WORK ON HUGE MANWAN POWER STATION NOW FORMALLY UNDER WAY

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 2 May 86 p 1

[Text] Kunming, 1 May, (XINHUA SHE)--Construction of the Manwan hydroelectric power station officially got under way today. The station, located on the middle reaches of the Lancang Jiang in Yunnan Province, will have a total installed capacity of 1,500 megawatts.

The Manwan hydropower station will have six 250,000-kilowatt generators, the first of which will be producing electricity by the end of 1991. When completed, Manwan will be the biggest hydropower station in southwest China.

Yunnan Province has rich hydropower resources. Its six major river systems could support over 71 million kilowatts in installed capacity, putting it in second place nationally. The Lancang Jiang, upon which the Manwan station is located, is a major target for development in Yunnan Province. In initial surveys, the Kunming Survey and Planning Institute of the Ministry of Water Resources and Electric Power [determined that] on the more than 1,200 kilometers of the Lancang Jiang that flows through Yunnan, 15 cascade power stations could be built with a total installed capacity of 20.73 million kilowatts. The Manwan hydropower station will be the first station in this 15-cascade plan.

LOW WATER LEVELS EXACERBATE GUANGDONG'S POWER SHORTAGE

HK170308 Guangzhou Guangdong Provincial Service in Mandarin 0400 GMT 16 Apr 86

[Text] The provincial economic commission, planning commission, and electric power bureau yesterday afternoon held a report meeting on the situation in electric power to analyze the situation in power supply in our province and to put forward a countermeasure to improve the shortage. At the same time, the meeting emphatically pointed out: The situation in the power shortage in our province can hardly be basically improved in a short period of time. We must really enforce the State Council's provisional regulations on economizing on and controlling energy resources and do a good job in using power in a planned and economical way. Guangdong is one of the provinces in the whole country which are seriously short of power. In the first quarter of this year, due to the fact that the water level of the reservoirs dropped to the lowest level since 1975, hydroelectric power generation was affected. Although power departments tried in every possible way to increase output of thermal power and, at the same time, tried to purchase power from outside the province to increase the total power supplied in the first quarter by about 10 percent over the same period last year, supply still fell short of demand and the shortage of power was very marked. To improve the current situation in the short supply of power, departments concerned will take a series of measures:

1. Since output of hydroelectric power is now reduced, it is necessary to fully tap potentials to increase output of thermal power.

2. It is essential to rationally make arrangements for hydroelectric generating and to increase its utilization rate.

3. It is imperative to put into operation as soon as possible all generating sets imported to all places throughout the province last year. Moreover, the province should buy 500 million kilowatt-hours from Guangxi this year.

4. Watt-hour meters must be installed and electricity-consuming hours staggered. Economic levers must be used to encourage more enterprises to use power in the second half of a month so as to ensure a balance of generating electricity and the supply and use of electricity.

WU JIANG: RIVER RICH HYDROPOWER RESOURCE

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 12, 12 Dec 85, pp 5-7

[Article by Luo Xibei [5012 6007 0554], Zhao Yukun [6392 3022 2492], and Chen Zuan [7115 4371 1344]]

[Text] The Wu Jiang is the largest tributary on the right bank of the upper reaches of the Chang Jiang and stretches across Yunnan, Guizhou, Sichuan, and Hubei Provinces. The main stream flows through the Guizhou hinterland and merges with the Fuling in Sichuan Province at their confluence with the Chang Jiang. The river covers an area of 88,000 square kilometers which has great hydropower potential. Ranking seventh among the tributaries of the Chang Jiang in terms of area and third in terms of developable hydropower resources, it is one of China's biggest hydropower sources. Moreover, there are many conditions that favor hydropower development on the Wu Jiang, and acceleration of the pace of development is correspondingly important for energy resource planning and construction in China.

1. A River Rich in Hydropower Resources and With Favorable Natural Conditions

The climate along the Wu Jiang is warm with plentiful rainfall (900 - 1,400 mm annually), and the yearly discharge of 52 billion cubic meters is comparable to that of the Huang He. With an average annual depth of 600 mm, the Wu Jiang is also quite deep for tributaries on the upper reaches of the Chang Jiang. Its river valley is deep and drops steeply--according to statistics on the tri-river confluence, the mainstream is 1,037 kilometers long and has a drop of 2,100 meters, indicating a rich hydropower potential. According to data from the National Hydropower Resource Survey carried out in 1978-1980, the theoretical maximum power capacity of the entire Wu Jiang region is 10.426 million kilowatts (91.33 billion kWh per year), to which the mainstream contributes 56 percent (5.80 million kilowatts or 50.8 billion kWh per year). Preliminary development plans now call for a river project to consist of the following nine cascades: The Hongjiadu hydropower station on the Liuchong He "Spigot" cascade, followed by Dongfeng, Suofengying, Wujiangdu, Goupitan, Silin, Shatuo, Pengshui, and Wulong (or Daxikou). The large water head (nearly 1 kilometer) can be exploited to give an installed capacity of approximately 8 million kilowatts with a yearly output of nearly 40 billion kWh (Table 1 shows the results of preliminary calculations of the principal power-generation characteristics for each of the hydropower stations in the various stages: Of the large rivers flowing into the Chang Jiang with developable hydropower resources, the Wu Jiang is surpassed only by the Min Jiang's Dadu He and the Yalong He, which rank first and second.

Table 1. Characteristics of the Hydropower Stations on the Wu Jiang

Name of Station	Hongjiadu	Dongfeng	Suofengying	Wujiangdu	Goupitan	Silin	Shatuo	Pengshui	Daxikou	Total
Flow area (km^2)	9900	18161	21862	27790	43250	48558	54508	69920	86000	
Average yearly discharge (m^3/sec)	147	345	427	511	737	864	972	1320		
Water height at dam site (m)	978	834.7	758	624.4	437	364	292	211	150	
Planned water storage height (m)	1120	970	835	760	630	445	360	293	210	
Dead water height (m)	1070	936	813	720	570	430	340	278	205	
Total dam capacity below normal water storage height (100 million m^3)	30.97	8.64	1.57	21.4	56.9	13.8	6.2	13.8	8.47	161.75
Regulating reservoir capacity (10^8 m^3)	20.97	4.9	0.85	13.5	36.6	5.1	3.8	5.62	1.55	92.89
Regulatory capability	(a)	(b)	(c)	(a)	(a)	(b)	(b)	(b)	(c)	
Useful head (m)	142	135	75	130	185	81	68	82	60	958
Installed capacity (10 MW)	36	51	32	84	200	76	80	120	120	799
Guaranteed generating power (10MW)	13.2	22.2	14.1	36.84	73.76	28.7	31.8	42.4	32.8	295.8
Yearly output (10^{8}kWh)	13.36	30.0	19.38	46.72	87.7	38.4	39.5	66.11	58.8	399.97
Number of displaced people	12750	8018	52	10633	4540	8746	10100	17030	10660	82529
Arable land flooded	10170	8450	250	20930	7443	10134	7000	10141	8070	82588
Maximum dam height (m)	157	168	111	165	236	112	88.5	119		

Key: a) Year-round; b) Seasonal; c) Daily.

Notes: (1) Although the energy figures listed are related to the discharges, the regulatory effects of the Hongjiadu, which supplements the discharges at the other downstream stations, have been omitted; if included, the total guaranteed power would be much higher. (2) The flooding figures for Hongjiadu and Goupitan are currently under review. (3) The normal water storage height at Hongjiadu may be increased to 1,140 - 1,150 meters in order to enhance the regulation at the stations downstream.

2. Conditions Are Favorable for Reservoir Regulation With Little Flooding Losses

Regulated reservoirs are needed for the rational exploitation of hydropower resources and should be allowed for in development plans.

The results of numerous surveys and research carried out over a period of years went into the formulation of the preliminary draft for the nine-cascade river project; these results address the problem of building reservoirs of adequate size on as little arable land as possible so that as few people as possible are displaced. The advantage of this plan is that it calls for constructing a power station (the Hongjiadu) with a year-round regulable reservoir on the Beiyuan Liuchong He; a dam 140-160 meters high should suffice to form a reservoir with a capacity of 3.1 - 4.45 billion cubic meters which can be used to supplement and regulate the water supply of the downstream cascades. In this manner, excess water can be stored and released by the dam for use during the dry season, so that the power-generating stations downstream will be supplied with an adequate flow of water. In addition, a reservoir of capacity 5.69 billion cubic meters is planned for Goupitan on the middle reaches of the river, and it can also be used for regulation. Except for the Suofengying and Wulong (or Daxikou) cascades, which have only small reservoirs, all the other cascades are to have reservoirs large enough to regulate the flow through the respective stations. The total reservoir capacity of the nine hydropower cascades is to be 16-17.5 billion cubic meters, which amounts to 31-34 percent of the annual flow; this percentage is the same as for the stages used on the Hongshui He and should therefore permit effective regulation. Moreover, in its upper and middle reaches the main stream of the Wu Jiang flows through sparsely populated areas where there is little cultivation; furthermore, although the lower reaches pass near several large cities and towns (such as Sinan, Yanhe, Pengshui, etc.), the plans are designed to avoid flooding these heavily populated and cultivated areas. Preliminary surveys indicate that the nine cascades will flood only 80,000 mu and displace 80,000 people (even if one allows for underestimates of flooding in previous surveys of the Hongjiadu and Goupitan hydropower stations, the estimates for the flooded area and displaced population remain below 100,000 mu and 100,000 people respectively). Compared with the benefits of having a hydropower base with a total installed capacity of 8 million kilowatts, this is a relatively small price to pay--100 mu of flooded land and 100 displaced people for every 10 megawatts. These losses are far less than the 2,300 mu and 1,500 displaced people per 10 MW for existing stations and the 390 mu and 430 displaced people per 10 MW for stations now under construction; moreover, they are even lower than the values for the upper reaches of the Hongshui He and Huang He, which are well known as rich sources of hydropower (see Table 2). The plans calling for multiple hydroelectric stations on the mainstream of the Wu Jiang thus represent a breakthrough in that they provide for regulatory reservoirs while minimizing flooding losses.

3. Scale and Geographic Location of the Stations Are Suitable

The region through which the Wu Jiang flows is rich in minerals and contains a large fraction of the coal, aluminum, phosphorous, mercury, lead and zinc found in China, and the construction of a heavy industrial base now underway is greatly increasing the demand for power. The river region proper is bounded to the north by eastern Sichuan and to the east by western Hunan, both of which have a critical need for electric power.

The mainstream of the Wu Jiang is situated quite close to the major power-using centers--the sites of the hydropower stations planned for the upper and middle reaches of the Wu Jiang lie just 50 - 130 kilometers from Guiyang and Zunyi (measured linearly); their distance from Chongqing ranges from 160 to 300 kilometers. The stations on the lower reaches are approximately 500 kilometers from Changsha, which again lies within the range for effective power delivery. With the construction of the hydroelectric stages on the mainstream of the Wu Jiang, China will have a hydroelectric power base for supplying Guizhou, Sichuan, and Hunan Provinces.

The installed capacities of the stations (generally between 500 and 2,000 megawatts) suffice to meet the growth in power demand and are realistic given China's present capabilities.

4. Preliminary Work Has Already Been Done and the Plans Are Geologically Feasible

Since the Revolution in 1949, the various departments in China concerned with surveying and planning have earnestly and repeatedly studied plans for developing the mainstream of the Wu Jiang, and a great deal of groundwork has already been completed. Preliminary statistics indicate that up to the present time, 140,000 meters of holes have been drilled and 12,600 meters of tunnels bored at 12 of the dam sites previously studied; this is in addition to a great deal of activity in compiling all types of scale maps showing the geological features of the area. The surveys and experimental work have added to our knowledge regarding the engineering, geological, and hydrological conditions on the Wu Jiang. The mainstream of the Wu Jiang is deep and the strata beneath the river bed are thin; for the most part, seepage is confined to small areas in the reservoir regions, and all of the dam sites have water-impermeable strata that ensure reliable water retention. The bases of the dams will rest on a thick layer of limestone suitable for supporting tall dams. Earthquakes are seldom severe (their intensity is at scale 6 or below); moreover, although natural construction materials are lacking, artificial aggregate materials are in plentiful supply. The foregoing discussion shows that the preliminary development plans are geologically sound. In the past, proposals to construct dams on the Wu Jiang were met with skepticism because of the numerous karsts present in the region. Now, however, with the Wujiangdu hydropower station already successfully completed and construction of the Dongfeng station formally under way, we have gained valuable experience in dam construction in karst regions, and it has become clear that if the surveying and planning work is carried out meticulously, the technical means are available for building dams in karst regions.

5. Less Engineering, Low Cost per Kilowatt

Because of the favorable topography at the dam sites on the Wu Jiang, the size of the construction centers will be relatively small and the cost per kilowatt will be quite low. The Wujiangdu hydropower station, which was completely finished in 1983, has an installed capacity of 630 megawatts and cost 588 million yuan; the cost per kilowatt (993 yuan) compares favorably with other large hydropower stations which have come on-line in recent years. Budget estimates for the Dongfeng station, with an installed capacity of 510 megawatts, give a cost of 660 million yuan, or a relative cost of 1,290 yuan per kilowatt, which is also quite low compared with the costs at other large and mid-sized hydroelectric stations. In addition, preliminary plans have been proposed for the Pengshui and Goupitan stations to have installed capacities of 1,200 megawatts and 2,000 megawatts, respectively, at a cost of 1.44 billion and 2.18 billion yuan, corresponding to 1,200 yuan and 1,090 yuan per kilowatt, respectively. Again, these values are quite good.

Table 2

River section	Hongshui He	Huang He (from Longyangxia to Qingtongxia)	Wu Jiang
Number of power stations	10	15	9
Installed capacity (10 MW)	1112	1246.4	800
Yearly output (10^8kWh)	603	500.6	400
Farmland flooded (10^4 mu)	16.43	34.11	8.25-10
Persons displaced (10^4)	18.03	18.43	8.25-10
Relative flooded area (mu/10^4 W)	148	273	103-125
Relative displaced population (people/10^4 W)	162	148	103-125
Flooding/energy ratio (mu/10^8 kWh)	272	681	206-250
Displacement/energy ratio (people/10^8 kWh)	299	368	206-250

6. Improved River Navigation

The main stream of the Wu Jiang is full of shoals and rapids and the river channel is narrow, which accounts for its notoriety as a dangerous river for navigation. The 485 kilometers of river channel between Wujiangdu and Longtan contains 355 shoals of various sizes which pose great difficulties to navigation. Dredging operations begun after liberation in 1949 have made it possible for passenger and cargo vessels in the 20-100 tons class to navigate the 450-km-long stretch of river between Dawujiang to Fuling; however, the shallowness and narrowness of the river bed, the sharp bends in the river, and other difficulties continue to rule out all but seasonal travel upstream from Longtan. As a result, navigation remains restricted in the Guizhou interior and in Sichuan, and boat travel is very inconveneint. With the construction of the multistage hydropower project on the main stream of the Wu Jiang, however, some of the shoals will be flooded and the river bed will be broadened and deepened; at the same time, navigation on the middle and lower reaches of the Wu Jiang will be facilitated by dredging and by the regulatory action of the reservoirs, which supplement the river discharge during dry spells. This will make it possible to link Guizhou Province by water transport to the mainstream of the Chang Jiang.

Conclusions

To summarize, we believe that conditions are exceptionally favorable for the development of the Wu Jiang. A great deal of waterpower is available with minimal flooding losses, the cost/power ratio is low, the geological conditions are favorable at the dam sites, the geographic features are good, and navigation conditions on the Wu Jiang will be improved. Upon completion, the project will turn the Guizhou-Sichuan-Hunan region into a hydroelectric power base. Moreover, the economic growth of this region also requires that the pace of development of the Wu Jiang be quickened. The pr-sent task to compile the various plans and reports into a final document to clarify as quickly as possible the policy and procedural issues involved. If the development of Wu Jiang multistage power project is pursued steadily in the future, there is reason to hope that the river can be transformed into a hydropower base within the next 20-25 years.

U.S. SAID EAGER TO SUPPORT THREE GORGES PROJECT

Hong Kong TA-KUNG PAO in Chinese 15 Mar 86 p 2

[Text] U.S. Department of Energy Secretary Herrington met with Premier Zhao Zhiyang in Beijing yesterday. Herrington said that on this trip he proposed to China the U.S. willingness to supply technology, equipment, and scientific/technological know-how and to cooperate with China to build the huge Three Gorges hydroelectric plant.

The day before yesterday, Herrington met with China's Minister of Water Resources and Electric Power Qian Zhengying to discuss the Three Gorges project. Yesterday, Zhao Zhiyang told Herrington that China had already begun preparatory work on the Three Gorges hydroelectric project, but there are some economic and technical aspects which have to be advanced for discussion. Zhao Zhiyang added that China wants to cooperate with foreigners for technology, equipment, and acpital for the Three Gorges project.

On this visit, Herrington is seeking advice and also is going to Sichuan to inspect the Three Gorges site, reflecting the firm desire of U.S. firms to try to find a way to participate in the building of this enormous, world-class hydropower station.

The Sino-U.S. nuclear cooperation agreement had a lot of problems until last year, when it was finally signed. Aspects of Chinese development of nuclear power plants and Western Europe moving ahead of the United States were connected to the U.S. Congress's delay in approving the Sino-U.S. nuclear power cooperation agreement. Herrington's visit to China exactly coincides with China's stepped-up preparations to build the Three Gorges hydropower station and both sides hope to cooperate in some fashion on this project.

The State Council recently approved the establishment of a provincial administrative division for Sanxia. The area includes the area east of Wan Xian in Sichuan and west of the town of Yichang in Hubei, a total of 34 towns. The Gezhouba project is already producing electricity. From now on, China will take advantage of this source of electric power to develop the Sanxia key water conservation project with an investment of over 10 billion yuan.

The decision to create the new administrative region would almost certainly signal the beginning of the Three Gorges project. This is one of the world's largest hydroelectric projects and will satisfy China's hopes regarding energy shortfalls. The Chang Jiang has unlimited hydropower resources. The Chinese have dreamed for decades of a Sanxia hydroelectric station and finally it is becoming a reality.

But to build the world's largest, most modern hydropower station, it will not be easy for China to handle the financial resources, technology, and equipment. China hopes to cooperate with foreigners and this means giving foreign industry mutual benefit. Thus, Chinese-foreign discussions on cooperation will surely be a tortuous process. After Herrington's trip to Beijing and his inspection trip to the Three Gorges in Sichuan, he predicted that those concerned with a China-U.S. project will begin contacts.

It has been reported that the U.S. Department of Commerce is willing to spend U.S.$2 million toward a Three Gorges project feasibility study, demonstrating U.S. interest in cooperating with China on this project. Herrington is the secretary of the Department of Energy. Energy is the major constraint in China's economic development. In the future, China and the United States could have much to do in cooperating on energy on a principle of mutual benefit.

BIDDING BEGINS ON FUJIAN'S SHUIKOU PROJECT

OW051911 Beijing XINHUA in English 1541 GMT 5 May 86

[Text] Fuzhou, 5 May (XINHUA)--International bidding on the civil engineering work on the Shuikou hydroelectric power station in east China's Fujian Province began today.

More than 30 companies from Brazil, France, Federal Germany, Italy, Japan, Spain, the United States, and China have sent representatives to Fuzhou, capital of Fujian Province, to compete for contracts. Their bids will be opened in 70 days.

The scheme, the biggest in China to be financed by the World Bank, is one of the country's key construction projects for the Seventh Five-Year Plan (1986-1990).

The power station, to be built on the Min Jiang, will have a generating capacity of 1,400,000 kilowatts.

HUNAN BEGINS CONSTRUCTION OF 1200MW WUQIANGXI PROJECT

HK090301 Changsha Hunan Provincial Service in Mandarin 2200 GMT 6 May 86

[Text] The construction of Wuqiangxi hydroelectric station -- one of the key projects in the Seventh 5-Year Plan of our country -- started yesterday morning [6 May]. The Wuqiangxi hydroelectric station is situated on the upper reaches of the Yuan Shui on the borders of Taoyuan and Yuanling counties. At present, a road leading to the site has been basically completed and a construction command set up.

Interviewed by a reporter of this station at the worksite, Lu Youmei, Vice Minister of Water Resources and Electric Power, said: The installed capacity of Wuqiangxi hydroelectric power station will be 1.2 million kilowatts and its annual electricity output 5.5 billion kilowatt-hours. In the east region of China, it ranks next to the Gezhouba power station. This power station will be completed in 1994. After its completion, it will not only increase electricity output but also regulate the flow of the Yuan Shui and alleviate the threat of floods in the Dongting Hu region.

TIANSHENGQIAO POWERHOUSE UNDER WAY--Construction recently began on the powerhouse of the Tianshengqiao hydropower station (second cascade) in Guangxi Province--a major state project. Situated as it is on the bank of the river with a 220-meter-high, 30-degree slope, construction will be quite difficult. Six 220,000-kilowatt generators are to be installed in the station (for a total installed capacity of 1.32 million kW), the first of which is scheduled to become operational in 1989. When completed, the station will generate some 8.2 billion kilowatt-hours of electricity a year. [Text] [Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 20 May 86 p 3] /12232

SHAJIAO-B BEING RUSHED TO COMPLETION

Guangzhou NANFANG RIBAO in Chinese 6 Apr 86 p 2

[Excerpt] On the construction site of the Shajiao-B plant, an army of more than 1,500 Chinese and foreign workers and technicians are working 'round the clock on an accelerated schedule. Most of the foundation work has been completed and the main plant buildings are beginning to take shape. It is projected that the first 350MW generating unit could be a producing power by "7-1" of 1987.

Situated on the Pearl River Estuary at Hu Men, Dongguan, Shajiao-B will have a total installed capacity of 700,000 kilowatts. It is a joint project on the part of the Shenzhen Special Economic Zone Power Development Company and the Hong Kong company of Hopewell Power (China) Ltd. Ground was broken on this plant on 28 September 1984 and construction officially got under way on 1 July 1985. Total investment will be HK $3.2 million and the equipment is imported from Japan. When completed the plant will generate 3.6 billion kilowatt-hours of electricity a year (calculated on 60 percent capacity). This project is a joint effort on the part of the Hong Kong Hopewell Construction Company Ltd., general contractors, five technically capable Chinese construction companies, and the Hong Kong Sliding Form Construction Company. The plant buildings require an area of 400,000 square meters, all of which had to be created from fill. With herculean effort, the construction workers had managed to complete the huge earth and rock moving task by the end of June 1985, creating a landfill of some 1.3 million cubic meters. After this they began pouring the concrete for the main plant buildings and the boiler foundations.

COAL

COAL MINISTRY RESTRUCTURES ECONOMIC SYSTEM, UPS OUTPUT

OW191425 Beijing XINHUA Domestic Service in Chinese 0701 GMT 14 May 86

[Excerpts] Beijing, 14 May (XINHUA)--While restructuring its economic system and promoting coal output, the Ministry of Coal Industry has persisted in improving the conduct of its party members. The improvement of the party members' conduct has resulted in ensuring reform and enhancing coal production.

The coal industry has scored remarkable achievements in restructuring its economic system in recent years. Some people in certain units, however, took advantage of certain loopholes in reform and behaved improperly, such as by lavishing public money on food and drink, indiscriminately issuing bonuses in cash and in kind, purchasing imported luxury cars, and so forth. The ministry's leading party group maintained that, unless these irregularities were promptly curbed, they would obstruct reform and dampen the masses' production enthusiasm. The ministry's leading party group thus took firm steps to improve party conduct while expediting reform and production, considering all these matters equally important. When the ministry's departmental and bureau directors met in Changchun last July to discuss how to carry out the various reform projects, they were also informed of the several cases of indiscipline and were urged to take clear-cut measures to deter unwarranted issuances of bonuses and subsidies and discourage lavishing money on food and drink.

The Ministry of Coal Industry made it a practice to act firmly and promptly in dealing with whoever took advantage of reform and misbehaved. When the bonus system was reformed, the leading cadres of some enterprises used the opportunity to seek personal gains. In 1984, 158 leading cadres at and above the departmental level of the Yaojie Mining Bureau were given bonuses averaging 2,049 yuan each, or 5.8 times more than the average bonus a staff worker of the bureau got that year; each of the six bureau-level cadres received an average bonus of 3,564 yuan, with the highest bonus being 4,344 yuan. The ministry and Gansu Province, where the mining bureau is located, took decisive steps to deal with this typical case. They reorganized the mining bureau's leading group, dismissed those who deserved to be dismissed, and reprimanded those who should be reprimanded. Those who were issued more bonuses than they deserved were instructed to reimburse the bureau.

Thanks to the improvement of party conduct and the attention given to restructuring the economic system and promoting production, such unhealthy practices as lavishing money on food and drink, issuing unwarranted bonuses in cash or in kind, purchasing imported luxury automobiles, and improperly accepting cash or gifts have been stopped in units of the Ministry of Coal Industry in Beijing. Many people have been commended for having deterred unhealthy practices.

The improvement of party conduct has promoted coal production, and the situation in the coal industry has become increasingly promising. Contrary to the previous practice of needing more people in order to increase output, coal mines whose output is distributed by the state increased their coal output by 11.56 million metric tons last year even though the number of their workers and staff had been reduced by 110,000.

STATE-RUN MINES EXCEED TARGET IN FIRST QUARTER

HK170748 Beijing CHINA DAILY in English 17 Apr 86 p 2

[Report by Staff Reporter Xu Yuanchao]

[Text] China's state-owned mines produced 104 million tons of coal in the first quarter of the year, exceeding their target by 3.5 million tons, the Ministry of Coal Industry announced yesterday.

The first quarter output accounts for 25.13 percent of the 1986 plan. A bigger increase in production may be seen in the second quarter, a ministry official said.

The industry as a whole produced 870 million tons of coal last year, but the plan for this year set output no higher than last year, the official told CHINA DAILY.

Of the year's target, 420 million tons will be produced by state-owned coal mines and 450 million tons by local mines. In the past, production by local mines made up 40 percent of total output.

The small coal mines run by local governments,townships, and individuals are mainly located in Shanxi, Henan, and Hebei provinces. "The small coal mines have developed very fast in recent years, but it is difficult to estimate how much they can increase output this year," the official said.

He attributed the development of small mines to a policy of encouragement by the state which urges local governments to open small mines, while the state provides some funds for roads to the mines.

Output from small mines run by individuals is about 15 million tons, but the working life of small mines is short because of unsafe working conditions and manual production methods.

The state had earmarked 5.3 billion yuan this year for capital construction in the coal industry. The funds will be used to open up a number of modern mines and to upgrade some old ones. About 40 percent of the funds will be used for training, housing, manufacture of mining equipment, and scientific research.

He said the government planned to curtail investment in capital construction in the first 2 years of the current 5-year plan. Some mines with a small annual capacity would be shut down because of a shortage of funds.

COAL

STOCKPILES GROW AS TRANSPORTATION BOTTLENECKS CONTINUE

HK210125 Beijing ZHONGGUO XINWEN SHE in Chinese 1448 GMT 20 Apr 86

[Text] Beijing, 20 Apr (ZHONGGUO XINWEN SHE) -- Our correspondent has learned from the Ministry of Coal Industry that as of the end of March state coal mines in China had a total stockpile of 13.33 million tons, over 2.2 million tons more than at the same time last year.

According to our information, the shortage of transport is the main reason for the coal stockpile. Some mining areas can only ship out on a day the coal they produce that day, and can do little about the accumulated stockpiles they have on hand. Long periods of stockpiling have caused phenomena such as spontaneous combustion and run-off.

The biggest stockpiles of coal now are in Shanxi Province, where over 4.64 million tons are stockpiled, mainly at the Datong, Yangquan, Huoxian, and Fenxi mines. Shanxi is followed by the Northeast-Nei Monggol coal industry combine, where over 3 million tons are stockpiled, mostly at Heilongjiang's Xixi, Hegang, and Qitaihe mining areas.

The Chinese railroad departments are currently doing everything possible to improve coal transport capacity. Construction of three main railroads in north, east, and south China for transporting coal from west to east is being stepped up. Tracks are now being laid on the line from Datong to Qinhuangdao, which will mainly transport coal, and the electrification of the Fengtai-Shacheng-Datong, Shijiazhuang-Taiyuan, and Taiyuan-Jiaozuo lines, which ship Shanxi coal out of the province, will be vigorously tackled this year. Double-tracking of the Shuoxian-Datong section of the North Tongpu line, which is being undertaken in association with the development of the Pingshuo coal field, will be completed this year. By 1990, the transport capacity to ship Shanxi coal out of the province will reach 270 million tons, 150 million tons more than last year.

Work has also started on the Xingan tunnel on the Binzhou line and the Ducao tunnel on the Binsui line, both in northeast China, with the aim of improving coal transport capacity in the eastern and northern parts of the region. Double-tracking is also being carried out on those lines section by section. The departments concerned are also dredging the Huang He ship channels in order to develop waterway coal transport.

COAL

HENAN LAYS PLANS FOR COMPREHENSIVE USE OF COAL

Zhengzhou HENAN RIBAO in Chinese 3 Mar 86 p 4

[Excerpts] Henan is very rich in coal resources and by developing pit-mouth thermal power, coal is transformed into electricity on the spot. This not only solves the long-term electricity shortage of the province's agricultural and industrial production, but makes it possible to transmit electricity out of the province which is more profitable than shipping out coal. It could relieve the strained railroad situation and reduce coal mine overstock. At the same time, developing comprehensive use of coal could spur new industrial development. Therefore, concentrating on electricity generation and the comprehensive use of the province's vast coal resources should become a major guiding ideology for Henan's economic development strategy. In the past, we were unclear about this and for a long time, we sold coal and bought electricity; electricity produced by coal was flowing in the wrong direction and coal resources were overstocked. This is both wasteful and irrational. For example, the electric power shortage in Henan in 1984 was 2.4 billion kWh and in 185 it was even more. This loss of several billion kWh of electricity even affects electricity usage for urban life. In April 1984, when Comrade Hu Yaobang came to inspect Henan, he pointed out, "The on-site transformation of coal to electricity is most economical. From now on, for the next 10 to 20 years, Henan's annual increase of 600 megawatts will equal one-tenth of the national annual increase in electric power." His words made us think: In energetically developing small thermal power bases, we should concentrate on the comprehensive use of coal. From the reality of the situation of our province, the writer considers that during the Seventh Five-Year Plan, and even during the next 10 to 20 years, we should concentrate manpower, material resources, and financial resources in western Henan, northern Henan (Jiaozuo area), and southern Henan (the Pingdingshan area). Because these three regions have coal and water, they have ready-made thermal electric bases; add to this convenient transportation, and we can start quickly and produce results. For example, in western Henan, power plants could be built at the pit mouths and road junctions, effecting local transformation of coal and water resources. We could not only reduce the pressure of coal transport on the railways in Shaanxi, Shanxi, and Henan, but also satisfy the electrification power need of railroads in these regions. Another aspect is that we can ship less coal and transmit more electricity, not only easing the burden on Shaanxi and Shanxi, but also quenching eastern China's thirst for electricity. In this way, we can further improve social benefits and comprehensive economic benefits. From the point of view of the province, by concentrating on the comprehensive use of coal, in the near future we can alleviate the contradiction between energy consumption and demand and greatly resolve the serious situation in buying electricity over the long term. Because of power shortages, production capacity cannot be fully utilized, representing an annual loss of nearly 10 billion yuan, a loss which could be recovered through the above measures. Another aspect is the increased benefit from, and reduced waste of, coal resources. (According to calculations, 1 ton of raw coal has a more than 3-yuan profit margin. After dressing, the profit margin increases to 8 yuan. Taking as a basis the direct fuel value, production of coal tar increases the value 10 times; processing into plastics increases the value 90 times; dyes increase the value 370 times, and synthetic fibers increase the value even more.) Work on the preliminary stages of the large-scale thermal electric plant in western Henan has already begun. During the Seventh Five-Year Plan, Henan will finish the main construction at the three large thermal electric power bases at Yaomeng, Jiaozuo, and Shouyangshan, and the new construction at the Hebi power plant. Preliminary plans for the next decade include construction of a host of power plants in the three large thermal power electric bases. At the same time, we can use Shaanxi coal and Huang He water to build the Sanmenxia west power station, Yima coal and Huang He water to build the Yima power station, and Deenfeng coal and Yahekou Reservoir water to build the Yahekou power station. Moreover, we can expand and renovate a number of old electric plants and also develop some small thermal electric plants. By the end of the century, the estimated capacity could be nearly 15 million kilowatts; western Henan's electric power generation alone could satisfy the needs of the whole province.

HUAINAN TO BECOME 'ENERGY CITY' OF EASTERN CHINA

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 12 May 86 p 1

[Excerpt] According to a report in JIEFANG RIBAO [LIBERATION DAILY], Huainan City will become the largest 'energy city' in the East China region. In the Sixth Five-Year Plan, the state invested some 3 billion yuan and in the Seventh Five-Year Plan an additional 500 million yuan a year will be spent on developing Huainan coal and electric power.

Huainan's coal resources are enormous, with 14.6 billion tons having been verified; in the last 30 years, Huainan has supplied 260 million tons of coal to the nation. During the Sixth Five-Year Plan, the 3-million-ton-a-year Pan-1 mine became operational and in 1985 Huainan produced some 9.6 million tons of [raw] coal. In the Seventh Five-Year Plan, construction will continue on the mammoth mines of Pan-2, Pan-3, and Xieqiao-3, whose total capacity will be 10 million tons a year. Three coal dressing plants with a capacity of 3 million tons will be built concurrently. Also during the Seventh Five-Year Plan, three very large mines with an annual capacity of approximately 4 million tons will be started. By 1990, Huainan will be producing more than 14 million tons of coal a year.

Making use of its superior coal resources, Huainan is exerting a major effort to develop pit-mouth power plants. Today, Huainan is in the first stage of construction on the two power plants of Luohe and Pingyu, with installed capacities of 600 megawatts and 1,200 megawatts respectively. Luohe already has its first 300MW generator in operation. Before the end of the Seventh Five-Year Plan, Huainan's total installed capacity could reach 2,400MW for an annual power output of 16 billion kilowatt-hours of electricity, representing about 10 percent of the output of the East China Grid.

COAL

HUAINAN TO GREATLY INCREASE PRODUCTION

OW120412 Beijing XINHUA in English 0154 GMT 12 May 86

[Text] Beijing, 12 May (XINHUA)--Huainan City, a major coal producer in Anhui Province, will increase its annual output from the current 9.6 million tons to more than 14 million tons in 1990, to become the largest coal producer in east China, today's LIBERATION DAILY reported.

The city, north of the province's capital of Hefei, will develop three more large mines in the next 5 years with an annual production capacity of 4 million tons each, according to the Shanghai-based paper.

The state will invest 3 million yuan in the exploitation of the city's coal and electricity resources during the Seventh Five-Year Plan (1986-90), equal to the investment during the past 5 years.

Taking advantage of its rich coal resources, Huainan will also develop its power [plants]. By 1990 the city is expected to generate 16 billion kWh, which will account for about 10 percent of the total generating capacity of the eastern China area, the paper said.

BRIEFS

SHANDONG DISCOVERY--Huge coal deposits have been found beneath the Weishan, Zhaoyang, Dushan, and Nanyang lakes in southwestern Shandong Province. The Shandong Coal Field Geological Prospecting Company has verified these reserves to be in the neighborhood of 2.5 billion tons. [Text] [Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 17 May 86 p 3] /12232

LIANG HUAI EXPORTS--Hefei, 28 April, XINHUA SHE--The Liang Huai mining district in Anhui Province exported more than 500,000 tons of coal in 1985, generating some 26 million dollars. On this springboard, exports in the first quarter of 1986 exceeded those of the same period of 1985 by 28 percent. Coal resources in the Liang Huai mining district are enormous, with many varieties of excellent quality. The district is only a little more than 300 kilometers from Lianyungang and can be transported directly from the pit mouth to the docks of this port by truck. The coal has a low ash content and high heat yeild and is purchased by traders in Japan and Southeast Asia. [Text] [Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 30 Apr 86 p 3] /12232

NEW SHAANXI FIND--Beijing, 6 May (XINHUA)--A coal field with over 9 billion tons of reserves has been found in Binxian County in northwest China's Shaanxi Province. [Text] [Beijing XINHUA in English 1432 GMT 6 May 86 OW] /12232

200-BILLION-TON FIELD REPORTED--Xi'an, 7 May, XINHUA SHE--The overall development plan for the Shenfu coal field in northern Shaanxi Province--said to be one of the world's seven major fields--was recently approved in principle by the mining region's overall planning review commission organized by the Ministry of Coal Industry. The Shenfu coal field is a mammoth one verified in the last few years. Within the 20,000-square-kilometer field are reserves approaching 200 billion tons. The field's geological structure is simple and the layers are stable and at shallow depths. The coal is low-ash, low-sulphur, and low-phosphorus coal with high heat output. Experts predict that by the end of the century, the Shenfu coal field will constitute China's biggest coal base for motive-power and export coal. [Text] [Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 9 May 86 p 1] /8309

NEW HEILONGJIANG FIELD REPORTED--Recently, the Northeast-Inner Mongolia Coal Industry Joint Company's geology department discovered a new coal field at Dashiqiao, Jixi City, Heilongjiang Province. Preliminary exploration shows that the field has an area of some 60 square kilometers and the seams are about 10 meters thick. The coal is brown coal and the reserves are approximately 500 million tons. The coal is buried at a depth of 400 meters; geological conditions are excellent, facilitating exploitation. Also, the geology department has found another coal field at Jiudaoling in Yi Xian, Liaoning Province with reserves of 50 million tons. [Text] [Beijing RENMIN RIBAO (OVERSEAS EDITION) in Chinese 15 Mar 86, p 1] /9604

VAST SHAANXI FIELD VERIFIED--A large coal field with an estimated reserve of 9 billion tons has been verified in Binxian County, in central Shaanxi. [Text] [Beijing XINHUA in English 1100 GMT 1 May 86 OW] /9738

XINJIANG STRIP MINE--Urumqi, 13 May (XINHUA)--Construction will start next year on an open-cut coal mine 30 kilometers from this capital of the Xinjiang Uygur Autonomous Region, a regional official announced today. The Tiechanggou mine will have an annual production capacity of 1,500,000 tons upon completion in the next 5 years, the second largest open-cut mine in the region. The biggest is the Sandaoling mine, which went into production in the 1970s. The area around Urumqi has 7 billion tons of verified coal reserves out of the region's total of 18.3 billion tons. OIL AND GAS

NEW TECHNOLOGY MAINTAINS FLOW OF HUABEI CRUDE

OW161233 Beijing XINHUA in English 0941 GMT 16 Apr 86

[Text] Shijiazhuang, 16 Apr (XINHUA)--The Huabei oil field has adopted new technology to maintain an annual output of 70 million barrels, as it has over the past 10 years, according to oil field officials.

The third-largest in China, the oil field, which opened in 1976, is of the buried hill formation type, which gives high output at the outset but has a fast depletion rate.

Output was as high as 85 million bbl in 1978, but in 1984 it decreased rapidly and was some 40 percent less than the 1978 figure.

To maintain steady output, the oil field adopted such techniques as pumping emulsifying acid into the wells to dissolve obstructions, and the application of a new chemical agent that controls the movement of water around the wells. Improved water-injection methods have helped restore the natural pressure, oil experts said.

Last year, the oil field pumped out 72.17 million bbl of crude oil, 770,000 bbl more than in the previous year.

Over the past 5 years, more than 218 technological achievements have been made, of which 177 have been applied to production.

The oil field now has some 3,500 technical personnel and is equipped with more than 500 sets of facilities and instruments for scientific research.

QINGHAI'S QAIDAM BASIN STEPS UP PROSPECTING EFFORT

OW081445 Beijing XINHUA in English 1349 GMT 8 May 86

[Text] Xining, 8 May (XINHUA)—Chinese geologists have stepped up exploration for oil in the Qaidam Basin in Qinghai Province which promises to be one of the most oil-rich regions in China.

In recent years, Qinghai Province has imported oil exploration equipment from the United States, including seismic survey vehicles, and electronic computers, and cooperated with the Geosource Company, U.S.A. in an extensive search for oil in the basin.

Up to the present, the province has verified geological reserves of up to 200 million tons, including the record find of 19 million tons last year, according to the provincial oil administration.

Geologists used helicopters and advanced instruments and meters to obtain a large amount of petro-geological data in some inaccessible areas.

Qaidam Basin is one of four inland basins in China, with sediment strata covering more than 120,000 square kilometers. It is believed to be one of the most promising oil-rich regions in the country.

To date, geologists have verified 47 oil fields and 5 gas fields with an estimated reserve of 8.9 billion cubic meters in addition to hundreds of oil potential strata and structures.

The province has decided to explore for 400 million tons of geological oil reserves in the next 5 years, according to a plan worked out recently.

OIL AND GAS

IMPORTS OF SEISMIC EQUIPMENT FOR OIL EXPLORATION TO CONTINUE

HK111219 Beijing CHINA DAILY in English 11 Apr 86 p 2

[By Staff Reporter Xu Yuanchao]

[Text] China will continue to build up its seismic expertise and import state-of-the-art equipment despite declining income as a result of the current world oil glut.

Cai Peijian, deputy chief engineer of the Petroleum Ministry, told an OPSEIS (Optimum Seismology) users conference in Beijing that although income from crude oil exports has dropped, China will earmark some funds for developing the seismic expertise vital to China's future oil exploration programme.

The users conference, the first of its kind, was sponsored by Applied Automation Inc (AAI), a subsidiary of the Philips Petroleum Company of the United States.

The conference's main purpose is to use combined experience to solve field problems encountered during the first 2 years of operation and to transfer the knowledge of how to use an OPSEIS system.

Lee de Martino, AAI general manager, said at the meeting that his company would be concluding a memorandum of understanding for an OPSEIS service center in Beijing during his visit.

The center, staffed by Chinese personnel, will eventually provide an information network allowing the Oklahoma-based company to pass on new product developments and improved operational techniques to the Chinese.

De Martino said: "The world seismic industry is currently in a dramatic downward cycle. Many companies throughout the world are doing business at below cost and many are going bankrupt.

"We took a hard look at our business as early as 1982 and began to tighten our belts, slashing costs while increasing the efficiency and productivity of our work force. This has helped us remain in a profitable position during these difficult times," he said.

De Martino told CHINA DAILY that China had bought seven complete OPSEIS systems, valued at 13 million. These systems are now used in "mountainous regions, transition zones and shallow water" in six different areas including Nanjing, Sichuan Province, Shengli beach, Renqiu and Dagang oil fields.

OIL AND GAS

EXPLORATION CONTINUES DESPITE MARKET CRISIS

OW050550 Beijing XINHUA in English 0531 GMT 5 May 86

[Text] Beijing, 5 May (XINHUA)--Despite the tumbling of world oil prices, foreign firms are continuing with their involvement in the exploration of China's offshore shore oil resources, according to a senior official of the China National Offshore Oil Corporation (CNOOC).

No foreign participants have so far withdrawn from their joint operations with China, said CNOOC deputy general manager You Dehua.

You attributed this to a series of "still more flexible methods" taken by China to attract foreign investment, including exemption of the fees for using oil fields with an annual production capacity of less than 7 million bbl [as received].

Chinese and foreign firms have verified 10 offshore oil and gas fields, he said.

One in the Bohai Sea, north China, has gone into partial operation and another in the Beibu Gulf in the south will start trial production in August. Feasibilities studies are going on for the exploration of the rest of the fields.

In addition, the route for a 1,000-kilometer pipeline from Hainan Island to Shenzhen in south China has been chosen.

OIL AND GAS

NEW OIL EXPLORATION THEORY APPLIED AT SHENGLI

OW121931 Beijing XINHUA in English 1858 GMT 12 Apr 86

[Text] Jinan, 12 April (XINHUA) -- Testing a new theory about oil exploration, Chinese scientists have discovered oil and gas reserves throughout almost all the levels of the earth at the Shengli oil field, China's second largest.

The theory, which argues that levels of the earth include many elements, led to the discovery of 53 oil pools -- including 32 already in production -- in the Shandong Province oil field, an energy official said here today.

The new theory, which geologists call the "composite oil and gas reserve" theory, was developed by Li Desheng, chief geologist at the Planning and Research Academy of the Ministry of Petroleum Industry in Beijing.

Shengli, at the estuary of the [Huang He] produced 189 million bbls of oil last year, second only to the Daqing field in Heilongjiang Province which produced more than 700 million bbls.

Prospecting began at Shengli in 1964. Early findings encouraged geologists to sink two wells that eventually produced 3,885 and 7,000 bbls of oil per day.

But even though these and other wells were successful, petroleum geologists at Shengli frequently found no oil in spots where conventional theory predicted there would be substantial reserves.

More than a few scientists said traditional research could not accommodate the field's unusually complicated geological formations.

"Sometimes, water gushed out from strata believed to contain oil and gas," Yang Shenbiao, deputy director of Shengli's Geological Research Institute, told XINHUA today.

According to Yang, Li's new theory was welcomed by the geologists at Shengli. And under its guidance, high-yielding wells were sunk in places once believed to have no oil, he said.

Li's theory, which Yang said is not easily summarized, covers possible interrelations between adjacent levels of the earth.

This means, Yang said, "that there might be pools of oil right next to places where there is only water."

In line with the theory, geologists have come to believe the eastern part of the oil field -- a 12,000 square kilometer area known technically as the Jiyang Depression -- is rich in oil and gas, said Yang.

In that depression, according to the theory, there should be pools of oil at depths ranging from 600 to 6,000 meters.

Preliminary prospecting has confirmed projections based on the theory, Yang said. "And as a result, Japanese and U.S. geologists are beginning to take it seriously."

OIL AND GAS

NATURAL GAS DEPOSITS DISCOVERED IN HENAN

OW171815 Beijing XINHUA in English 1815 GMT 17 Apr 86

[Text] Zhengzhou, 17 Apr (XINHUA)--Chinese geologists have discovered two coal gas-bearing structures in the Zhongyuan (central China plain) oil field, according to Henan Province petroleum authorities.

A test well completed recently shows that the gas-bearing layer is 120 meters thick.

As one kind of natural gas, coal gas is a new topic in China's geological exploration and study, the petroleum authorities said.

Zhang Wenyou, a noted geologist of the Chinese Academy of Sciences, decided to help the local petroleum administration study coal gas in 1983 when he visited the oil field. Zhang's decision was backed by the State Economic Commission.

After 3 years' intensive study, geologists of the oil field and other research institutes have prepared a report on the coal gas deposits.

TWO SINO-U.S. JOINT VENTURES ESTABLISHED

OW160009 Beijing XINHUA in English 2127 GMT 15 Apr 86

[Text] Beijing, 15 Apr (XINHUA)--Sino-Fluor Engineers, a Chinese-U.S. joint venture which was set up here today, signed a contract for building a hydrocarbon tank [farm] for China's Daqing oil field.

Organized by the China Petrochemical International Company (SINOPEC International) and Fluor Engineers, Inc. of the United States, the new company will provide production facilities, pipelines, terminals, hydrocarbon processing, petrochemicals, synthetic fuels, power generation, and industrial and infrastructure services worldwide.

Three days earlier, another joint venture--the Hua-Lu Engineering Co. Ltd.--was established by SINOPEC International and the American Lummus-Crest Inc. It is mainly engaged in petroleum refining, petrochemical, natural gas, and power industries, offering project feasibility study, engineering design and a wide range of technical services.

U.S., JAPANESE CONSORTIUM HITS OIL IN PEARL RIVER BASIN

OW211916 Beijing XINHUA in English 1630 GMT 21 Apr 86

[Text] Guangzhou, 21 Apr (XINHUA) -- A foreign oil consortium has hit oil in an exploratory well in the Pearl River Mouth, which is pumping out 1,680 barrels a day, it was announced here today.

An official of the Nanhai (South China Sea) Eastern Petroleum Corporation said the well, sunk by the Pearl River Oil Operating Company, was the 10th oil-producing well to be drilled in the eastern part of the 147,000-square--kilometer Pearl River estuary.

The corporation is responsible for 103,000 square kilometers of the basin which is open to foreign bids.

The Pearl River Oil Operating Company comprises three firms from the United States and two from Japan.

Chen Sizhong, chief geologist of the Chinese corporation, said the new well was 240 kilometers southeast of this Guangdong provincial capital.

He said: "It is only 1 kilometer from the "Zhu-5 exploratory well, which produces about 1,400 barrels a day, and which was drilled by the Chinese Ministry of Geology and Mineral Resources 7 years ago.

"I think the two wells belong to the same oil-bearing structure, where we are likely to make new oil and natural gas discoveries."

He added that there were good prospects for oil and gas exploration in the eastern part of the basin.

Four of the seven exploratory wells drilled since the beginning of the year had hit oil, and four new oil-bearing structures had been found.

OIL AND GAS

MORE PRODUCING WELLS DRILLED IN PEARL RIVER ESTUARY

HK230846 Beijing ZHONGGUO XINWEN SHE in Chinese 1447 GMT 21 Apr 86

[Report: "Twelve Oil-Yielding Wells Drilled in Basin Near Zhu Jiang Estuary" --ZHONGGUO XINWEN SHE headline]

[Text] Beijing, 21 April (ZHONGGUO XINWEN SHE)--China National Offshore Oil Corporation today announced that oil and gas had been found in the Xi Jiang 34-3-1 well recently drilled in the Zhu Jiang Estuary Basin of the South China Sea. Testing has shown that this well can produce 267 tons of crude oil a day as well as a small amount of natural gas.

So far, 12 oil-yielding wells have been drilled in the Zhu Jiang Estuary Basin.

The Xi Jiang 34-3-1 well is located in the 15/33 contract zone in the Zhu Jiang Estuary. This contract zone has an area of 1,279 square kilometers. The contractor is The Pearl River Oil Operating Company, founded by five foreign companies.

The Xi Jiang 3403-1 well is 240 kilometers to the southeast of Guangzhou. Just 1 kilometer to the north of this well, the Chinese Ministry of Geology and Mineral Resources in 1979 drilled a test well--the Zhu-5 well, with a daily output of 200 tons of oil. The geological conditions of this zone have yet to be further evaluated.

OIL AND GAS

LARGE OIL DEPOSIT FOUND IN WESTERN QINGHAI

HK010427 Xining Qinghai Provincial Service in Mandarin 2330 GMT 30 Apr 86

[Text] The Qinghai Petroleum Administrative Bureau has discovered an extremely large oil deposit in the (Nayishan) area in the western part of the Qaidam Basin. The Ministry of Petroleum Industry recently decided to list the area as a pilot project area in scientific oil prospecting work this year.

The structure covers an area of 620 square kilometers. In mid-June 1985 the Qinghai Petroleum Administrative Bureau drilled to a depth of 2,981 meters there, at which point a large flow of oil and natural gas started. The flow has continued up to now, showing that there are abundant oil layers with a strong flow.

The provincial Petroleum Administration Bureau is treating the structure as a key drilling area. Three drilling teams and two oil-testing teams are now at work there.

PETROLEUM, GEOLOGY MINISTERS EXCHANGE VIEWS ON COOPERATION

OW280150 Beijing XINHUA Domestic Service in Chinese 0809 GMT 27 Apr 86

[Article by reporter Wang Yangrong]

[Excerpts] Beijing, 27 April (XINHUA)--Minister of Petroleum Industry Wang Tao and Minister of Geology and Mineral Resources Zhu Xun extensively exchanged their opinions recently on how to further strengthen cooperation between the two ministries in prospecting for oil and natural gas resources. Their cooperation was highly praised by Comrade Wan Li who said that it was a good beginning in eliminating barriers between different departments and strengthening lateral ties among various ministries.

The two ministers noted that great achievements have been made in developing petroleum production and geological work since the founding of the People's republic of China. They pointed out that those achievements were due to joint struggle by the workers of departments of the of the two ministries. In order to realize the goals set for 1990 and 2000 in petroleum and natural gas production, it is imperative to discover adequate petroleum and natural gas resources as quickly as possible. This is a very arduous task and it requires concerted efforts by both ministries' geological teams. We should have a unified plan and proceed under the principle of division of labor with good coordination. In addition, various teams should exchange data from their respective work areas to avoid unnecessary overlapping work and should fully develop the overall economic benefits of prospecting funds. Accordingly, the two ministries will jointly study the division of work in prospecting for petroleum and natural gas in 1986 and during the "Seventh 5-Year Plan."

The two ministers are convinced that merely depending on the budget set for prospecting work will be far from adequate in meeting the demand for funds. Wang Tao suggested that the method of compensatory transfer can be used in order to enable the petroleum and geological teams to have more funds for prospecting work and strengthen the vitality of various petroleum and geological prospecting units. Comrade Zhu Xun completely agreed to the suggestion because it is in line with the spirit of reform and in accord with the principle of the "Mineral Resources Law."

The two ministers also exchanged their opinions on cooperation in opening to the outside world and principles for handling some specific matters and reached a consensus.

OIL AND GAS

BRIEFS

POSSIBLE HEBEI RESERVES--Beijing, 23 Apr (XINHUA)--Geologists have found an important clue in their search for oil in western Hubei Province, GUANGMING DAILY reported today. The newspaper said they had discovered a large belt of bioherm, a reeflike mass of limestone, which often indicates the presence of oil and natural gas. The bioherm was found underneath Lichuan County, and was formed from the remains of tiny sea creatures in the late paleozoic era about 280 million years ago. It is more than 60 kilometers long and 5 kilomebers wide. The scientists were reported to be confident about finding rich oil and gas resources in the area. Natural gas had been produced since the 1950s from similar geological formations in southeastern Sichuan Province. [Text] [Beijing XINHUA in English 0706 GMT 23 Apr 86 OW] /6662

OIL FIELD DEVELOPMENT COMPANY--The Qinghai Oil Field Development and Construction Company was set up in March. The establishment of this company is a new step taken by the Qinghai Petroleum Administrative Bureau for carrying out simultaneous prospecting and development and coordinating the exploitation of the oil field. According to our information, feasibility studies have now been basically completed on projects for speeding up the development of the Qinghai oil field. These projects include an oil field producing 1.5 million tons of crude a year, a 400-kilometer-long oil pipeline to Golmud, and the Golmud refinery with an annual refining capacity of 1 million tons of crude. These projects have been officially included in the Ministry of Petroleum Industry's Seventh Five-Year Plan. The oil field development and construction company is currently firming up preparatory work, including capital, for these projects. It is estimated that the commissioning of the Golmud refinery in 3 years' time will change the province's fuel structure. Refinery by products will become available to the people throughout the province. [Text] [Xining Qinghai Provincial Service in Mandarin 2330 GMT 15 Apr 86 HK]

IMPROVED PRODUCT QUALITY--Beijing, 11 Apr (XINHUA)--China plans to build 54 petrochemical installations to improve the quality of products while increasing their variety, according to the overseas edition of the PEOPLE'S DAILY today. For this year, the government will invest 630 million yuan in these projects which, upon completion in the next 2 or 3 years, will earn 1.88 billion yuan annually. Observers say this is an attempt to minimize the loss expected from the recent worldwide slump in oil prices. [Text] [Beijing XINHUA in English 1251 GMT 11 Apr 86 OW] /12858

BOHAI OFFSHORE FIELD--Tianjin, 16 Apr (XINHUA)--North China's Bohai offshore oil field will boost its crude output more than 11 times this year over 1985 -- and 140 times by 1990, an energy official said here today. Speaking at a conference on oil production, Cao Dean, general manager of the Bohai Petroleum Corporation, said the field's annual output will increase from 140,000 bbls to 1.58 million bbls this year -- and to 19.6 million bbls by 1990. The oil field has 530 working wells, including eight added just this year, according to Cao. And, he said, it plans to spend 1.4 billion U.S. dollars over the next 5 years on prospecting and drilling. Although most of the field's investment capital has come from the Chinese government, foreign firms -- from France, Great Britain, Japan, and Norway --have participated since foreign participation began in 1979. "We welcome foreign cooperation," said Cao. Altogether, the field should produce 36.4 million bbls of crude oil and 500 million cubic meters of gas over the next 5 years, he said. [Text] [Beijing XINHUA in English 1646 GMT 16 Apr 86 OW]

NEW SHANDONG WELL--On 3 April the Shengli oil fields brought in a well with a daily crude oil output of 1,013 tons and a gas output of 75,000 cubic meters along Gudong coast. The Gudong oil field, located on the north bank of the mouth of the Huang He, was discovered in 1984 along the coast of the Bo Hai following the discovery of the Huabei oil field. /Summary/ /Jinan Shandong Provincial Service in Mandarin 2300 GMT 3 Apr 86 SK/ 12228

HUABEI OUTPUT REBOUNDS--Shijiazhuang, 7 Apr (XINHUA)--The Huabei oil field, China's third largest, has maintained an annual output of more than 10 million metric tons in the past 10 years. Since it began operations in 1976, output of the oil field once exceeded 17 million metric tons annually, and then dropped to 10 million metric tons due to various reasons. After scientists and technicians at the oil field employed modern technologies to improve prospecting and production techniques, the oil field's output rebounded to 10.31 million metric tons last year, and another 230 million metric tons of crude have been added to the oil field's deposits in the last 5 years. /Summary/ /Beijing XINHUA Domestic Service in Chinese 0912 GMT 7 Apr 86 OW/ 12228

QAIDAM STRIKES--Xining, 5 May (XINHUA)--Two oil fields, with estimated reserves of at least 140 billion bbl, have been found in the western part of the Qaidam Basin, Qinghai Province, local petrogeologists announced here today. They are located in the Nanyishan and Shizigou areas. So far, one well has been drilled in each of the areas. Oil gushed forth when the well in Manyishan reached 2.981 meters. It gives a daily oil output of 5,000 bbl in addition to a large amount of natural gas. High-quality oil accounts for more than 71 percent. The 4,564.5-meter well in Shizigou produces more than 700 bbl of oil a day. Now drilling has been begun for a dozen wells planned in the areas. There is an oil-potential area of more than 100,000 sq km in Qaidam. [Text] [Beijing XINHUA in English 1225 GMT 5 May 86] /9604

NUCLEAR POWER

LACK OF FOREIGN CURRENCY MAY HOBBLE POWER PLANT PROGRAM

HK111025 Hong Kong AFP in English 0833 GMT 11 Apr 86

[Report by Pierre-Antoine Donnet]

[Text] Shenzhen, China 11 April (AFP) -- China plans to enter the world market to sell nuclear power plants when it masters the necessary technology, a nuclear industry ministry official said Friday.

Liu Shulin, who is heading a delegation to a high-technology exposition which opened here Thursday, also gave the first official confirmation that China's nuclear power program would be slowed due to depletion of foreign currency reserves needed to finance it.

Mr Liu, a former vice-minister in the nuclear industry, told a press conference that in particular China could export nuclear power plants with 300-megawatt capacity similar to the one now being built at Qinshan near Shanghai, and would offer competitive prices.

Work on the Qinshan power station was making good progress and would be completed in 1989, he added.

Mr Liu also said that China, with rich uranium reserves exceeding domestic needs, planned to export 1,000 tons of nuclear fuel a year and that several countries had already expressed interest.

China recently signed letters of intent with Framatome as well as with the British company General Electric, on construction of its first major nuclear power plant at Daya Bay near Hong Kong.

But Mr Liu said that construction of a second large nuclear power plant at Sunan in eastern China was not included in the 5-year plan for 1986-1990, chiefly because of the foreign currency expenditure involved and a move away from the excessive imports of the previous 5-year plan.

The French company Framatome and the West German firm KWU have already conducted detailed negotiations with China on this project.

China had originally planned to build 10 nuclear power plants with 1,000 MW capacity each by the year 2000.

China exploded its first atomic bomb in 1964 but still does not have a nuclear power plant in operation. It is building the power plant at Qinshan without foreign assistance, but requires foreign technology for construction of larger plants.

Mr Liu said that when the Daya Bay plant starts up, security guarantees, including those covering environmental protection, would be at a level comparable to those governing the operation of nuclear power plants in Western countries.

The official also stressed that one of the tasks of his ministry would be to redeploy to the civilian sector more than 10,000 researchers and technicians who had been working since the 1950's on developing the country's nuclear arsenal.

Most Chinese nuclear exports were trained in the Soviet Union before the rupture between the two communist giants in 1960.

Some 60 percent of production of China's nuclear industry is currently used in the military sector, but the civilian sector's share is due to rise from 40 to 60 or 70 percent over the next 5 years, the official said.

Products for civilian use manufactured by China's nuclear industry are being featured at the China Shenzhen Technology Fair which runs until 20 April in this southern special economic zone.

More than 200 products manufactured by 80 companies dependent on the nuclear industry ministry are on display at the fair.

DESIGN, BUILDING DETAILS OF QINSHAN POWER PLANT PRESENTED

Chengdu HE DONGLI GONGCHENG [NUCLEAR POWER ENGINEERING] in Chinese Vol 6, No 6, Dec 85 pp 481-489

[Article by Ouyang Yu [2962 7122 0056]]

[Text] I. Introduction

The Qinshan Nuclear Power Plant is a Chinese-designed and Chinese-built prototype power plant; its rated power output is 300,000 kW. After completion, it will be linked to the East China power grid. It is expected that through the research, design, construction, and operation of this nuclear power plant, China's nuclear industry will benefit in terms of improving its organization, acquiring experience, training personnel, and becoming systematically more proficient in nuclear power technology. Furthermore, it will also facilitate the assimilation of foreign nuclear power technology. Therefore, this project is of paramount importance with regard to both scientific technology and China's economic development.

II. Description of the Plant Location

The power plant is located in Qinshan, Haiyan County, Zhejiang Province; it is 126 km from Shanghai by highway and 92 km from Hangzhou. To the northeast of Qinshan is Hangzhou Bay; the main peak has an elevation of 185.5 m. To the north are low hills which can be flattened so that the main building of the plant will be situated on a rock foundation. To the northwest of the main building is a stretch of beach; a 9-meter-tall, 1,780-meter-long dyke will be constructed in a northwest-southeast direction to enclose 566,000 m^2 of land for auxiliary buildings such as waste solidification treatment plant, air supply, steam supply and cooling facilities as well as spare parts and repair shops. Fangjiashan to the west of Qinshan can be used for future expansion.

The region surrounding the plant has a very stable geological structure; the rock layer where the main plant is located has a slope of 18 percent. The compressive strength of the lock is greater than 10,000 kg/cm^2. The beach area is made of sludge particles and subclay; its load capacity is approximately 8 tons/m^2. The hydrological and geological conditions of the terrain near the plant are relatively simple. The base is made of molten rock which has poor permeability. The average temperature in this region is 15.8 C; the historical low temperature recorded is -10.8°C, and the high is 38.1°C. The average rainfall is approximately 1,076 mm. The prevailing wind direction is east-southeast; in the summer, typhoons may bring severe storms with wind velocities as high as 32.2 m/sec.

In terms of hydrology, Hangzhou Bay is a semi-enclosed area with typical characteristics of a river outlet. The tides rise and fall twice per day, and the average temperature is 18.1 C. The cooling water for the condenser is taken from the nearby trough along the seashore and the warm water is returned to the bay. Because of the large tidal velocity (3-4 m/sec), the ejected warm water is thoroughly dissipated. Fresh water is taken from the Changshan Canal located 10 km from the plant; there is an ample supply of fresh water because the canal is connected to Tai Hu, and the Grand Canal, and the Huangpu Jiang.

Population distribution. The population distribution and population density within a 50-km radius of the plant are shown in Table 1. As is well known, the East China region is China's most populous region; compared to the surrounding regions, the population density near the plant location is relatively low, particularly within an area 20 km from the plant. For example, the average population density of Zhejiang Province is 376 persons/km^2, which is higher than the average population density in an area 30 km from Qinshan; the average population density of the 11 neighboring counties is 569 persons/km^2, which is higher than the average population density in an area 50 km from Qinshan (500 persons/km^2).

Table 1. Population Distribution and Population Density Within a 50-km Radius of the Qinshan Power Plant

Distance km	4—0.5	0—1	0—2	0—5	0—10	0—15	0—20	0—30	0—40	0—50

Population density	0	91	224	236	274	256	2[illegible]4	308	418	500

The power generator of this power plant consists of three major segments: the pressurized-water reactor (PWR), the primary circuit system, and the secondary circuit system (Figure 1). The cooling water for the reactor and the primary circuit is under a pressure of 155 kg/cm^2 and has an average temperature of 302 C. The nominal thermal power of the reactor is 966,000 kW at a nominal flow rate of 24,000 tons/hr; it is expected that with sufficient operational experience, it can be increased to 1.035 million kW. The flow rate of steam in the secondary circuit is 1,870-2,020 tons/hr, and the pressure is 53.0-56.5 kg/cm^2. The steam can produce 300,000-330,000 kW of power.

1. Reactor

The reactor unit consists of the reactor core, the reactor interior members, the pressure shell and the control rod drive mechanism (Figure 2). The reactor core is a structure which has 121 fuel elements arranged in a square array with a near-circular cross section. The water-to-uranium ratio in the reactor core (V_{H2O}/V_{NO2}) is 2.0653; the total capacity of NO_2 is 40.744 tons.

8. air evacuation unit

The first reactor core has three different concentration levels (2.4 percent, 2.672 percent, 3 percent), and the subsequent balanced refueling elements have a concentration level of 3.4 percent. The fuel rods are arranged in a 15x15 square array with 13.3 mm separation between two neighboring rod centers. The shell is made of Zr-4 alloy pipes with 10-mm outside diameter and 0.7 mm wall thickness.

During the design, a series of experiments were conducted to determine the physical, thermodynamic, hydraulic and material characteristics as well as the mechanical properties of the reactor core and the fuel elements in order to verify the reliability of design and to make design improvements based on the test results.

Two different approaches are used in the reactor to control reactivity: the use of bundle type control rods and dissolved boron. The drive mechanism for the control rods is magnetically operated, and has been tested for over 10,000 m continuous travel. Its performance has been demonstrated in terms of wear-resistance, endurance and reliability.

The interior members of the reactor are used to position the reactor core and to guide the coolants through the reactor core; they are also used to guide the 37 bundles of control rods. In addition, 41 thermocouples (for measuring

the exit coolant temperatures of the fuel elements), 30 neutron flux measuring tubes and 8 radiation monitoring tubes are installed.

The pressure shell is made of SA-508-III steel, with semi-spherical enclosures on both top and bottom. It is 10.705 m in height, the outside diameter of the cylinder is 3.732 m, and the wall thickness is 175 mm; its design is based on U.S. ASME standards. The pressure shell has two major components: the cover and the cylindrical container, which are joined together with bolts and sealed with two concentric O-rings. The entire shell is made of forged parts to avoid weld lines in the longitudinal direction. In order to minimize embrittlement of the weld lines due to neutron radiation, they are positioned so that direct exposure to the reactor core would be avoided. During the design, stress analysis of the pressure shell was performed using the method of finite elements; also, electric tests and photoelastic tests of a 1:4 scale steel model and a 1:10 scale plastic model were conducted. These analyses and tests showed that the designed pressure shell exceeded the pressure requirements of the ASME-III specifications with ample margin. The pressure shell was manufactured by the Mitsubishi Engineering Co of Japan; Mitsubishi had verified and approved the Chinese design.

2. Primary Circuit System

The primary circuit system consists of two parallel loops. Each loop contains a steam generator and a main coolant pump, which are connected by No 316 stainless steel pipes to the reactor to form a closed circuit. In addition, the system has a pressure stabilizer and pressure relief tank as well as instruments and valves required for operation control and safety.

The steam generator is of vertical inverted U design; its upper section has a 3-stage vapor/water separator. The separator has been tested using moist, hot steam; the separated steam is 99.9 percent free of moisture, which exceeds design requirements.

The main pump is a vertical, single-stage, single-speed mixed type sealed-axle pump. The axle has three mechanical seals; if any stage fails, the remaining stage(s) will still be able to withstand the pressure in the system. The main pump is designed and built by the KSB Pump Factory of West Germany according to our specified parameters and requirements.

The pressure of the primary circuit is regulated by the pressure stabilizer. The electric heater, the atomizer and other equipment of the regulation system have been tested repeatedly for performance and reliability. The top section of the pressure stabilizer is equipped with three electromagnetic pressure relief valves and two safety valves to protect against over pressure.

In addition to the main system, the primary circuit has 16 auxiliary systems. Functionally, they can be divided into the following categories;

(1) Systems to ensure normal operation and porper starting and stopping of the reactor and the primary circuit; they include the chemical volume system, the boron retrieval system, the sealing system of the main pump axle, the water

disposal system, the cooling system for the equipment, the cooling system for removing residual heat after reactor shut-down, and the ventillation system for the workshop.

(2) Systems to protect the reactor and the primary circuit when loss of water occurs, to contain the effects of an accident, and to prevent scattering of radioactivity into the environment; they include the safety injection system, the safety sprinkling system, and the hydrogen removal system.

(3) Systems to retrieve and process radioactive materials to protect the environment; they include the collection, purification and storage systems for waste gas and liquid waste, and the solidification system and processing system for liquid waste and solid waste.

3. Secondary Circuit System

The main component of the secondary circuit is the steam turbine-generator unit. The steam turbine is a single-axle, three-cylinder, four-exhaust condensation type saturated steam turbine. The generator is a dual-water, internally cooled, brushless excitation, three-phase, a.c. generator. Its terminal voltage is 18 kV, and its rotational speed is 3000 rpm.

Between the high-pressure cylinder and the low-pressure cylinder of the steam turbine are two heaters which are designed to remove the moisture and raise the temperature of the steam. When the turbine pressure increases due to sudden loss of load, 70 percent of the steam will be exhausted rapidly into the condenser to avoid excessive shock on the reactor due to the load change. In case of a crack in the main steam pipe, the steam flow rate will be limited by the flow limiter located at the exit of the steam generator in order to minimize the effect of excessive cooling of the reactor due to the loss of steam.

Since the cooling water used in the condenser is sea water, the heat transfer pipes and plates are made of titanium. Also, to ensure the quality of the water supply, the condensation water will be subject to 100 percent salt removal.

IV. Safety Design Measures

Safety has always been the No 1 consideration in the design of this power plant; the first priority is safety, not high performance. In conjunction with preliminary design, preliminary safety analysis and evaluation of environmental effect were also conducted, and accident prevention measures and emergency procedures were established. Safety design measures are generally based on the international standards used in the late 70's. They are also in compliance with the Chinese safety standard "Radiation Protection Regulations."

1. Safety Design Guidelines

The safety design follows the four guidelines described below.

(1) Eliminate possible causes of accident. A good design and superior engineering quality are pre-requisites for ensuring safety. This power plant is equipped with many levels and many different types of safety devices. Sufficient safety margines are provided for critical materials and critical components, and strict quality inspections are conducted to minimize the possibility of accidents.

(2) Prevent conditions of abnormal operations from developing into catastrophic accidents. Multiple levels of independent safety protection and control systems are installed so that when operational parameters exceed their design limits, alarms will be activated and power output will be automatically reduced until the reactor is shut down. Constant monitoring and periodic inspection will be carried out; procedures will be established for safe operation, particularly procedures to prevent abnormal operating conditions from developing into major accidents.

(3) Minimize damages in case of an accident. Accident correction measures are taken for every possible cause of accident in order to prevent radioactive materials from polluting the environment. In addition, effective protective measures must be taken to guard against possible natural disasters such as earthquakes, tides, floods, and typhoons, to ensure that safety-related structures, systems, and equipment will not be damaged and fail to function.

(4) Close monitoring of radiation dosage and radiation protection. Radioactive waste treatment and purification systems, dosage monitoring systems, and protective shields are installed in order to control and ensure that the radiation level released during normal operation and in case of an accident will be lower than the allowable levels specified in the standards 10CFR20 and 10FR100, and in China's Radiation Protection Standards, so that the safety of operating personnel and local residents can be guaranteed.

2. Safety Measures

The following safety measures are taken in the design:

(1) The reactor has negative-response temperature coefficients. In order to maintain good stability during operation of the reactor, and to limit boron concentration in the coolant, burnable poison rods are installed during initial loading of the reactor core, so that the temperature coefficients of the moderator under various operating conditions and all negative. Specifically, these values are as follows:

At initial fuel loading $\alpha_m^{\circ} = -1\times10^{-5}/^{\circ}C$

$\alpha_m^{HFP} = -7\times10^{-5}/^{\circ}C$

Before first refueling $\alpha_m^{HFP} = -5.19\times10^{-5}/^{\circ}C$

(2) Sufficient margin is provided in the thermodynamic design. The calculated coefficient of power non-uniformity of the reactor based on physical zero-power inspection procedure is 2.54; to provide adequate safety margin, the coefficient for thermodynamic design is chosen to be 2.9.

(3) Protective screens are installed to prevent radioactive materials from escaping. Three individual screens are installed for shielding the fuel elements, the pressure shell and the primary circuit, and the safety shell.

(i) Fuel elements. The fuel elements are made of UO_2 core blocks which have high melting point and very stable chemical properties. The total hydrogen content in the core block is limited to less than 2.5 ppm in order to minimize fracture due to hydrogen embrittlement. The mechanical structure of the fuel elements has been tested for mechanical strength, water corrosion, hydraulic surge and hydraulic vibration; it is now undergoing radiation tests.

(ii) Pressure shell and primary circuit. The mechanical design of the pressure shell, the primary circuit and auxiliary systems has adequate safety margin. All metallic surfaces in contact with the coolant are made of austenite stainless steel or high-nickel alloys; the quality of water in the primary and secondary circuits is strictly controlled to minimize corrosion. The structural materials, the weld lines and the reactor weld layers of the components and support members have been subject to non-destructive tests according to ASME Class-I technical standards; they are also subject to periodic inspection during operation in order to discover hidden defects and take timely corrective measures.

(iii) Safety shell. The safety shell is a pre-stressed concrete structure which can withstand the combined load of 1.4 times the peak pressure under loss-of-water conditions plus its own weight, the pre-stress, and the temperature stress. This combined load is supported by several hundred bi-directional pre-stressed steel bars. The entire shell structure has been subject to detailed stress analysis, and conventional steel ribs have been installed based on the analysis results to reinforce the structure, so that the safety factor of structure under pressure loads of an accident is no less than 2.0.

Sealing of the safety shell is accomplished by the steel rib lining on the inner surface. The strength and stability of the steel lining have been carefully analyzed under the pressure load of an accident, temperature pressure, and pre-stress. The several hundred tubes which penetrate the safety shell must also meet very strict sealing requirements. After completion, the safety shell will be subject to strength test and overall leakage test. Under design pressure, the allowable leakage rate is one-one thousandth of the total weight of air inside the safety shell in a 24 hour period. The leakage test will be repeated every few years after the plant begins operation.

(4) Reactor safety protection system. The reactor has 37 bundles of control rods, which can be inserted into the reactor core in 2 seconds under gravity. When the operating parameters exceed their design limits and there is a possibility of endangering the pressure boundaries of the reactor core and the primary circuit, the automatic reactor shut-down signal will cause the control rods to be lowered to provide sufficient depth of thermal shut-down. When shut-down occurs, a signal is generated to stop the steam turbine at the same time.

(5) Special safety measures. In order to prevent reactor core melt-down and to prevent the release of radioactive materials into the environment due to loww of water in the primary circuit or fracture in the main steam pipes. the power plant is equipped with special safety measures which include the following systems:

(i) Safety injection system. The system has four high-pressure safety injection pumps, two low-pressure injection pumps and four safety injection tanks. In case of an accident, the high and low pressure safety injection pumps will inject boron water into the reactor core according to pressure variations in the primary circuit. When the pressure drops to 50 atg, the four safety tanks automatically inject boron water into the reactor core.

(ii) Safety sprinkling system. The system has two safety sprinkling pumps. When the internal pressure of the safety shell rises to 1.5 atg due to loss of water, the sprinkling pumps are activated and boron water containing NaOH is sprayed into the safety pump.

(iii) Safety shell isolation measure. In the case of loss of water in the primary circuit or fracture of the main steam pipes, a safety shell isolation signal is generated in addition to the safety injection signal (isolation of all the conduits except the steam pipes, water supply tubes, and ventillation system conduits). The main steam pipes and water supply tubes are isolated when a special signal indicating fracture of the main steam pipes is generated; the ventillation system conduit of the safety shell is isolated by a signal indicating high radiation level inside the safety shell.

(iv) Hydrogen removal system. The hydrogen removal system is designed to remove the accumulated hydrogen within the safety shell. There are two closed-loop systems each with a hydrogen removal capacity of 150 m^3/hour; each system contains a suction type blower, an air cleaner, and a catalytic hydrogen and oxygen composite remover. In case of an accident, the hydrogen concentration inside the safety shell can be controlled to below 4 percent by activating only one of the two systems.

(v) Safety air purification system. This system includes:

(a) a safety shell air filtering system, which can filter the air in the safety shell once every 4 hours to reduce the radiation level.

(b) safety shell cleaning and ventillation system, which is used for cleaning reactor personnel before entering the safety shell; its air replacement capacity is 1.5 times/hour.

(6) Reliable power supply. To ensure that the power plant will not lose electricity under any circumstances, three independent electric sources are installed for power supply. They include: two independent external sources from different transformer stations of a 220 kW power network. If the two external sources are cut off simultaneously, then the emergency diesel generator unit within the power plant is activated to supply power to the special safety facilities. There are three emergency diesel engines, each with a capacity of 2000 kW.

(7) Anti-earthquake measures. The anti-earthquake design is based on standards for nuclear power plants used by the U.S. and Japan. All structures, equipment and systems of this power plant are designed according to anti-earthquake specifications. Components which are directly related to the safety of the power plant are designated as class-I components.

The earthquake response spectrum of nuclear power plants specified by the U.S. Atomic Energy Commission are used in the design. Specifically, two reference intensities are assumed. One is the operational base earthquake (OBE), which is the maximum earthquake intensity that might be encountered at the plant location over the next 100 years; this value is consistent with the base intensity of scale 6 (AH∼.075g) approved by the National Earthquake Bureau. The other value is based on the maximum intensity at the plant location which had been recorded in history and which may be encountered in the future; this intensity plus one defines the safety shut-down earthquake (SSE).

For anti-earthquake and anti-fracture considerations, a 300-ton and a 40-ton pressure dampers are included in the system design.

In addition, specific anti-earthquake requirements are also used in designing various equipment as well as their supports and valves. Special analysis and calculations are performed for Class-I structures, equipment and conduits to eliminate any hidden concerns.

(8) Fire-fighting measures. The fire fighting system of the power plant is designed according to the No. 50-SG-D nuclear power plant fire prevention regulations of the International Atomic Energy Organization and the Chinese "Construction Design Fire Prevention Regulations" TJ16-74; the U.S. NRC Regulatory Guide 1.120 is used as a reference.

Non-combustible construction materials are used. For critical areas such as the control room, the electric cable compartment in the computer room, and the diesel engine room, fire-proof insulation screens are installed to provide fire resistance for more than 3 hours. The control room, the switch room and the transformer room are equipped with fire detection sensors which can automatically activate the alarm; they are also equipped with automatic fire extinguishing systems.

(9) Protective measures against floods, typhoons, and impact of external objects. The effects of tides and typhoons must be given serious consideration. Sea dykes are being built along the shore and will be connected to the existing dykes. The dyke design is based on considerations of high tides that occur once every hundred years and wave heights with corresponding frequencies; the design is verified using once-per-thousand-year high tides plus wave heights with once-per-hundred-year frequencies to ensure safety of the power plant.

In addition, loads due to typhoons, tornados and impact of external objects are also considered in the building design. Analysis results show however that these effects are all smaller than the earthquake loads.

(10) Lessons learned from the Three Mile Island incident. The following measures are taken in arranging the control room.

(i) The control room is arranged according to system functions; instruments for normal operation and emergencies and their respective controls are clearly arranged on the control console and the instrument panel.

(ii) Redundant arrangement is provided for critical instruments so that malfunctioning of one instrument will not lead to incorrect decision.

(iii) For added fire protection, an emergency control room is provided in addition to the main control room.

(iv) Safety-related equipment are located so that the operators can have easy access.

(v) Indicator lights are installed near the controls to attract the attention of operators when abnormalities occur.

(vi) CRT displays are utilized to enhance man-machine interaction, to indicate the status and parameters of malfunctions, and to direct the operators so errors are avoided.

(vii) Technical support centers will be established to provide direction and guidance in case of an accident without interfering with normal operation.

3. Accident Analysis

The accident analysis for this power plant is performed according to specifications of the U.S. standards ANSI-18.2, "Nuclear Safety Design Rules for Fixed Pressurized-Water Reactors."

On the basis of the expected frequency of occurrence and the degree of seriousness, accidents can be divided into three categories: (1) extreme accidents (postulated accidents which are not expected to occur); (2) major accidents (accidents which occur rarely); and (3) general accidents (accidents with medium frequency of occurrence).

To be safe, the accident analyses are carried out by assuming exagerated degree of seriousness and unfavorable conditions, without regard to the actual probability of occurrence of these scenarios. For example, in the case of an accident where fracture of pipes, earthquake, and loss of electricity all take place at the same time so that the reactor must be shut down, it is assumed that a bundle of control rods with the largest reactive value becomes jammed and cannot be inserted into the reactor core. The initial conditions and the physical, thermodynamic parameters are generally chosen to have the most unfavorable values under the particular operating conditions.

During the preliminary design phase, 6 extreme accidents, 7 major accidents and 6 general accidents were analyzed, with emphasis on the extreme accidents and major accidents. The computer programs used in the analyses were developed by the Shanghai Nuclear Engineering Research and Design Institute, with the exception of the imported RELAP-5 program, which was used for analyzing a loss-of-water accident in the primary circuit. The results of analyses were generally quite satisfactory. For example, a comparison of the analysis results and safety standards for two accident scenarios--dual fracture of the main pipe in the primary circuit and medium, small punctured holes in the pipe--is shown in Table 2. The analysis results for all accident scenarios considered met the specified safety standards.

Table 2. LOCA Accident Analysis Results

Safety standards	Analysis results	
	Dual fracture	Medium and small punctured holes
Maximum fuel rod temp. <1204 C°	= 1098°C	852°C
Zirconium-water reaction <10%	<1%	<1%
Max. thickness of zirconium oxide <17%	≤3.52%	negligible
Reactor core maintaining coolable geometric shape	yes	yes
	L-LOCA	RELAP-5

4. Evaluation of Environmental Effects

The treatment of gas, liquid, and solid waste and environmental protection for the power plant strictly follow the principle of "ALARL." The waste treatment system is generally identical to similar systems used in the U.S. Under normal operating conditions with no leaks in the heat transfer pipes of the steam generator, the concentration in the waste water is 2.05×10^{-9} Ci/L; the annual discharge is only 0.012 Ci (with the exception of tritium). When there is a leakage of 3.17 L/h from the steam generator and 0.5 percent damage to the fuel rods (extreme operating condition), the maximum concentration in the waste water is 2.2×10^{-8} Ci/L, and the annual discharge is 3.65 Ci. The waste water is diluted by the circulating water until the concentration is reduced by three orders of magnitude before it is discharged into the sea.

Similarly, by assuming extreme operating conditions, it is calculated that the effect of discharged waste water on the local residents is to produce a maximum dosage of only 0.03 mrem, the effect of discharged gas is 0.37 mrem, with a total of 0.4 mrem. This value corresponds to only 0.4 percent of the natural background radiation.

In addition, analysis of the radiation levels in the environment from 8 major accidents and extreme accidents showed that they are far below the threshold value given in the U.S. regulations 10CFR20 and 10CFR100. Therefore, the safety of the Qinshan power plant is reasonably assured.

V. Project Development

The development plan of this power plant was reviewed and approved by the late Premier Zhou Enlai in 1974. Since that time, significant amount of research and tests have been conducted, and a plant site has been selected. Of the planned research tasks, approximately 200 have been completed by mid-1982 (at the end of 1984, 220 have been completed), and Qinshan was selected as the site for the power plant. On this basis, preliminary design (including preliminary safety analysis) and manufacturing and procurement of equipment and components were initiated. The preliminary design was completed in October 1983, and was approved by the National Planning Committee in January 1984. Construction design has been underway for over a year, and is still continuing. In June 1983, work began in excavation, field preparation, dyke construction, and the construction of water supply, power supply, and roads; by the end of 1984, they were all completed. In January 1985, construction of the main plant was officially started, and factories in Shanghai, Beijing, Xi'an, and Dalian also began manufacturing of various equipment for the power plant. It is expected that construction will continue for 2 more years through 1986, installation will also take 2 years through 1988; test operation should begin in early 1989. If everything proceeds according to plan, the power plant is expected to begin generating power in the second half of 1989.

The author would like to express his thanks to comrades who are concerned, and who have provided guidance, support and assistance to the Qinshan project.

NUCLEAR POWER

CONSTRUCTION STEPPED UP ON QINSHAN, DAYA BAY POWER PLANTS

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 22 Apr 86 p 1

[Text] Beijing, 21 Apr (XINHUA SHE)--Progress on the project to construct China's first nuclear power plant--the Qinshan Nuclear Power Plant--has been rapid. The nuclear island, the heart of the power plant, stands like a colossus over the construction site.

According to a report in the Shanghai WEN HUI BAO, as of the middle of April the steel framework for the nuclear island had risen to a height of 31 meters, one-half of its overall [finished] height. Concrete for the nuclear island has already been poured to a height of 12 meters, or about 23 percent of the total to be poured. Work on the auxiliary building is well under way and work is progressing on the main control room, the seawater pumping station, the water intakes, and the waste material storage facility.

Located on the northern shore of Hangzhou Bay, the Qinshan nuclear power plant is 92 kilometers from Hangzhou and 126 kilometers from Shanghai. It is the first 300MW pressurized-water reactor power plant to be Chinese-designed and built, and is listed as one of the nation's major construction projects. Work on the main buildings of the Qinshan nuclear power plant began in January 1985. Tests are scheduled for 1989 and the plant could be feeding power into the grid that same year.

According to a CHINA NEWS AGENCY report from Guangzhou on the 21st, preliminary engineering work on the Guargdong nuclear power plant, which has been going on for 2 years, could be completed by the end of April [1986].

Preliminary engineering work on the Guangdong nuclear power plant at Daya Bay began in April 1984. Today, the 67-meter hill that used to be on the Daya Bay site has been levelled and a flat, broad plant area has now risen some 6 meters from an area reclaimed from the ocean that covers an area of 197 hectares. Construction of an immense stone and concrete block seawall that measures 1400 meters in length and 14 to 16 meters in height has commenced. A "water curtain" that is 1000 meters long, 80 centimeters thick, and 12 to 16 meters deep has also been finished. Already in use is a 1000-ton-capacity pier. A 4-meter-wide asphalt highway running some

28 kilometers from the Beizijiao border inspection station to the plant site has been finished. A newly built 35,000 volt transformer station assures a supply of electricity for the construction work. Telephone and radiotelephone links to Shenzhen are now open. A 1.3 million m^3 reservoir and its associated water works have been completed and pipelines are now being put down.

The Guangdong nuclear power plant project has been removed from the Ministry of Water Resources and Electric Power and placed under the authority of the Ministry of Nuclear Industry. A new management system is also being established. Currently, tenders are being invited for the civil engineering work on the basic work of the nuclear reactor.

SUPPLEMENTAL SOURCES

STATUS OF SOLAR ENERGY UTILIZATION RECAPPED

Beijing TAIYANGNENG [SOLAR ENERGY] in Chinese No 1, 28 Feb 86 pp 1-5

[Article by Liu Jianmin [0491 7003 3046], "The Situation in Developing the Use of Solar Energy at Home and Abroad"]

[Excerpt] Solar energy is a renewable energy source and it is inexhaustible. In the seventies, due to the world oil crisis, the use of solar energy attracted world attention, especially the use of solar energy heat and the sun's light to generate electricity and this has already become an important aspect in the developing uses of solar energy. To promote solar energy in China, the general situation in the development of the use of solar energy in China and abroad will be summarized below.

I. Development of the Use of Solar Energy in China

China began research in the fifties on such uses of solar energy as solar stoves, solar water heaters, and solar batteries. Nation-wide, there are at present 162 research units and over 3,000 scientists and technicians pursuing research units and over 3,000 scientists and technicians pursuing research on the use of solar energy, more than 50 plants produce equipment that uses solar energy, and a total of 40-50 million yuan has been invested by state and local governmental agencies. International academic exchanges concerning solar energy use are also increasing daily. Solar water heaters, solar greenhouses, solar stoves, solar houses, solar dryers, and solar batteries have gradually gone from laboratory research to small-scale application with good economic results.

A. Use of Solar Heat

Solar heat is the most important aspect of the use of solar energy in China today. In the past few years, the important projects which have been progressively promoted and applied are:

1. Solar Water Heaters

China began to develop this already in the fifties. Starting with the early seventies, the solar water heater was progressively promoted and used on a small scale in many places nation-wide. According to incomplete figures, by the end of 1984, the solar water heaters in use nation-wide exceeded 300,000 m^2. The range of uses, which initially were primarily for supply of low water temperature water for such public facilities as municipal bathhouses, barber shops, dining rooms, and hospitals, has progressively expanded to swimming pools and such industrial and agricultural production as low-temperature fermenting, washing of industrial products, and hot water supply to dairies.

The current average thermal efficiency of hot water heaters being designed and produced in China is 40-50 percent, their price and life expectancy vary depending on materials used, but the maximum price is approximately 100-200 yuan/m2, and the life expectancy is generally 2-5 years.

2. Solar Stoves

China began to develop these in the fifties. According to incomplete statistics, by the end of 1984, there were 90,000 solar stoves nation-wide, and China uses more solar stoves than any other country in the world. Of this number, 40,000 are in Gansu Province, 15,000 are in the rural areas of Hebei Province, but of this number, probably one-third are defective and abandoned.

3. Solar Greenhouses

In the past few years, due to developments in the plastics industry, various types of solar plastic heating tents have been built across the northern and southern regions of China. Their uses have expanded from horticulture to cultivating vegetables and melons and such crop seedlings as cotton and paddy rice, and gradually are used for raising poultry and domestic animals, and cultivating fish, shellfish, and silkworms, all with good results.

By the end of 1983, China had already extended solar greenhouses of various structures and solar plastic tents of various kinds to over one million mu. We will now summarize the developmental trends in use and management.

a. Solar greenhouses for cultivating vegetables. This is the major application of solar greenhouses in China and over 50 kinds of fresh vegetables are cultivated. In high plains regions, the economic benefits are especially clear. These greenhouses cost approximately 3 yuan per square meter to build. For example, the Weidong Office in Lhasa built a plastic greenhouse which covered a half a mu, there are three crops per year consisting of 130,000 catties of cucumbers per crop, which sell for 3,900 yuan, and one crop covers the total investment.

b. Solar-powered fish culture. The Hengshui Special District, Hebei, Acquatic Products Experiment Station uses solar greenhouses to raise fish and after 8 years of tests, the maturation rate of the fry is 99.5 percent, which is a 30-50 percent improvement over coal-heated greenhouses.

c. Solar-powered shellfish culture. The Tianjin Solar Energy Technology Research Conference converted a 240 m^2 artificial prawn hatchery from using conventional energy sources for cultivation into a solar green house and by using a solar water heater to raise the temperature of the pond water, with the addition of appropriate supplemental electrical heat, moved up the cultivation of prawns in the north by one month and since the autumn crop could be lengthened to 12 cm, it raised the export value of the prawns.

d. Solar-powered hotbeds. These are mainly used for growing spring season seedlings, cultivating winter season vegetables, overwintering of flowers and grasses, vegetative cultivation of cotton seedlings, forcing paddy rice, overwintering of old sweet potato vines, and winter seed protection and breeding in breeding enterprises. Experience proves that by using this type of bed for growing seedlings, the survival rate is higher, the seedlings are more robust, and generally output is increased 6-15 percent.

e. Solar-heated enclosures for raising domestic animals. This can increase the number of sow farrowings from two litters per year to five litters every 2 years; it ensures the normal growth of fattening pigs. It has now been extended to raising milk cows and lambing sheep. Because of its technical simplicity, clear benefits, and low cost, it is being promoted in Shanxi and Neimeng.

4. Solar Houses

China's first passive solar house was built in 1977. According to incomplete statistics, by the end of 1984, over 130 solar homes of different designs have been built nation-wide. Most of them use trombe walls or heat collecting walls.

The energy saving effectiveness and additional investment for China's solar houses varies depending on the region and building style.

When the average outdoor temperature in January was -10°C, the Minqin solar house in Gansu Province, could maintain an indoor temperature above 16°C, with a solar energy supply rate of approximately 80 percent, and a construction cost per square meter generally 10-12 yuan higher than equivalent ordinary houses. The Quanji solar house in Qinghai has a total area of 126 m^2, with a heating area of 57 m^2, and the added investment for using solar heating was 3,000 yuan. When the air temperature outside is -15°C, without using the supplemental heat source at all, the inside temperature can be maintained above 10°C, with an annual saving of 12 tons of coal and at current coal prices the investment can be completely recovered in 3 years. At the Yihezhuan solar house test project in Daxingxian, Beijing Municipality, the interior temperature during the winter without using supplemental heat generally was not lower than 8°C, with a solar energy supply rate over 60 percent, had an added cost of 25 yuan per square meter.

Generally speaking, the usual winter heating temperature in China's solar houses can be maintained at 8-12°C, which meets the demands of the general rural lifestyle, the solar power supply rate is 50-80 percent, and the added investment per square meter is 10-25 yuan.

5. Solar Dryers

China began research on solar powered drying technology and by the end of 1983, over 50 solar dryers with an area of 3,000 m^2 had been constructed nation-wide. They are used for drying such crops as grains, fish, tobacco, rolled bean milk cream, fruits, wood, hides, Chinese medicines, rubber, and natural silk, with good economic benefits. Currently, the better solar drying facilities includes the following.

a. Solar fruit drying facilities. The lichee and longan solar dryers of the Dongwanxian Fruit Processing Plant in Guangdong have a total area of 59 m^2. The drying time reduced by two-thirds over that of traditional drying methods, saving energy as well as improving product quality, so that the product can reach the special class or first class standard. The investment per square meter in this facility was 150 yuan, and the total investment can be recovered in 1-3 years.

The solar hongzao [4767 2764] drying facilities of the Taocun Brigade of Houshanxian, Shanxi, can save a standard ton of coal in drying 1 ton of hongzao.

b. Solar curing facilities. The investment in a 213 m^2 solar rabbit skin curing facility in Hebei was 180,000 yuan recoverable in a year. Experience proves that compared with natural drying or tedding, rabbit skins are cleaner when dried in a solar dryer, the drying time is shorter by two-thirds, and the losses can be reduced.

c. Solar tobacco-drying facilities. Ordinarily, drying 1 ton of tobacco requires 1 ton of coal. In Henan alone, the annual consumption of superior coal for drying tobacco is more than 1 million tons. But using solar energy for drying tobacco can both improve the quality of the tobacco and also save a great deal of coal.

d. Solar wood drying facilities. The solar-powered infrared wood drying kiln of the Yuncheng Municipal Wooden Articles Plant in Shanxi has a capacity of 7 m^2. The results of operation show that, compared with drying in coal-fired kilns, drying costs dropped from 22 yuan/m2. Total investment is recoverable in 3 years and at the same time the quality of the wood drying is improved.

6. Solar-powered Sea Water Desalinization Facilities

The Guangzhou Energy Institute of the Chinese Academy of Sciences has built solar-powered sea water desalinization facilities at Hainan, Zhongjian Island in the Xisha, and in Zhejian.

7. High-temperature Solar Furnaces

In 1978 the Hai'anxian Solar Energy Institute of Jiangsu developed a solar furnace with a focal diameter of 30 mm, and a focal center temperature of more than 2,000K which can be used for welding. The South China Engineering

Engineering College developed two solar furnaces, mainly for materials testing, which have a maximum focal temperature of 3,000°C.

8. Solar-powered Air Conditioning Facilities

In the past few years, some of China's scientific research units have carried out scientific research on solar-powered refrigeration and ventilation and have obtained some operational experience, but it is still quite far from practical use. The Guangzhou Energy Institute of the Chinese Academy of Sciences has cooperated with the Hong Kong College of Science and Engineering to construct a demonstration solar-powered air-conditioned house in Shenzhen.

B. Solar-powered Photoelectric Uses

In 1958 China began conducting research on solar batteries. In 1971 solar batteries were successfully applied for the first time in the second satellite launched by China. In 1973 this technology was extended to ground applications, the first of which was the navigation lights in Tianjin harbor. Since then it has also been extended to applications in railroads, animal husbandry, communications, television, protecting crops and rubber, with clear results.

There are over 40 units in China pursuing solar battery research, among which most are studying single crystal, non-crystal, and multi-crystal silicon solar batteries, and a few studying solar batteries of chemical compounds, such as cadmium sulfide and gallium arsenide.

At present China has 17 plants which produce solar batteries. Annual productive capacity is above 100 kW, but actual production is 70 kW, and the products are primarily single crystal silicon solar batteries. The overall cost of solar battery products has dropped to 50-55 yuan-peak Watt, with photoelectric conversion efficiency at 8-12 percent, and life expectancy which can reach 10 years. By the end of 1984, the installed capacity of China's solar batteries was over 100 kW.

The applications of solar batteries nation-wide is primarily in the following areas:

1. Navigation Lights

Primarily in harbor routes in Tianjin, Shanghai, Guangzhou, and Chang Jiang. By the end of 1983, the overall power of silicon solar battery power supply used in navigation lights in all of China was over 7 kW.

2. Railroad Signal Lights

China's railroads have over 5,000 stations. Of this number over 1,500 stations do not have ac power supply or have unreliable ac power supply. By the end of 1983, nation-wide, 15 railroad bureaus had installed, at over 120 railroad stations, 280 silicon solar battery powered railroad signal lights. The overall power is over 8 kW.

3. Electric Fences

Electric fences powered by solar batteries to prevent loss of grassland is an ideal application. China has 3.3 billion mu of grazable grassland. Electric fences began to be used in 1979 and by the end of 1983, over 140 farms nation-wide were using electric fences. The overall battery power is 3kW.

4. Black Lights

By the end of 1983, there were over 200 applications nation-wide, with an overall battery power of 4 kW.

5. Battery Charging Power Supplies

By the end of 1983, the overall solar battery power of small battery chargers was 1 kW, the overall power used for television relay power supplies was 1.5 kW, the overall power used for yurt illumination was 8-9 kW. The Fukang Xian Solar Battery Charging Station currently under construction in Xinjiang Autonomous Region will have a maximum capacity of 5 kW.

6. Military Communications and Illumination

Maximum capacity of 3 kW.

Other applications of solar batteries include solar-powered rubber tapping lights, solar powered surgical lights, meteorological stations, rural carrier telephone power supply, oil pipeline and reservoir sluice gate cathode protection, forest fire monitor power supply, and irrigation pumps. In addition, the joint Chinese-West German 10-kW photoelectric station in Daxing Xian, Beijing Municipality, is used for photoelectric water pump water supply. The joint Chinese-Japanese 10-kW photoelectric station built in Lanzhou is used for illumination in rural homes.

C. Generating Electricity With Solar Heat

In the past few years, China has carried out some small-scale exploration in using solar heat to generate electricity. The Shanghai College of Machinery test-developed a facility for generating 1 kW of electricity by low temperature solar heat. Tianjin University built a tower-type solar-powered test power station designed with an output power of 1 kW.

The Xiangtan Electrical Machinery Plant is now developing with the U.S. Space Electronics Company a 5-kW focused solar-heat generating facility. The first model was put into trial operation in October 1984, but for a variety of reasons, it only generated 2 kW and did not reach the design standard. It is predicted that this facility is scheduled to be purchased by the UN at $50,000 per unit. After being developed, the Xiangdan Electrical Machinery Plant may produce 100 units per month. The second phase of cooperation in this project will change the present high-speed steam turbine generator to Sterling generators to improve the performance of the facility.

In view of the present situation, China's research on using solar heat to generate electricity is basically at a standstill.

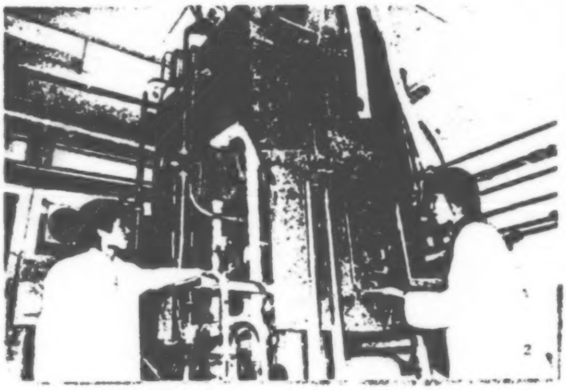
ENERGY INSTITUTE EXPLORES ALTERNATIVE ENERGY SOURCES

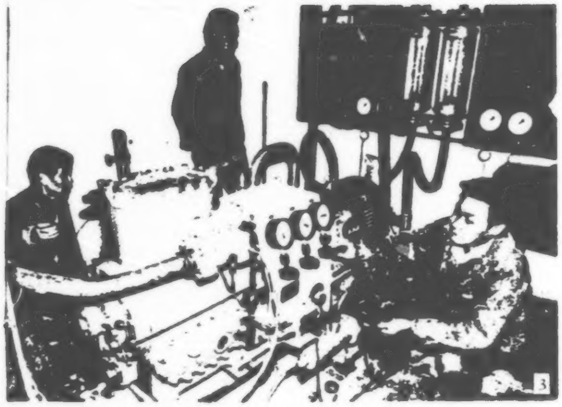
Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 3, 10 Mar 86, inside back cover

[Text] The Guangzhou Energy Institute of the Chinese Academy of Sciences undertakes research on new energy sources such as biomass, solar energy, geothermal energy, and ocean energy, as well as conventional energy conservation technology. The Energy Institute has 196 personnel, including 144 scientists and technicians. Since its establishment, the institute has made achievements in 23 areas of research and has won two National Science Conference awards. The Guangzhou Energy Institute, in order to resolve the energy problem that confronts the nation's economic growth, adheres to the scientific research policies that serve the national economy.

At left, Senior Engineer Huang Zhicheng of the institute "debugs" a solar heat collector. Expanding research on the application of solar heat has produced dryers, seawater desalinization units, refrigeration (air conditioning) equipment, and hot water heaters.

At right, an experimental facility that uses hot water as a heat source developed by the institute. It makes use of industrial waste water to produce the coolant needed for air conditioning.





Shown at left are research personnel experimenting with a heat pump to heat the water of a swimming pool. The installation, maintenance, and use of the heat pump are simple and it can save 70 percent of the electrical energy needed.

Shown at right are research personnel using a simulator to produce "waves" that would generate electricity. In this area of ocean wave energy research, the institute has developed China's first successful 10-watt navigation buoy.

BRIEFS

JIANGXIA STATION COMPLETED--Beijing, 17 Mar (XINHUA)--China's largest tidal power station has been completed in Jiangxi Harbor in Zhejiang's Wenling County. The station, named "Jiangxia Tidal Experimental Power Station," has an installed capacity of 3,200 kilowatts and is capable of generating 10 million kWh of electricity a year. It is the third largest tidal power station in the world. [Summary] [Beijing XINHUA Domestic Service in Chinese 1452 GMT 17 Mar 86 OW]

CONSERVATION

BRIEFS

6TH FYP CONSERVATION FIGURES--The State Planning Commission recently revealed that during the Sixth 5-Year Plan, the dual policy of energy development and energy conservation was completely successful, and the amount of energy conserved and saved was equal to 120 million tons of standard coal. Energy conservation accounted for half of the energy resources needed for the 10 percent average annual growth in the national economy. During the Sixth 5-Year Plan, every region, department and enterprise raised the management level of energy conservation work by establishing laws and regulations to strengthen basic work. We transformed equipment that consumed a large amount of energy, and we developed and popularized new energy-saving technology, techniques and new materials. In 5 years, we transformed more than 2,000 industrial kilns and furnaces, and recovered more than 4 million standard tons of coal in thermal resources. We added two thermal generators with an installed capacity of 600 MW, and we developed and popularized more than 1,000 varieties of wind generators and water pumps with a 1970's international technology level. By strengthening management and technology measures, the level of energy consumption of two-thirds of major energy-consuming products decreased. For example, the amount of coal required for steel smelting decreased 14.2 percent. Most rural areas increased the use of energy-efficient coal stoves, methane, etc., to conserve firewood. During the Sixth 5-Year Plan, the amount of energy conserved and developed in rural areas was equal to more than 20 million tons of standard coal. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

FORMATION OF RATIONAL PRICE SYSTEM REVIEWED

HK271150 Beijing JINGJI YANJIU in Chinese No. 3, 20 Mar 86 pp 56-69

[Article written by Lin Wenyi [2651 2429 4135] of Chinese People's University and Jia Lurang [6328 1462 6245] of Financial and Trade Materials Economic Research Institute of Chinese Academy of Social Sciences in January 1986: "An Inquiry into the Rational Price System"]

[Text] The reform of the price system is the key to the smooth development of the national economy and to the success or failure of the reform of the entire economic system. Then, what is the rational price system, and what is its theoretical basis? We hold that the theory of the formation of the planned price is the theoretical basis for the formation of the rational price system. There are three essential factors for the formation of the planned price: Value, the relations between supply and demand, and policy factors. With regard to value, it is necessary to consider the value of the currency and its changes as well as the value of the commodities and its changes. In addition, under the condition that paper currency is in circulation, it is also necessary to consider the value the paper currency represents. With regard to the relation between demand and supply, it is necessary to consider both the conditions of demand and supply and their short-, medium-, and long-term trends of development. As for policies, it is necessary to utilize fully the objective functions of the economic laws of commodity to implement specific policy intentions such as the adoption of high price policy, low price policy, such as the adoption of high price policy, low price policy, protective price policy, fixed price with subsidies, and so on. This should be done in conformity with the requirements of the socialist economic laws as well as the laws governing the commodity economy. Therefore, when fixing or adjusting prices, the first thing to do is use the value as the basis, and the fluctuation of prices should be based on the changes of value; second, the degree of price approaching or departing from value should be based on the conditions of demand and supply, and the rise or fall of price should be based on the changes of the relation of demand and supply; third, the policy requirements should be implemented on the above basis, and the price should be fixed in accordance with the extent of objective economic laws. Only when the planned price is formed in this way can the price be rational. Since the price system is a unified system formed by various planned prices on the market according to an inherent and comparable relationship, naturally the rational price system should employ the rational planned prices as units. In other words, the essential factors formed by the rational planned prices are the essential factors on which the inherent and comparable relationship in the rational price system can be established.

If this analysis is correct, the formation of the rational price system should should consist first of a rational relationship of value ratio, which reflects the objective requirements of the law of value, and second of the relationship between supply and demand of commodities, which reflects the requirements of the law of demand and supply, and third of the policy requirements toward commodities. The aim is to utilize fully the price levers to raise the social economic results and to expedite the realization of the aim of socialist production. Therefore, the formation of the rational price system should reflect both the requirements of the laws of commodity economy and the requirements of the economic laws of socialism; and in the laws of commodity economy, it should reflect both the requirements of the laws of value and the requirements of the laws governing demand and supply.

A prevalent view is that "the price should conform with the value." When discussing the irrational things in our existing price system and elucidating the necessity of reforming the price system, people often come to the conclusion that the price departs from the value. When proposing the establishment of a rational price system or setting up a standard for evaluating the price system, people often use as the criterion of whether the price conforms with the value, while excluding the relationship between supply and demand and the policy requirements. In particular, the relationship between demand and supply is often regarded as the cause forming the irrational price system, as if the relationship between demand and supply would make the price depart from the value. Some people simply hold that the rational price system should be based on the requirements of the laws of value. Although some people admit that the relationship between demand and supply should be taken into account, they still think that the law of supply and demand is not a separate law independent of the law of value, and that its entire content is already included in the law of value.

As a matter of fact, in our existing planned prices, there has long been the phenomenon of comparatively higher prices for long-term products and comparatively lower prices for short-term products. This violates the law of supply and demand, leading to long-term products becoming longer and short-term products becoming shorter. For some commodities, the relationship between supply and demand has changed greatly and significantly, but the prices remain the same for a long time. Therefore, it is one-sided to treat the irrational things in the price system as only the departure of the price from the value.

It is obvious that a rational price system depends first on a rational ratio of value. However, the two are not the same thing, and a rational ratio of value should not be regarded as the only basis for a rational price system. In fact, the formation and movement of price are restrained not only by the law of value, but by the law of supply and demand. When supply fails to meet demand, prices rise; when supply exceeds demand, prices fall. The rise of price can stimulate the development of production and the increase of supply, while inhibiting demand; the fall of price can stimulate demand, while inhibiting production and supply. This is independent of man's will. Since value can be realized through the market, the form of expressing value -- the price -- cannot but be restrained by the market's environment and condition (primarily the relationship between supply and demand). In order for price to conform with value, demand and supply must be in a state of equilibrium, it is certain that price will department from value; and price can conform with value only when demand and supply are balanced. This is a true expression of the law of supply and demand, and it should be taken into consideration when formulating or adjusting prices. In reforming the price system, if the ratio of value is taken as the only basis for fixing price with the aim of making price conform with value in every possible way, this is in fact amounts to the negation of the law of supply and demand and treats the law of value as the only basis. This means that the price is made to conform with the value even if the imbalance of demand and supply is quite obvious, resulting in the difficulty in establishing a rational price system. When supply fails to meet demand, the price should be higher than the value, so that production can be promoted, supply increased, and demand inhibited, and a state of balance can be achieved; under this condition, if the price is made to conform with the value, the state of supply failing to meet demand will become even more serious. On the other hand, when supply exceeds demand, the price should be lower than the value, so that production can be inhibited, supply decreased, and demand stimulated, and a state of balance can be achieved; under this condition, if the price is made to conform with the value, the state of supply exceeding demand will become even more serious. This will violate the law of supply and demand. The objective law is independent of men's will. If the planned price is arbitrarily made to conform with the value, the fluctuation of the spontaneous price (the black market) will become even more drastic. Therefore, a rational price system cannot be established if only the law of value is taken as the basis, the price is made to conform with the value, and the price system is established in accordance with the ratio of value.

A rational price system should take into consideration not only the requirements of the law of value, but also the law of supply and demand. Only when the planned price can reflect the requirements of the law of supply and demand is it possible to balance supply and demand and make the price conform with the value as much as possible. Hence, when the price system is irrational and many prices depart from their value, we should not rashly and indiscriminately make the price conform with the value. On the contrary, more importance should be attached to the functions of the law of supply and demand and the departure of the price from the value should be utilized to balance demand and supply, and this is what is needed in achieving a rational price system.

There are now comparatively more prices that depart from their value; these prices should not be indiscriminately called irrational prices. First, this is caused by the above market situation; second, the phenomenon of prices departing from value should be analyzed -- some are rational and some are irrational. Prices higher than their value under the condition of supply failing to meet demand are rational; prices adequately lower than their value under the condition of supply exceeding demand should be maintained. Irrational departure means: 1) prices departing from value under the condition of mainly balanced demand and supply; 2) under the condition of unbalanced demand and supply, prices lower than value for commodities the supply of which fails to meet the demand, but prices higher than value for those commodities the supply of which exceeds the demand; 3) under the condition of unbalanced demand and supply, prices higher than value too much or too little for those commodities the supply of which fails to meet the demand, or prices lower than value too much or too little for those commodities the supply of which exceeds the demand. All these should be adjusted. The extent of departure of price from value should be appropriate. Therefore, the problem does not come from the law of supply and demand, which has nothing to do with the irregularities in the price system. The problem lies in whether the requirements of the law of supply and demand are correctly reflected and on whether the prices are correctly formulated or adjusted in accordance with the conditions of demand and supply and their trend of developments.

The law of supply and demand is the law peculiar to the commodity economy and is a basic law in the circulation of commodities. So long as there is circulation of commodities, there exists the law of supply and demand. Furthermore, commodity economy does not belong to capitalist society alone, and it exists extensively and develops in socialist society. Hence, the law of supply and demand also exists and functions objectively in socialist society. The law of supply and demand must not be regarded as a law destined to function spontaneously. Just as the law of value can be understood and consciously utilized in socialist society, the law of supply and demand poses no exception. Therefore, we should never think that a rational price system can be established only on the basis of the law of value and according to the ratio of value, and should not erroneously think that the price system would be affected if the law of supply and demand is taken into account. The idea that the law of supply and demand is a spontaneous economic law is in fact to pit this law against the planned price and therefore the rational price system, and to regard the relation between demand and supply as a spontaneous factor that affects the planned price. The contrary situation is that without consciously understanding and utilizing the law of supply and demand, the planned price cannot be satisfactorily formulated or adjusted and a rational price system cannot be established.

For a long time in our country, owing to the divergence of theoretical understanding, either the objective existence of the law of supply and demand was not recognized, or it was arbitrarily included in the law of value without acknowledging its independent existence. Up to now, the former understanding has been on the decline, but still quite popular is the latter, which regards as the expression of the function of the law of value all these phenomena: The fluctuation of the price under the influence of supply and demand which relfects that the value is the axis of the price movement; the phenomenon of the price moving toward or departing from the value. As a matter of fact, the requirement of the law of value is that the price should conform with the value determined by the social requisite time of labor; the value determines the price, and requires that the price should fluctuate around the axis of the value. However, the law of supply and demand requires that the price should fluctuate along with the changes of demand and supply and rises and falls with the change of conditions of demand and supply. The relationship of demand and supply cannot determine the value and cannot determine the condition governing the changes of the price around the axis of value. However, it can determine the rise or fall of prices, which makes it possible for this relationship to affect the movement of the price toward value or the departure from the value. The law of supply and demand and the law of value are two different things. One forms the basis for price; and the other determines changes of price. The association between them is that the functions of the law of supply and demand lead to the change of price, which makes the price fluctuate around the value. Hence, the function of the law of value must depend on the function of the law of supply and demand for its implementation. Furthermore, the association between the law of value and the law of supply and demand does not obliterate the difference between them, and the law of supply and demand can in no way be included into the law of value. We cannot negate the fact that the law of supply and demand is also a basis for establishing a rational price system, and we cannot regard the law of value as the only basis.

A rational price system should not only base itself on the requirements of the law of value and the law of supply and demand, but should also take into consideration the requirements of policy. Since we want to establish a socialist system of planned prices, we have to consider socialist principles as well as the laws governing the commodity economy. In other words, the price system should be beneficial to the consolidation of socialist public ownership, development of the socialist economy, impelementation of the socialist relation of exchange and mutual cooperation, and realization of the planned economy. In short, the requirements of the socialist economic laws must also be reflected. In the past, it was overemphasized that socialist principles be strictly adhered to and that the price system conform with the requirements of the socialist economic laws; policy was regarded as the only basis, giving little consideration to the law of value and negating the law of supply and demand. Naturally, this was wrong. However, we should not now rely only on the requirements of the commodity economic laws for achieving a rational price system and take no heed of policy requirements. For example, subsidies were indiscriminately granted in formulating and adjusting prices and an irrational policy of purchasing at high prices and supplying at low prices was practiced, resulting in a heavy burden for the state; on the contrary, some people now hold that subsidies are bound to hamper the normal development of the commodity economy and policy requirements are certain to hinder the functioning of the economic laws.

As a matter of fact, in the development of the commodity economy, there also exists the problem of the superstructure serving the economic basis. Naturally, this service also comprises utilizing state subsidies to facilitate the development of the socialist economy. The problem is not whether we should grant subsidies, but that the subsidies granted be truly required by the development of the socialist economy and be within the financial resources of the state and that subsidies should never be used to protect backwardness. Similarly, policy and economic laws are not inherently contradictory. No doubt, policy belongs to the superstructure and is the product of subjective thinking. However, if policy can suit the requirements of the economic basis and correctly reflect the requirements of the economic laws, it will certainly not hamper the normal development of the commodity economy, nor will it hinder the functioning of the economic laws. On the contrary, a correct policy can serve the economic basis and pave the way and provide a good environment for the functioning of the economic laws; furthermore, under the socialist conditions, a correct policy can reduce the impact and evil effect of the blind and spontaneious functions of the economic laws, thus providing favorable conditions for consciously utilizing the economic laws.

From the above, it can be seen that a rational price system cannot be established without giving due consideration to the law of supply and demand and to policy requirements. If the price is arbitrarily made to conform with the value, thus making the price system equivalent to the ratio of value, the end result will be chaos and hindrance for the normal development of the national economy, making it difficult for the economic reform to proceed. This is because such practice will make it hard for the price lever to function, thereby leading to the following consequences:

1. The development of production will be unable to cope with the structure and the changes of the consumption needs. That is to say, it will be difficult for economic development to proceed harmoniously and on a proportionate basis. This is because the prices of products failing to meet demand will tend to be low, which will prevent the flow of the social funds, manpower, and material resources to the departments producing these products; on the other hand, which will hamper the withdrawing of the social funds, manpower, and material resources from the departments producing these products.

2. It will hamper the improvement of the varieties and patterns of products, and will particularly hamper the enhancement of quality. Very often, some products with superior quality and wide acceptance among customers are unable to meet demand, but their prices are comparatively low due to the above practice, which will discourage the producers from maintaining the fine varieties and quality of their products; on the other hand some products with poor quality and poor acceptance among customers exceed demand, but their prices are still comparatively high due to the above practice, which will discourage the producers from endeavoring to improve the varieties and quality of their products.

3. It will be harmful to the organization of commodity flow. For example, in some regions in which supply cannot meet demand, the above practice makes it impossible to raise the prices to some extent, which will hamper the in-flow of commodities from other regions; whereas in some regions in which supply exceeds demand, the above practice makes it impossible to lower the prices to some extent, which will hamper the out-flow of commodities to other regions. Another example is that when supply exceeds demand in some periods in which production rises but sales drop, the above practice makes it impossible to lower the prices to stimulate consumption; whereas when supply cannot meet demand in some periods in which production falls but sales rise, the above practice makes it impossible to raise prices to inhibit consumption. A further example: When a certain commodity is in short supply, the above practice makes it impossible to widen the price differential between purchase and sales for wholesale business so as to encourage purchase from both local and outside sources; whereas when supply exceeds demand, the above practice makes it impossible to widen the price differential between wholesale and retial business to encourage marketing and the flow of commodities from cities to the countryside.

4. It is not beneficial to stabilizing the people's livelihood and guiding the people in improving their consumption. This is because the above practice makes it impossible to maintain adequate prices by granting requisite subsidies to people's daily necessities when commodities are in short supply and when prices rise; whereas it is impossible to encourage and guide consumption by adquately lowering the prices of commodities that suit the people's needs when the supply exceeds the demand and commodities are overstocked.

5. It will be unable to encourage the adoption of new technology and new products. New products and new technologies are often high in cost and their sales are limited because they are still not widely accepted by customers or factory end users. If subsidies are not adequately granted and their selling prices are not adequately taken care of, it will be impossible for these products to gain good sales or to compensate their losses, and in this way it will not be possible to give encouragement to reduction and marketing.

6. It will be unable rationally to utilize resources and materials to ensure the normal speed of economic construction. If the price must conform with the value, it will be impossible to raise the prices of rare and precious materials and their products so as to prevent waste; or inversely, it will also be impossible to lower the prices of abundant materials and their products to encourage consumption or to replace rare and scarce materials.

7. It will be unable to ensure the important revenue of the state. A considerable portion of state revenue and taxes comes from the profits and taxes of high-priced commodities (including television sets, refrigerators, recorders, watches, electrical home appliances, as well as wines and cigarettes). If the price must conform with the value, these high-priced commodities (the extent of price higher than the value should of course depend on the level of purchasing power and the condition of demand and supply) must be sold at ordinary prices. How then can the requisite state revenue be ensured?

8. It will be unable to protect the interests of regions that are remote and have backward economies as well as the minority regions, and it will be impossible to assist these regions in developing economy and improving the people's livelihood with the aim of promoting the harmonious development of the economy of various regions and strengthening If the price must conform with the value, under the condition that labor productivity is low and cost is high in these regions, it will be hard to facilitate production of the purchasing price is not favorably fixed; at the same time, the products in these regions are not in abundant supply, and they have to take in a great amount of advanced technologies, materials, and industrial products, but their transportation route is long, inconvenient and costly, and if they cannot get preferential terms in their purchases and sales, it will be hard for them to endeavor to protect and improve consumption.

ESTABLISHMENT OF PRODUCTION BASES IN NORTHEAST CHINA

SK220554 Shenyang DONGBEI JINGJI BAO in Chinese No 35, 5 Apr 86 pp 1, 4

["Excerpts" of speech by Wang Luming, deputy director of the Northeast China Economic Zone Planning Office of the State Council, delivered at the forum on rural development of the Northeast China economic zone: "Cooperate To Develop Rural Commodity Production Series"--date not given]

[Excerpts] The provinces in Northeast China, as a complete economic zone, are closely related to one another in terms of either history or geographical positions. Such relations become all the more close, in particular, during the socialist modernization drive, and following the development of the commodity economy. It is an objective requirement of the development of the socialist commodity economy to carry out discussions between the east and the west, or between the north and the south areas of the economic zone, or to carry out exchanges among the provinces and the region to promote lateral economic cooperation. It will certainly facilitate a rapid development of our socialist construction.

This forum is the first one to study rural development since the establishment of the Northeast China Economic Zone Planning Office of the State Council. I will now give some opinions on the rural development of the Northeast China economic zone and, in particular, on how to cooperate to develop commodity production series.

Strengthen the Building of the Various Categories of Production Bases in the Rural Areas of the Zone, and Develop Rural Commodity Production Series

The Northeast China economic zone is one of the important industrial as well as agricultural bases of our country. During the "Sixth 5-Year" Plan period, the state will also prepare to establish several commodity production bases one after another in this zone, such as soybean and corn export bases, fine-quality rice bases, forestry and timber bases, animal husbandry bases, aquatic product bases, apple and berry bases, and American ginseng bases.

Based on the economic situation of Northeast China, we should give priority to the establishment of the following kinds of agricultural bases to develop commodity production series.

1. Establishment of marketable grain bases, and grain and soybean production series.

The Northeast China, in particular the Songliao, Songnen, and Sanjiang plains, and the central chernozem area, is one of the important marketable grain production bases of the country. Thanks to the household output-related contract responsibility system, the situation in grain production was very good during the "Sixth 5-Year" Plan period, and the results and contributions were significant. During the "Sixth 5-Year" Plan period, the average annual grain output was close to 100 billion jin, and the output of 1984 alone reached 103.1 billion jin. The population of that year was 102.38 million and, therefore, the per-capita amount of grain was 1,003 jin, 200 jin more than the national average. In 1985, the grain output of the zone declined by about 24 billion jin due to floods. It is not difficult to see from this that how to stabilize and develop the grain production of Northeast China is an important task for study. The state places fairly great hopes on the grain production of northeast China during the "Seventh 5-Year" Plan period, and has assigned us fairly heavy tasks. The 1986 target is 97.52 billion jin, of which 27.5 billion jin should be produced by Liaoning, 30 billion jin by Jilin, 33 billion jin by Heilongjiang, and 7.02 billion jin by the three leagues and one city in the eastern part of Nei Monggol. The 1990 grain production target for the entire Northeast China will be 110.6 billion jin, 7.5 billion jin more than in 1984, which marked a year of bumper harvest.

We should also attach great importance to land in order to guarantee a stable grain growth. Land, mainly farmland, is the basic means of production needed in the process of grain production. At present, there are two problems concerning land. The first is the continuous reduction of farmland. We can say that in Northeast China, farmland has been occupied to a serious extent. As far as I know, as much as some 1 million mu of farmland was occupied in a year in Heilongjiang when the situation was worse. Thanks to improved management, farmland occupied for capital construction use was reduced to 200,000 mu in 1985. In Liaoning Province, 560,000 mu of farmland was occupied for capital construction use in 1985. The second problem is the general reduction of the fertility of farmland. The reasons for the fertility reduction are aggravated by land erosion, and the low input to farmland and slackness in field management. We should pay close attention to these problems. There are still two basic ways of grain production. One is intensive farming to increase per-unit yields, and the other is to have sufficient areas for planting.

2. Establishment of forestry bases, and timber and other forest product production series. Abundant in forest resources, Northeast China now has 35.34 million hectares of forests, amounting to 28 percent of the total area. Forest reserves are also very considerable.

Since the founding of the PRC, Northeast China has scored great achievements in forestry, and made tremendous contributions to the economic construction of the state. However, consumption of resources outstripped their growth, and the present forest crisis has become increasingly serious.

It is necessary to greatly develop diverse undertakings and multipurpose utilization on the premise of gradually restoring the benign cycle of forest areas and maintaining an ecological balance in order to turn the advantage in resources into economic advantage. Forestry production should be commercialized and serialized, the relations among lumbering, tree planting, and marketing should be brought into balance, pre- and post-production service should be successful, and forest products should be greatly developed. In building forests, we should, on the one hand, successfully build forest bases in mountainous areas and, on the other, build shelterbelts and fuel forests in the vast plains. We should pay particular attention to the building of shelterbelts in the North, Northeast, and Northwest China. We should implement the policy of taking forest cultivation as the foundation. In forestry development, we should exert persistent efforts, support the forests which need long growing period with those needing short growing period, and emphasize the cultivation of young and middle-aged forests and fast-growing and high-yielding forests.

3. Establishment of animal husbandry bases, and various animal husbandry product production series. Northeast China is provided with favorable conditions for animal husbandry development. There are vast grasslands in the three leagues and one city of Eastern Nei Monggol, and the acreage of the grasslands of Liaoning, Jilin, and Heilongjiang Provinces is nearly 100 million mu. The world-famous Hulun Buir great grassland, the Songnen grassland, and the grassland in the Sanjiang plain are all located within our economic zone. We are really richly endowed with nature to have such good bases for animal husbandry development. In reality, however, our animal husbandry development is far from being ideal. Take the meat targets of Liaoning, Jilin, and Heilongjiang of 1984. The total meat output of Liaoning Province was 1.16 billion jin, with the per-capita amount of 31.7 jin; that of Jilin was 570 million jin, with the per-capita amount of 24.9 jin; and that of Heilongjiang was 700 million jin, with the per-capita amount of 21 jin. All the three provinces lagged behind the national average of 33.81 jin in terms of per-capita meat output. The planned targets of 1986 are higher than those of 1984 and 1985, with the target of Liaoning being 1.26 billion jin, that of Jilin being 700 million jin, and that of Heilongjiang being 850 million jin. However, the situation of shipping pork in from the areas inside the Shanhaiguan will remain. According to the state plan, 35,000 tons of pork will be shipped to these three provinces, with 5,000 tons to Liaoning, 5,000 tons to Jilin, and 25,000 tons to Heilongjiang. Egg and milk supply of these three provinces are slightly better than other areas of the country. In short, animal husbandry is a very weak link of Northeast China. According to statistics, the secondary productive forces of the three northeast provinces are, in general, low. Meat output from per 100-mu farmland is merely 1,034 jin, slightly higher than the Loess Plateau only in the country, amounting to one-eighth of that of high-yielding areas of the country, and amounting to one-tenth of that of advanced countries of the world. Therefore, we should see our difference as well as potential, make the best use of the favorable conditions of the Northeast China Economic Zone, greatly develop animal husbandry, and upgrade the position of animal husbandry in the rural economy.

While developing animal husbandry in farming areas, we should also develop it in pastoral areas. Pastoral areas should also develop diverse undertakings as mountainous areas do, and carry out multipurpose utilization. As farmland, grassland should also be managed more intensively, and be improved. The new grass production industry should become an important branch of industries. We should combine farming and animal husbandry, carry our serialized production of meat, milk, eggs, wool, and fur products, and coordinate production, supply, and marketing.

4. Establishment of aquatic product production bases, and commodity production series. The Northeast China economic zone has 2,492 km of coastline, accounting for more than 10 percent of the nation's total, 19.1 million mu of shallow waters, 2.45 million mu of beaches, and 930,000 mu of reef areas. It also has many rivers, lakes, and reservoirs in its inland area, which constitute a favorable condition for aquiculture. Over the past few years, through the contract system, the cooperation with other areas, and the policy of opening to the outside world and enlivening the domestic economy, Northeast China achieved great development in aquiculture. According to statistics of Liaoning, Jilin, and Heilongjiang, the 1985 output of aquatic products was 612,000 tons, of which 530,000 tons were produced by Liaoning, 60,000 tons by Heilongjiang, and 22,000 tons by Jilin. Judging from the resources, however, the potential is still very great. According to an investigation report on Liaoning's agricultural resources, the areas of shallow seas that have been already utilized amounted to only 9.7 percent of the total, the utilized beaches amounted to only 21.9 percent of the total, and the utilized rocks and reefs amounted to only 3 percent of the total. Inland water areas have yet to be fully used.

The state has assigned a task of producing 661,000 tons of aquatic products to Liaoning, Jilin, and Heilongjiang in 1986. Of the total, Liaoning should produce 570,000 tons, Jilin 25,000 tons, and Heilongjiang 66,000 tons. The task for 1990 is 660,000 tons [as published], of which 700,000 tons should be produced by Liaoning, 60,000 tons by Jilin and 100,000 tons by Heilongjiang.

In the production of aquatic products, we should make a success of both marine products, and fresh-water products, of both staple products, and rare products. Northeast China produces many kinds of aquatic products, such as sea cucumber, prawn, oncorphnchus keta, red trout, surgeon, and dabai [1129 4101] fish in Xingkai Lake. They are well-known at home and abroad. We should conscientiously organize their production.

5. Establishment of dried and fresh fruit bases, and commodity production series. Known as the "home of apples," Liaoning is one of the important fruit production bases of the north China. It has a long history of fruit production, rich resources, and many varieties. At present, it has nearly 5 million mu of orchards, and in 1985 alone, its fruit output was 16 million dan (its highest annual output of 20 million dan was reaped in 1983), of which 14 million dan was apples, accounting for 25 percent of

the total apple output of the country, and ranking second. About 80 million jin was exported a year, which represented about 60 to 70 percent of the total export volume of the country.

6. Do a good job in vegetable and nonstaple food production bases on city outskirts, and commodity production series. With fairly developed industries, Northeast China has 62 large and medium-sized cities with 35 million residents. The percentage of urban residents is higher than the national average, and the ratio of urban residents to rural residents is 4 to 6. This means that the vegetable demand of our urban population is greater than the national average. In addition, vegetable growing period is short in north China. Therefore, the task to ensure vegetable supplies to cities, industrial and mining areas, and forest areas is more arduous in Northeast China.

Greatly Develop Township Enterprises, Operate Rural Industries to Support Agricultural Production, and Expand the Rural Economy in a Coordinated Manner

While developing agriculture to maintain economic stability, we should exert great efforts to develop industries to achieve prosperity, and to develop commerce to enliven the economy. As an important component of the rural economy, township enterprises have been expanded fairly rapidly in Northeast China over the past few years. In 1985, the output value of the township enterprises of Liaoning Province was 13.2 billion yuan, showing an increase of 47.6 percent over that of 1984. The output value of the township enterprises has amounted to more than 50 percent of its total rural product. The output value of Heilongjiang increased from 2.87 billion yuan in 1984 to 4.17 billion yuan in 1985, a 45 percent increase. Generally speaking, the development of township enterprises in Northeast China has been rapid over the past few years, but still lags rather far behind its resources foundation, technological conditions, and geographical position. We should give full play to our own advantage, strengthen lateral cooperation, develop township enterprises more successfully, and make them more flourish. We should work out good plans, and open up more avenues.

The development of township enterprises should be based on agriculture, which in turn will be promoted by township enterprises. In the No 1 document issued this year, the central authorities put forward the need to coordinate the development of agricultural and rural industries, and to implement the policy of supporting agricultural production with rural industries. This will certainly promote agriculture. The state has decided that in the coming 5 years, 1 billion yuan from the taxes levied from township enterprises will be set aside every year to serve as special funds for supporting agriculture, and is working out plans for this. In short, we should properly handle the relationship between agriculture and rural industries, make them supplement each other, and develop them simultaneously.

Develop Later Economic Cooperation, and Promote the Rural Economic Reform

Lateral economic cooperation is a requirement of the development of the socialist commodity economy, and also a requirement of large-scale socialized production. It is one of the basic prerequisite for the existence and development of the commodity economy. There will be no commodity economy without it. Lateral economic cooperation also serves as a strike to the barriers between different departments and different regions. These barriers are obstacles to the development of the socialist commodity economy. In this sense, expansion of lateral economic cooperation helps eliminate the barriers.

What we should earnestly study now is, in the realm of the rural economy, particularly in the Northeast China economic zone, how we should expand lateral economic cooperation, in what fields we should seek cooperation, what the content of the cooperation should be, what forms or measures we should adopt, what principles we should abide by during cooperation, etc. All of these are new questions. We should study well the State Council's "Regulations on Some Questions Concerning Further Promoting Later Economic Cooperation," and expand the cooperation in line with the actual conditions of the development of the rural commodity economy.

Following the development of agriculture, the role of science and technology becomes more and more important. In order to develop agriculture rapidly, we should greatly strengthen agroscientific research, and application of technologies, increase intellectual investment, upgrade peasants' scientific and general knowledge levels, and train technical personnel. The agroscientific research institutions in Northeast China should fully perform their functions, and contribute their efforts to the modernization of agriculture.

In conclusion, I will point out that as a complete economic zone, Northeast China should conscientiously study the strategy for the rural development, and work out an overall rural development plan corresponding to the situation of the Northeast China economic zone. It should study strategic goals for development, strategic ideology, strategic distribution, and strategic measures. We should work out a rural development strategy for the entire Northeast China economic zone on the basis of the study of individual provinces and the region.

BRIEFS

NINGBO INTERNATIONAL AIRPORT CONSTRUCTION--Ningbo, May 20 (XINHUA)--Ningbo, a major port city in Zhejiang Province, is opening up international air routes, reconstructing scenic spots and expanding the number of hotel rooms to meet the needs of overseas tourists and seamen now coming in greater numbers. The coastal city's first international airport is under construction and is expected to be put into use next year to cater to overseas tourists, the number of which has grown at an annual rate of 37 percent since 1979. TIANJIN PLANNING TO EXPAND INDUSTRIAL BASE

OW251934 Beijing XINHUA in English 1542 GMT 25 Apr 86

[Text] Tianjin, 25 April (XINHUA) -- Tianjin, north China's biggest port and major industrial base, will build an industrial estates for metallurgical, chemical, woolen textile and petroleum factories in an area east of the city during the Seventh 5-Year Plan (1986-1990), according to Major Li Ruihuan.

China's new 5-year plan was adopted earlier this month at the national people's congress. Local governments are working out their own plans according to the targets and tasks set in the national plan.

At a meeting of the Tianjin municipal people's congress now in session, Li said the city will build a plant with an annual capacity of 500,000 tons of seamless steel tubes and a large copper factory, expand chemical fiber and three woolen textile mills and update three chemical works.

The output of the Dagang oilfield will be raised and the petroleum refinery improved.

As for the nearby economic and technical development zone, construction will be concentrated on a three sq km industrial district and a 1.2 sq km housing area in the next 5 years. The zone's industrial output is expected to reach 10 billion yuan by 1990, doubling the 1985 figure.

By the end of 1985, contracts had been signed with overseas businesses for 20 joint ventures and cooperative enterprises in the zone.

Meanwhile, he said, new berths will be built at Tianjin's new harbor to raise its capacity by 55 percent. Also, the airport will be updated and new air services added.

GANSU PLANNING, FINANCE CHIEFS REPORT TO PEOPLE'S CONGRESS

HK100315 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 9 May 86

[Excerpts] The fourth session of the sixth provincial people's congress held its second full gathering on 9 May. Li Ping, chairman of the provincial Planning Commission, delivered a report on the execution of the national economic and social development plan for 1985 and the draft of the 1986 plan. (Wang Guoxiang), deputy director of the provincial finance department, reported on the final accounts for 1985 and the draft budget for 1986.

Responsible comrades including Li Ziqi, Li Dengying, and Wang Bingxiang attended the gathering. Also present were Wang Shitai, member of the Central Advisory Commission; and Yang Zhilin and Li Keru, members of the national CPPCC.

(Wang Guoxiang) said: The province's total financial revenue in 1985 was 2,789,450,000 yuan. Total expenditure was 2,419,490,000 yuan. The province had a net surplus of 139.88 million yuan, an increase over the previous year's surplus.

Li Ping said in his report: The province must strive to fulfill nine major plan targets this year. This is the initial year of the Seventh 5-Year Plan. Doing a good job in arranging this year's plan is of great importance for invigorating Gansu's economy. He said: The major targets for this year are as follows:

1. The draft plan calls for an increase of 8 percent in industrial and agricultural output value this year, and for efforts to achieve a 10 percent increase.

2. On the basis of grasping grain production and ensuring steady growth in its output, readjust the rural production structure in a measured way.

3. Get a good grasp of production and construction in energy, communications, and raw materials and their processing industries. We should also develop the food, clothing, and consumer durables industries and strive to improve product quality. We should increase output of best-selling products.

4. Strictly control investment in fixed assets and seriously readjust the investment structure.

5. Further invigorate circulations, control the rise in the price index, and improve material supplies.

6. Increase exports and earn more foreign exchange. We should do a good job in managing and using foreign exchange.

7. Get a good grasp of supporting poor areas and speed up the pace of transforming their appearance.

8. Speed up the progress of science and technology and the work of exploiting brain-power, and vigorously develop various social undertakings.

9. Reform the planning structure and promote theestablishment of lateral economic ties.

Li Ping said: The province's current economic situation is very good, but there are also many difficulties and problems. It will be rather difficult to carry out the plans. We must persevere in reform, clear the way to forge ahead, do our work in a thoroughly sound way, and take positive and effective measures to fulfill and overfulfill the targets for this year.

(Wang Guoxiang) said in his report: We must work hard to increase revenue and economize expenditure and strive to fulfill the revenue and expenditure plans for 1986. The financial revenue task allocated by the state to our province this year is 1,771,310,000 yuan. After making a 14.92 million yuan allowance for reduced or waived agricultural tax on 70 million jin of grain, the province's planned revenue is 1,756,390,000 yuan. After allowing for various price and other subsidies totalling 98.88 million yuan, the province's budgeted revenue is 1,855,270,000 yuan, an increase of 7.23 percent over last year.

(Wang Guoxiang) said: The guiding idea on fiscal work in Gansu this year is to promote production, improve economic results, get a good grasp of revenue, control expenditures, and ensure the key points while taking care of the rest.

He said: Gansu's production continued to rise in the first quarter of this year, and revenue rose by 23 percent compared with the same period last year, while expenditures rose by 20 percent. This has laid a good foundation for accomplishing this year's budget.

ECONOMIC MANAGEMENT

VICE PREMIER TIAN JIYUN ON PRICE REFORM

Beijing ZHONGGUO JINGJI TIZHI GAIGE [CHINA'S ECONOMIC STRUCTURE REFORM] in Chinese No 3, 23 Mar 86 pp 4-6

[Text] Vice Premier Tian Jiyun said: Last year price reform took a major step forward. This year we must consolidate, digest, complement and perfect whatever measures have already been taken, to keep commodity prices basically stable.

Price reform is the key to success or failure in the reform of the entire economic structure. Smooth progress in reform of the encomic system depends to a very large deree on the price reform. Recently, a reporter of this publication interviewed Vice Premier Tian Jiyun on the circumstances of last year's price reform and on the policy and task of this year's price reform.

[Question] Will you, Vice Premier Tian, first of all be kind enough to state your basic views on last year's price reform.

[Answer] Last year's price reform can be roughly summarized in three sentences. First sentence: It was a year of great progress. Last year's price reform was, in retrospect, a very large step forward, and it was accomplished comparatively smoothly. Generally speaking, the price reform was on the right track; it went on in a normal way, and its results were good.

Second sentence: It was also a year of plentiful problems. Of course, there were many different reasons for such problems to arise. In a reform it is impossible to entirely avoid the emergence of all kinds of problems.Price control departments and other relevant departments have done much work to solve these problems. Some problems have already been solved, while others are in the process of being gradually resolved.

Third sentence: It was also a year of intensive struggle. To ensure smooth progress of the reform, and to gain the anticipated results, the party committees and people's governments at all levels have been intensively at work. Comrades of the price control departments have closely cooperated with comrades in other relevant departments, have worked cautiously and attentively, earnestly and assiduously. All quarters have made tremendous efforts and have achieved very great contributions.

[Question] What reforms were made last year with regard to prices?

[Answer] Last year, we took important steps forward in the price reform. First, we regulated and straightened out the procurement and sales prices for grain in the countryside. This was a problem that had been building up over many years; it was resolved last year. At the same time, the system of procurement of grain, cotton, edible oils and other important agricultural and sideline products was reformed and changed from a system of centralized and assigned procurements to a system of purchases by contract. This was of major significance in the promotion of the commodity economy in the rural areas. Second, we readjusted the procurement and sales policy for live hogs, and everywhere freed prices for pork, vegetables and other fresh and live nonstaple foods. It was in this most sensitive area, so closely linked with the livelihood of the masses and posing the greatest difficulties to the reform, that a very major step forward was accomplished. Many countries regard this area as one where it is most difficult to effect reforms; we have passed this stage comparatively smoothly. Third, we have adjusted railway freight rates for shorter distances. This item of reform has also had good results; it gave highways and waterways the chance to become distribution lines on par with the railway. Moreover, we instituted a "twin tier system" in the prices for the means of production and opened up prices for small commodities; there was further progress in all these areas. In short, last year's price reform was a great step forward in the direction of regulating and straightening out our pricing system. These measures had a positive effect on economic developments, and results will become even more evident as time goes on.

[Question] Why were price increases last year of such magnitude?

[Answer] Last year, we had indeed the problem of excessive increases in the commodity price indices. Nationwide it rose to as high as 9 percent, but the increases were, of course, unequal in different areas, but particularly large on the big cities. The following are roughly some of the reasons forthe magnitude of commodity price increases last year: First, the structural adjustment of prices. This was an adjustment, carried out on our own initiative, to regulate and straighten out our system of prices. Second, since the fourth quarter of 1984, the scale of capital constructions had been excessively large, the speed of industrial development was excessively high, there was a steep increase in consumption capital, too much currency was put into circulation, and demand for many goods exceeded supply.All these factors caused commodity prices to go up. Third, most prices for agricultural and sideline products were freed, and the prices for unplanned industrial means of production rose, spurring on price increases for a part of the consumer goods. Fourth, deficiencies in specific areas of work. Most conspicuous is the vegetable problem. After freeing prices for vegetables,there was no response in many large cities by a corresponding increase in work performance. Planned vegetable planting was not properly carried out, and distribution channels were not opened up. This resulted in large increases in the prices of staple vegetables. Fifth, several industrial and commercial enterprises and individually operated businesses and factories violated the state's policy on commodity prices, raised their prices indiscriminately and charged exorbitant prices. Although we took this problem firmly in hand, supervision and investigation are not yet fully effective.

[Question] Although commodity prices have risen,living standards have been rising too; is that not the actual situation?

[Answer] This is a fact; this is a very objective way of looking at the problem. Although the magnitude of commodity price increases in the course of our price reform was somewhat larger than in the past, the people's income rose at the same time because the price adjustments promoted economic development. In the overall view, the magnitude of increases in the people's income exceeds the magnitude of commodity price increases. Statistics show that during the period of the Sixth 5-Year Plan the index of commodity prices rose 18.7 percent, while the average income of employees rose 68 percent, and the net income of peasants rose 109 percent. Of course, in the specific cases of every household's and every individual's income, conditions differ and there is no general balance.

[Question] In the face of the extremely large increases in last year's commodity prices, what measures is the state taking to solve this problem?

[Answer] The CPC Central Committee and the State Council give their utmost attention to this problem. and a series of measures for the resolution of the problem have been or are in the process of being taken.

Last year, we have in macroeconomic respects strengthened control over the scope of capital construction and consumption capital. These are important measures to solve the destabilizing factors that have appeared in the national economy, and with respect to controlling the upward trend in commodity prices they are radical measures, much as "removing the firewood from beneath the cauldron." To solve the problem of excessively high prices for vegetables in large and medium sized cities, we are demanding that certain areas in the suburbs be preserved for the growing of vegetables, and that the state-run commercial enterprises must control a large sector of the sources of staple vegetables. They must procure them and market them and thereby readjust, level out and bring down the prices. If necessary, a ceiling price may be imposed on certain important kinds of vegetables. As to the floating prices for important unplanned industrial means of production, ceiling prices have been prescribed. We have at the same time strengthened the investigation, control and supervision of commodity prices. The implementation of all thses measures has already shown good results, and they are bound to bring more obvious results in future.

[Question] What are this year's policies and tasks in our work in connection with commodity prices?

[Answer] This year the reform of the economic system will mainly consist of "consolidating, digesting, complementing and perfecting" the measures that have already been taken in the reform. We have to preserve the favorable points, eliminate shortcomings, and solve conspicuous problems. We must at the same time make preparations for the important steps in the reform that we shall be taking next year and the year thereafter. This is the policy for this year's reform of the economic system, as it is also the policy for the price reform. This year's task for commodity price work is: First, resolutely preserve the fundamental stability of commodity prices, and second, make effective preparations for next year's price reform. Price reform must be carried out step by step in a planned way. A comparatively large step forward in the price reform was taken last year. With due consideration for the financial capacity of the state, the capability of enterprises to digest and the capability of the masses to endure, we shall try to keep commodity prices basically stable this year, and will not enlarge on further reform measures.Even in the case of irrational prices for certain commodities, we should also only effect small adjustments, sometimes upward and sometimes downward. These adjustments will also mainly be for the purpose of consolidating, digesting, complementing and perfecting whatever reform measures have already been carried out. Items that should not be increased in price will certainly not be increased in price. It shall certainly not happen that in areas, in which we have this year not carried out large reform measures, a lot of small disturbances should take place, as a result of which there will be no solution of any problem, but on the other hand still the creation of a bad image. This would only create difficulties for next year's reform. We must now in good time bring up this problem so that everybody will pay attention to it. Governments at all levels and relevant departments must regard this matter of keeping commodity prices basically stable as an important task and conscientiously accomplish it.

[Question] What measures will be taken to maintain commodity prices basically stable during this year?

[Answer] We have to realize that maintaining commodity prices basically stable during this year is an arduous task, which requires the application of a variety of measures.It is particularly necessary to concentrate on the key points.First, in concentrating on key measures, it is important to strengthen and perfect the macroeconomic control, to take resolute measures to control the scope of investments in capital construction and to control the indiscriminate growth of consumption capital. At the same time it is necessary to produce energetically articles that suit the markets and sell easily and will, therefore, satisfy the needs of the market. Second, we must concentrate on key localities, especially on the big and medium-sized cities, especially the three directly administered municipalities and the provincial capitals. Third, we must concentrate on key articles. I agree that the prices of vegetables and nonstaple foods be considered key articles in the stabilization of commodity prices. One vegetable, one meat and one egg: effectively concentrating on these three nonstaple foods and stabilizing their prices will satisfy the masses. Vegetables are an important item among important items.We must make every effort to keep the prices of vegetables basically stable. Where vegetable prices rose excessively last year, we must devise means to bring them down again. Freeing vegetable prices will stimulate the enthusiasm of the peasants to grow vegetables, and larger quantities of vegetables will be brought to the markets. With last year's experiences and lessons to go by, we shall improve our work performance, and we shall, therefore, also be able to realize this demand. It is not permissible that vegetable prices in a locality remain high for a long time;

it would reflect that quality of work in that locality. Eggs, when in season, should be briskly bought up and stored by the state-run enterprises. This would, on the one hand, protect the interests of the producers and would, on the other hand, also protect the interests of the consumers. The price control departments must cooperate with the commercial departments to make a success of this work and to even out seasonal price fluctuations.

The price control departments must strictly hold the line against unreasonable demands for price increases, resolutely put a stop to such increases and under no circumstances be overlenient. All price adjustments must be measured against the situation as a whole. If a price adjustment appears reasonable from a partial view, but would pose a problem from the overall view, the part must by all means be subordinated to the whole, and the small part must be subordinated to the larger part; the large principle must prevail over the small principle.

We must strengthen the work of supervising and checking commodity prices. Whenever prices for certain commodities are freed, we must not forget about them and show no further concern for them. All prices must be subjected to necessary guidance, coordination, supervision and management. This is a type of guidance measure, but also a measure of complementing and perfecting. We must resolutely put a stop to methods of indiscriminate price increases and must severely punish violators of the state's commodity price policy. We must exercise the necessary guidance with regard to prices in urban markets and strengthen control over individual traders. The state represents the whole people, not only a certain section; we must protect the interests of the whole people and must live up to our responsibility toward the producers, businessmen and consumers. Only when the whole people can live and work in peace and contentment will long-term stability and unity be assured.

[Question] Would you please prognosticate the future prospects of China's price reform.

[Answer] Since the 3d Plenum of the 11th CPC Central Committee, we have been engaged in a systematic adjustment and reform of prices. Viewed comprehensively, there are two things that must be made quite clear: First, it is imperative to reform China's current price system, as it would otherwise be impossible to regulate and straighten out the economic relations in all sectors, it would become impossible to achieve the long-term healthy development of the entire national economy, and the many contradictions in economic life would not only become impossible to overcome, but would grow even much more acute. In the long-term view, this would be detrimental to the economic development and to the improvement of the people's livelihood. Second, although there still remain different problems in the actual work of the reforms that we have carried out in all these respects during the last few years, we may say in general that successes have basically been achieved. The problems that emerge in the price reform can only be resolves by further perfection of the reform; under no circumstances must we reverse ourselves. These two points are our fundamental realizations with regard to commodity prices and price reform. Only by resolutely upholding these convictions can we further affirm our confidence in the price reform. This is highly important. Even if there are still great difficulties ahead in the price reform, we have already made an excellent start. In the course of actual practice, we have all gained a greater identity of views on the price reform and have gained the support of the masses. At the same time, by strengthening and perfecting the macroeconomic control, we are gradually eliminating the destabilizing factors which had emerged during the first stage of economic activities. All this provides us with the favorable conditions for the further pursuit of the price reform. I believe that if we will only unceasingly sum up experiences and lessons, painstakingly organize and diligently exert ourselves, it will indeed be possible to accomplish the objective of this year, namely to keep commodity prices basically stable. We will then also provide the price reform of the future with a better preparation than the preparation for the reform in previous years. The reform will then be better planned and achieve greater successes. We must have full confidence in these prospects.

JINGJI GUANLI DISCUSSES REFORM OF COMPANIES

HK290520 Beijing JINGJI GUANLI in Chinese No 4, 5 Apr 86 pp 4-7

[Article by Liu Jipeng [0491 4764 7720] and Liu Yan [0491 4282]: "A Preliminary Discussion on Several Questions Encountered in the Course of Company Reforms"--edited by Xu Xiaojiu [1776 1420 3773]]

[Text] Increasing the vitality of enterprises is a key link in the reform of the urban economic structure. At present the reform of the industrial management organizational system which revolves around this link is mainly centered on the question of administrative companies. It should be pointed out that administrative companies have played a certain role at the administrative organ level in governmental management of enterprises. However, as a form of economic organization, they are undesirable. A company is a form of economic organization in a commodity economy where there is a high degree of socialized large-scale production. If we link it and "administrative" together, we get "administrative company" which is theoretically illogical and which produces obstacles to economic development in practice. The lack of separation between government and enterprise functions in administrative companies, their severing of the economic relationships between enterprises, and their overcontrol of the enterprises under them has become one of the major obstacles to enlivening the enterprises. Thus, it is necessary to carry out thorough reforms in this respect. However, over the last year, the work of reforming administrative companies has met several difficulties which have restricted the deepening of reforms. This article will attempt to explore some of these problems with the aim of seeking out the advantages of carrying out the reforms.

1. The Question of "Two Levels of Legal Entity" in the Company Reforms

At present, as our nation does not yet have appropriate company laws, there has been a lack of research on the concept, characteristics, legal status, and other such questions in regard to companies under the conditions of a planned commodity economy. Thus, understanding is not uniform. During the company reforms, the general method was that administrative companies were turned into enterprises. However, the proposal did not clearly set down whether it was the management organ of the administrative company which was to be turned into an enterprise or whether the management organ was to turn all its subordinate companies into a new economic entity. Seen from the reform plans of several companies, only the company itself could handle licenses, and it became the legal entity of the enterprises. In fact, as the companies themselves do not have the conditions to engage in production and do not have the power to control the state planned supply of raw and semi-finished materials, many of them provide services to their subordinate factories in the circulation area both before and after production. In this way, old administrative industrial companies have changed into industrial product trading companies similar to enterprises. However, because the reform measures are not coordinated, many of the old functions such as the handing down of operational plans to subordinate factories, the appointment of factory directors, the regulation of the relations between the party and the masses, the arrangement of technical transformation projects, the examination and approval of income distribution plans, and so on must all be taken on by this new company. This gives rise to a very controversial question in the company reforms--the question of "two levels of legal entity." The basic essence of the "two levels of legal entity" is that in one company legal entities exist at two levels. The company itself constitutes the high-level company legal entity, which leads the various factory legal entities at a low level. For example, during the reforms operational service companies, joint companies, semi-intensive and loose production operations, joint operation companies, and so on have appeared. In general, they all retain the form of "two levels of legal entity."

We believe that the idea of "two levels of legal entity" is erroneous.

First, it is untenable on the theoretical level. Legal entities are like citizens in that they have independent characters in terms of the law and are fixed social organizations which are the subjects in enjoying civil rights and shouldering civil obligations. Legal entities have the right to independently deploy assets and can independently form organizations and arrange the sites of activities. They also have the capacity to independently bring suits and respond to suits. An enterprise's legal entity should maintain economic and legal independence. The legal entity in a collectively-owned enterprise bears civil responsibility for the assets of that enterprise while the legal entity in an enterprise owned by the whole people bears civil responsibility for the assets operated by that enterprise. Legal entities are equal. There is no relationship of upper or lower, or any differentiation between large or small, high or low.

In our nation, the significance of establishing a legal entity system lies in that it will enable the enterprises to really become socialist commodity producers and operators which are masters of their own operations, solely responsible for their own profits and losses, and able to develop and transform themselves, so that they can independently take on economic responsibility. When their operations are not good, resulting in losses or even bankruptcy, the responsibility cannot be taken on by a higher level responsible department or other legal entity. However, the idea of "two levels of legal entity" provides differentiation, in terms of enterprises' legal entities, between large and small, high and low.

Thus, independent assets of the enterprises' legal entities cannot be established. When the "small" legal entity incurs losses or goes bankrupt, it seems as if the "large" legal entity should take on the economic responsibility. This is clearly contrary to the aims of setting up the legal entity system in our nation.

What is worth noting is that some comrades who persist in advocating the "two levels of legal entity," in order to prove the rationality of their stand, cite the foreign examples of the relationships between parent companies and minor companies and between general companies and branch companies. This is an erroneous understanding. In foreign countries, in the relationship between a parent company and a minor company, the parent company exercises effective control over the important business activities and personnel arrangements of the minor company by controlling the shares of the minor company (for example by controlling 51 percent or above). However, the law stipulates that the minor company is not a component part of the parent company, much less a branch organ. Rather, it is an independent enterprise. Its independence is manifested in: The minor company has its own company name and regulations; it has independent assets, sufficient funds, and a balance sheet; it can independently call shareholders meetings and directors meetings and can participate in all sorts of business activities under its own name. It can be seen that between the parent company and the minor company there is no relationship of "two levels of legal entity." The reason the present company can control the minor company's business activities is that it controls the minor company's shares. In our nation, a funds market has not yet been formed and stock ownership is still being explored. There is no controlling share relationship between companies and their subordinate factories, and some only have the administrative leadership relationship between the company and factory which was formed under the old system.

Likewise, between a general company and a branch company there are not "two levels of legal entity." The branch company is a branch organ of the general company and does not have any independence or any individual character legally or economically. This is concretely manifested in the fact that the branch company has no independent name, regulations, or board of directors, that all its shares are held by the general company, that it has no independent balance sheet, and that its business operations are all decided on by the general company. The branch company engages in business only under the name of the general company and only in accordance with the general company's mandate, and the general company will use its assets to meet the branch company's liabilities. Thus, the branch company is not legally independent, and in terms of property, the branch company and the general company are mixed together.

Second, in practice this does not benefit the deepening of the reforms. If we allow differences between large and small legal entities, not only will the "large" legal entity bear responsibility for the "small" legal entity, but it will also have the power to exercise direct administrative interference in the operational activities of the "small" legal entity, and will be able to take on various of its administrative functions. The situation of there being no separation between administration and enterprise functions will continue to exist, but it will change from the "administration replacing the enterprise" to "the enterprise replacing administration." Also, after the company management organs change into new economic entities, it will produce apprehensiveness among the subordinate factories and they will worry that the company will only concern itself with its own interests and that in the question of material distribution it will differentiate between those near and those far. This phenomena has already appeared in some reformed companies.

If we say that reforming administrative companies is for the purpose of liberating enterprises from the administrative bonds produced by there being no separation between administrative and enterprise functions, then the proposal and methods of having "two levels of legal entity" will not basically resolve this problem. Rather, it will confuse the legal relationship between the legal entity, the company, and the factories. Thus, if the company reforms are to be deepened, it is necessary to abandon the concept of "two levels of legal entity."

2. Industrial Companies and Legal Status

After negating "two levels of legal entity," we need to further study the question of companies and their legal status. That is, who actually is the holder of the rights in regard to our nation's industrial companies? Who will assume the enterprises' legal status? During the reforms, some people have proposed changing the jurisdictional relationship of upper and lower into a partner relationship. This requires an answer as to whether the legal entity will actually be the administrative management organ which administers subordinate enterprises, and the company itself after it has been turned into an enterprise, or whether it will be a production operations composite formed from the company itself after it had been turned into an enterprise and its subordinate factories. This is a question which has caused constant debate in the Soviet Union and East European states for many years.

We believe that giving legal entity status to the administrative management organ is unjustifiable. Is it possible then to give legal entity status to the company itself after it has been turned into an enterprise? This is a fairly complex question. At present, a major indicator that our nation's enterprises have a legal entity position is that in the register of the state Administration of In-ustry and Commerce they have received a business license. In this, the registration of funds is an important facet of the registration procedure. This reflects the economic strength of an enterprise and the economic responsibility it should bear if it goes bankrupt. An examination of 44 industrial and commercial records in Chongqing and Beijing showed that the registered funds of companies which had been turned into enterprises were of three types: 1) Those which only included the property of the company itself--93 percent; 2) those which not only included the property of the company itself, but also included the fixed assets and total floating funds of their subordinate factories--5 percent; 3) those where the company itself has no property and there was only the total assets of subordinate factories--2 percent. From the first type, it seems that the legal person status of the company is naturally taken by the company itself after it is turned into an enterprise, and the company and its subordinate factories have a relationship of economic partners. This is legally feasible and seems to be economically rational. However, in such a case, what differences are there economically, legally, and in the relationship with the company itself between the company's external enterprises and its internal factories? Will the company only have administrative functions for its subordinate factories? We believe that at this stage, the internal nature of the companies has undergone changes and they are no longer companies in the original sense. Also, company entities which have been turned into enterprises do not, in the majority of cases, have productive capacity. They are only trading companies engaged in the circulation sphere. This should not be the direction of our nation's industrial enterprise reforms. In addition, the aim of reforming the administrative companies is not only, as some comrades believe, to have the people in the company support themselves. A more important aim is ti have our nation's industrial trade managem-nt move towards greater rationality. Some comrades advocate giving legal entity status to a production operation formed by the company itself after it has been turned into an enterprise and its subordinate factories. We endorse this understanding. However, it must be pointed out that the legal entity status of the subordinate factories must be abolished, and they must become production operation units within the company. If not, then it will be like the second and third types mentioned above as found during the examination. The company itself and all its subordinate factories will all register as independent legal entities, which will inevitably result in duplicate registration of assets, meaning that the amount of enterprises' assets registered will far exceed the actual amount existing.

In brief, our nation's industrial enterprises can be summed up as: Enterprise legal entities which engage in industrial production operations, which have operational autonomy in the handling of assets, and which are solely responsible for their own profits and losses. The companies should be complete, with unified accounting, unified tax payment, and unified credit. The enterprises' subordinate production operations units will not have independent legal entity status. In order to accord with a planned commodity economy system, internally the company should adopt an organizational structure with a high degree of separation of power and have small accounting units responsible for their own profits and losses, so as to fully motivate the enthusiasm of all of the production operations units.

3. Enterprise Alliances and Their Legal Status

Enterprise alliances are industrial organizational forms which have developed in recent years and which have great prospects. Their formation is different from the method under the old system whereby enterprises were "bound" together. They are economic alliance organizations formed under the conditions of continual development of socialized large-scale production and the commodity economy, through breaking through the divisions between regions, departments, and ownership systems, on the basis of enterprises' voluntary participation, mutual interests, equality, and consultation, and in accordance with the principle of "three no-change" (enterprises economic nature, the administrative jurisdiction relationship, and the channels for handing up taxes on profits), in order to strive for better enterprise and social benefits.

There are many and varied forms of alliance. There can be specialized coordination in production, operational supply and marketing alliances, or linking in terms of technology and information. There might be an enterprise alliance between enterprises which produce the same sort of product but which are situated in different areas, or there may be an alliance between enterprises which produce different types of products but which in their production technology have a close relationship. It may also be possible for those factories which have very competitive products on international or domestic markets to act as the "center" and to form alliances with various "satellite" factories in order to spur them on. The binding link between enterprises in an alliance can be a fairly stable long-term contract, agreement, or set of regulations, or it can be a management committee formed from representatives of the members of the alliance. It can also be a central factory. The various forms of horizontal economic combination put forward over the last few years, such as economic groups, economic blocs, and economic series are all forms of economic alliance.

Within the alliance, there does not exist "two levels of legal entity" because the combination itself is not an enterprise legal entity. If a combination needs to set up a management organ, it will only be a management organization to carry out coordination and provide service in the economic activities of the subordinate enterprises. It will have no independent property and will not be able to engage in operational activities, while the coordination and service work it does will have a democratic authoritative nature. If the enterprise members of an alliance are willing to have unified supply and marketing, then an industrial supply and marketing company can be set up. This company will be a legal entity and will not include or be included in the member organizations of the alliance. Between them there will be a relationship of economic partners. This type of relationship will be maintained by fairly long-term stable and preferential economic contracts, agreements, or sets of regulations, and it will not be a one-shot deal. Alliance contracts, agreements, and sets of regulations should be notarized so as to provide legal safeguards.

The Relationship Between Companies and Enterprise Alliances

Both companies and enterprise alliances are products of the commodity economy and socialized large-scale production. Correctly understanding and differentiating the nature and characteristics of the two has great importance in the company reforms.

An enterprise alliance is a primary form of alliance. None of the enterprises participating in the alliance loses its legal entity status. As soon as the alliance develops in depth, a merger of property and funds begins to occur between the allied enterprises. Finally, when this develops into a large economic entity, there occurs enterprise mergers, which result in the high-level form of alliance--the company. There are two types of this sort of merger: The first is assimilated merger. That is, when two or more enterprises merge, the legal entity status of a "central factory" is continued, while the legal entity status of the "satellite factories" is abolished. They become production operation units under the "central factory." The other type is merger through new establishment. That is, when two or more enterprises merge, the legal entity status of all the original enterprises is abolished and they newly establish a company with legal entity status. This newly-established company is an economic and legal entity comprising the entirety of the old enterprises. The contents and depth of this type of alliance causes the enterprises to undergo a "qualitative change." That is, it produces a trust company. Within an alliance, the entry or departure of an enterprise is, with the precondition of not violating agreements, completely voluntary. However, in a company, because the entire property of the company has been melded into a whole, the individual operational units and individuals can only transfer share rights in various senses. They cannot withdraw. None of the production operation units within the company has legal entity status.

At present the conditions are ripe for our nation to develop enterprise alliances. We should put great efforts into promoting the transformation of administrative companies into enterprise alliances. Recently in the company reforms, some enterprise alliances have been formed. However, they hang up a company shingle, resulting in enterprise alliances and companies becoming confused. This situation does not benefit the reforms and must be corrected. Of course, the experiences of industrially advanced nations have proven that a company is the most advanced economic organizational form and the most beneficial to improving enterprise and social benefits. The turning of enterprises into companies is a trend as the commodity economy and socialized large-scale production develop. We should recognize this trend and create conditions for the speedy development of companies in our nation.

UNIFYING OWNERSHIP RIGHT, USE OF FOREIGN EXCHANGE VIEWED

HK260904 Beijing JINGJI QUANLI in Chinese No. 4, 5 Apr 86 p 11

[Article by Zhang Shouyong [1728 0649 0516]: "The Right of Ownership and That of Use of Retained Foreign Exchange Should Be Unified" -- edited by Lin Daojun [2561 6670 0689]]

[Text] Beginning from 1 January 1985, the state has allowed adjustment of the ratio of retention of foreign exchange in foreign trade. In accordance with the principle of the linking of the creation of foreign exchange and the use of foreign exchange, and of whoever exports earns the foreign exchange and whoever creates the exchange uses the exchange, the various regions have stepped up organizing this adjustment, greatly aroused the enthusiasm of the various foreign trade and production enterprises to advance foreign trade, and promoted the technological transformation of the foreign trade and production enterprises. At the same time, this has played an active role in arranging and ensuring the sources of goods for export and developing and consolidating the production bases of the goods sources.

At present, the prices on the international markets of many of our export commodities have fallen while the state purchase prices in the country have continuously risen. The production cost of exports has also become increasingly higher. It has been very difficult to organize the supply sources of the export commodities. In particular, it is difficult to make state purchases of agricultural sideline products for export purposes. This holds for special produce and processed products. Hence, it is necessary to offer great help to the departments which supply the goods for export and help them to solve certain actual difficulties in their work of supplying export commodities. This should apply to their use of foreign exchange as well. At present, certain goods supply departments have created much foreign exchange, but have used very little of it. In order to adjust the economic interests of the units creating foreign exchange and units using foreign exchange and to arouse the enthusiasm of the foreign exchange creating units, in regard to the retained foreign exchange, it is suggested that the method of compensatory regulation and use of foreign exchange be adopted; that is, units not creating any foreign exchange, when using retained foreign exchange, or using in excess of the enterprise's retained foreign exchange, in addition to paying the state's prescribed foreign exchange rate, should pay a stated management fee or procedural fee so as to compensate the units creating foreign exchange for their losses. The exchange rate may be raised by 20 to 25 percent. Currently in the acutal work of organizing the sources of export commodities, whether or not the enterprise can obtain retained foreign exchange and how much retained foreign exchange, has in effect become an important condition in the negotiations on the purchasing prices between the enterprise doing the foreign trading and the enterprise supplying the export commodities. Whether or not there is any retained foreign exchange is closely related to the conditions of the supply of the commodities and, to a certain degree, plays a key role in this regard. Insofar as the enterprise is concerned, the current problem is that the right of ownership and the right of use of retained foreign exchange are separated from each other and that the regulation of the amount of exchange and the examination and settlement work of the plan of use of foreign exchange are under the control of different government organs. Hence, certain goods-supplying enterprises have entertained doubts as to whether or not they can obtain any retained foreign exchange and the right of use of it. In certain cases, they would rather give up the right of ownership of retained foreign exchange in exchange for certain "real benefits" in regard to the purchase prices. On the aprt of the foreign trade enterprises, they are also willing to take over the portion of retained foreign exchange normally belonging to the production enterprises for the sake of facilitating the arrangements for and making definite commitments on other sources of export commodities and supporting the production of export commodities. Nevertheless, what the commodities-supplying enterprises have ceded is the right of ownership of the retained foreign exchange and not the right of use of it. Thus, the existing method of foreign exchange control which separates the right of ownership from the right of use cannot allow the retained foreign exchange to fully play its role. In my opinion, the right of ownership and the right of use of retained foreign exchange should be unified. That is to say, the 12.5 percent belonging to the local governments should be subjected to the unified operation, examination, and approval of the local departments in charge, whereas the 12.5 percent belonging to the enterprises in the export trade should be subjected to the unified settlement of the enterprises engaged in foreign trading and be directly given to the enterprises supplying the commodities for the latter's autonomous use. As for the importation of the needed raw materials, technologies, equipment, and so forth entrusted to the foreign trade departments according to the requirements for the production and development of export commodities, the required foreign exchange may also be turned over to the foreign trade departments for unified arrangements in accordance with the principle of compensatory regulation. In short, it is essential that the autonmous power of use of retained foreign exchange be enlarged and the method of use of retained foreign exchange be turhther improved. State departments in charge should exercise their control by means of policies, statutes, taxation, issuance of permits, and so forth, but avoid over control or control to a strangling degree. Only by so doing can we ensure that this portion of the retained foreign exchange is truly to ensure supply sources for export commodities to develop export products, and to truly bring about implementation of the principle of combining import and export and using import to foster export.

JINGJI GUANLI ON ECONOMIC RESULTS ANALYSIS

HK290851 Beijing JINGJI GUANLI in Chinese No 4, 5 Apr 86 pp 33-36

[Article by Zhou Chuandian (0719 0278 0368), edited by Liu Qichang (0491 0366 2490): "On 'Economic Results Analysis'"]

[Text] 1. The Origin and Development of Economic Results Analysis

Economic results analysis is a continuation and development in the new period of "economic activities analysis" put forward by the Ministry of Metallurgical Industry. Looking at history, we see that the Anshan Iron and Steel Works was the first to develop economic activities analysis in the 1950's; this spurred some other metallurgical enterprises to obtain initial results. At the beginning of the 1960's, the Ministry of Metallurgical Industry decided to propagate the experiences of the Anshan Iron and Steel Works and other units and made "economic activities analysis" an extremely important method in leading economic work. This was developed in all metallurgical enterprises. In July 1963, leading comrades of the Ministry of Metallurgical Industry reported at a Ministry of Metallurgical Industry economic work conference that the economic activities analysis they had put forward was an important leadership method and an important work method, and that if we were to raise it to the high plane of Marxist epistemology and methodology, leaders at all levels from the ministry to the enterprise would have to study how to carry out economic activities analysis. They would have to use this as a weapon to promote the improvement of the economic results of the metallurgical industry. After Deputy Premier Bo Yibo read this conference report, he immediately wrote instructions affirming this experience. Later, the metallurgical system developed economic activities analysis more widely and more deeply. Metallurgical enterprises throughout the nation, from corporations to workshops, teams, and groups all engaged in analysis, promoting the development of the iron and steel industry at that time. In 1965 and 1966, the technological and economic targets advanced by leaps and bounds, creating the best level in history, and the economic results also saw great improvement. During the 10 years of disorder, the metallurgical industry suffered serious damage. The advocates and implementers of the "leftist" line took economic activities analysis as the "revisionist line in enterprise management" and criticized it fiercely. In the last few years, under the guidance of the correct line of the 3d Plenary Session of the 11th CPC Central Committee, we have swept away the "leftist" ideological influence and accorded with the demand to improve economic results. The fine tradition of economic activities analysis has also been gradually revived and seen new development. Because of the new path proposed by the party Central Committee and the State Council whereby economic work should have as its core the improvement of economic results and also has economic activities analysis as a sharp weapon of departments and enterprises for carrying out self-dissection, tapping potential, and improving economic results, everybody refers to it as "economic results analysis." Since the early 1980's, the iron and steel system has convened an economic results analysis meeting for medium-size iron and steel enterprises and a special steel-making enterprise economic results analysis meeting in 1983 and 1984, respectively. From the end of October to the beginning of November 1985, the Ministry of Metallurgical Industry arranged an economic results analysis meeting for large-scale iron and steel enterprises. Economic results analysis has continually developed widely and deeply, and many new trails have been blazed.

2. New Characteristics of Economic Results Analysis

1. Firmly centering on the core of improving economic results. In the past, when engaging in economic activities analysis, the taking of class struggle as the link was stressed. At all times, in all cases, and in all places, it was necessary to stress the 2-line struggle, and it was difficult to analyze economic activities purely on the basis of economic laws. Thus, its role could not be fully brought into play. Since the 3d Plenary Session of the 11th CPC Central Committee, the whole nation has taken economic construction as the center, and it has been required that all economic work switch to the track of improving economic results. Following the bringing of order out of chaos on the ideological front, economic activities analysis has now gradually accorded with this demand to improve economic results. Thus, it is not only a nominal change. Rather, new contents have been added, both internally and qualitatively, and new demands have been put forward.

2. Tightly combining with economic reform. The aim of economic results analysis is, through carrying out dissection and analysis of various types of economic activities, to bring into play positive factors, overcome backward factors, tap potential in various respects, and improve economic results. This analysis will inevitably touch on ossified economic management models that restrict the development of productive forces. This requires the changing of these models and the putting forward of reform proposals. At the economic results analysis meeting convened by the Ministry of Metallurgical Industry in 1985, the Shoudu Iron and Steel Works provided a speech entitled "The High Speed at Which Reform Spurs Economic Results." It was both a very good economic results analysis and a splendid essay on reform. In this sense, once economic results analysis is linked with reform, it can produce new vitality. On the one hand, it serves reform; on the other, it is a powerful weapon for promoting reform. Seen in terms of economic reform itself, only by using the method of economic results analysis will we be better able to reach the reform goals. In the economic activities analysis in which we engaged in the past, we did not dare touch on the question of the economic structure. Now

that the central authorities are engaging in economic reform, when we are analysing the factors obstructing the improvement of economic results and the development of the economy, we dare to touch on the question of the economic structure and require the putting forward of reform proposals.

3. Using modern management methods. Economic results analysis continues Marxist investigative research methods, stresses first-hand materials, and speaks only on the basis of data. At the same time, adopting modern management methods and electronic computers will ensure that economic results analysis is both qualitative analysis and quantitative analysis, and get close to objective reality. When carryingout analysis, some enterprises use systems engineering theory, the ideas of input and output, and mathematical statistics methods so that the analysis is more able to grasp the key points and be more persuasive. The comrades of the research institute under the Ministry of Metallurgical Industry have also used the "multi-target forward edge [qian yuan 0467 4878] analysis method" and the "multi-target comprehensive evaluation method" to carry out analysis of the production technology levels and comprehensive economic results of eight large-scale iron and steel joint enterprises. After processing large amounts of data, they established a mathematical model and used computers to carry out the calculations. The initial results provided by the two methods were basically identical. Although some target and data factors could not be completely compared, a major trend could be seen, and this can be used as reference in crosswise comparison between the various large iron and steel enterprises. It is also of benefit to enterprises in understanding their own and others' performance, so that they can develop competition through emulating, learning from, catching up with, and helping, and in turn surpassing, others.

In general, economic results analysis is the product of taking the new road of improving economic results in the new period. It is a product of adhering to the economic reforms and of management modernization. Understanding things from the high plane of Marxist epistemology and methodology and carrying out economic results analysis is the process by which to uncover, analyze, and resolve contradictions; the process by which to understand and transform the world; and the process by which to move from the material to the spiritual and the spiritual to the material. The development of objective things is a process of the movement of contradictions. Economic work is like other things and its development is full of contradictions. If we are to correctly analyze the movement of economic activities and promote economic development, we must stress the uncovering, analysis, and resolution of contradictions. Only through economic results analysis will we be able to grasp the key problems in a timely way, seek to resolve them, and continually raise economic work to a new level. That is to say, the formula "practice; analysis; decision-making; further practice" is the pattern on which a fine cycle in economic work can be realized. Thus, economic results analysis is an important leadership and work method which every enterprise leader should master in conscientiously raising his level of leadership work. It is also an important leadership and work method for economic leadership departments in overcoming bureaucratism, shifting from mainly using administrative methods to mainly using economic methods, and for making economic work increasingly specialized.

Thus, the Ministry of Metallurgical Industry has already made a decision to develop economic results analysis, and required that leaders at all levels further raise their understanding of the great importance of economic results analysis, of moving from unconsciousness to consciousness, and persisting within their own units in developing economic results analysis activities and in using this as a basic leadership method, a basic leadership system, and an important operational management system. Corporations, factories and mines, workshops, sections, and teams must all use this analysis in their development strategies, decisionmaking, and in concrete economic activities. It is possible to carry it out from top to bottom within the whole corporation at fixed periods or carry it out on a smaller scale at fixed times; the analysis can be comprehensive or specialized; it can be an individual or a comparative analysis; it can be vertical or horizontal analysis; and it can be quantitative, product type, qualitative, consumption, or cost analysis, or can be analysis in terms of capital construction, renewal and transformation, or imported projects. In general, we must center on the improvement of economic results, widely and deeply develop economic results analysis, systematize and regularize it, and have it move from shallowness to depth and from a low level to a high level. In this way, we can make economic results analysis a sharp weapon in the hands of the masses of staff and workers and can continually raise the level of enterprises' operations management and continually improve the economic results of enterprises and society.

3. How To Do Well in Economic Results Analysis

In putting together everybody's experiences in carrying out economic results analysis and doing well in economic results analysis, we must grasp the following points:

1. The leadership must pay attention to it and personally take a hand in the work. It was no accident that the Shoudu Iron and Steel Works was able to do well in economic results analysis. In July 1985, after the Ministry of Metallurgical Industry convened a preparatory meeting for the large-scale iron and steel joint enterprises' economic results analysis meeting, the enterprise leaders took command, organized a specialized group of eight or nine persons, collected large amounts of materials and data, repeatedly carried out analysis and research, listened to ideas on all sides, changed this and that, and then finally put forward a high-level report on economic results analysis. However, the leading comrades of some enterprises did not take economic results analysis as a method or measure in their own leadership of the enterprise. They did not take a hand in the work and did not provide correct guidance. They only handed it over to the comrades concerned with concrete work for them to handle. Things could not be done well in this way. This is because economic results analysis touches on broad area and has wide influence and, if the work is to be done well, it requires that the leaders personally take a hand in it and arrange for various strengths on all sides to be used

together. After economic results analysis is carried out well, goals can be put forward and measures planned. In this we must also rely on organized implementation by the leaders if we are to achieve the desired effects. Thus, leaders placing stress on and personally taking a hand is the most basic experience in doing well in economic results analysis.

2. There must be ideological leaders and correct attitudes. Economic results analysis is very meticulous and very specific investigative research and scientific analysis work. It is also work with very strong ideological and political implications. It is necessary to have ideological leaders and to link this work closely with ideological and [political] work. It is often in those units in which economic results analysis has become a mere word that ideological leadership is not stressed or else there are the ideas of being unconvinced, of being afraid to uncover contradictions, or of the "external cause theory." These sometimes seriously obstruct the further development of economic results analysis. If we do not overcome these mistaken ideas, we will not truly be able to carry out economic results analysis well. In this respect, the leading comrades in the various enterprises must have the good workstyle of listening to ideas from all sides, must have a modest attitude in studying advanced enterprises, and must have the courage to carry out self-criticism and criticism. Contradictions between things objectively exist, and only if we uncover and resolve these contradictions can our work progress. People should have self-knowledge and enterprises should also have self-knowledge. If an enterprise only sees its own strong points and does not recognize its problems or does not let other people or the masses point out its problems, the enterprises will not be able to be invigorated or be able to progress. In these 2 years, as we have organized the activities of economic results analysis, we have come across some leading comrades of enterprises who are afraid to uncover contradictions and sometimes, after the analysis materials have been produced, the leading comrades of enterprises have come out and said that they hoped that these would not be taken or made public. The comrades engaged in the analysis then feared causing bad relations and so backed down. Comrades of the enterprise itself have been even more scared, and some are blamed for leaking details of the enterprise's problems, while others have been transferred or dropped from their posts. What is the problem? The answer is that some comrades being afraid of uncovering contradictions is actually a result of them shielding shortcomings. What advantage is there in shielding shortcomings? If contradictions are not revealed and not resolved, how can there be any progress? The leading comrades of our organs and enterprises must stress the party's cause and must have a spirit of self-criticism and criticism. They must be brave in facing the problems squarely and must support the economic research workers and lower-level cadres being brave in uncovering contradictions and putting forward ideas, and being responsible to the party and to work. It should be recognized that economic results analysis is the carrying out of criticism and self-criticism in economic work. It is a strength for an enterprise in preventing economic stagnation and in promoting economic development. We must master this sharp weapon, which will allow us continually to progress.

3. We must grasp the major contradictions and key questions. If, in economic results analysis, each and every matter is noted, everything is just touched on lightly, and the tender spots are not grasped, we will not be able to resolve all the problems. All leaders must be brave in grasping key problems and in grasping the major contradictions in various complex situations. For example, at the large-scale iron and steel joint enterprises economic results analysis meeting in 1985, the comrades from Anshan Iron and Steel Works put forward that it was necessary to analyze the results of the technical transformation of the Anshan Iron and Steel Works during the period of the Sixth 5-Year Plan. This is a key qu-stion and must be grasped firmly. The Ministry of Metallurgical Industry and the comrades from Anshan Iron and Steel Works must together analyze the experiences and problems of Anshan Iron and Steel Works in improving economic results during the period of the Sixth 5-Year Plan, and study how to do things during the Seventh 5-Year Plan. This is known as facing up to hard problems, and one must have bold vision and the will to handle them. The comrades from the Tianjin Metallurgical Bureau pointed out that a key point in the technical transformation of Tianjin's iron and steel industry was the obtaining of its own supplies of pig iron. This is where the contradiction lay in Tianjin. If one is to produce steel, one must have iron. If this problem was not resolved, in future the difficulties would become greater and greater. After grasping the major contradictions, they discovered that it was an internal problem and that they had to resolve the problems connected with the growth of county-level iron plants. We must help them resolve this problem and relevant leading comrades must personally take hold of this matter. The comrades from the Wuhan Iron and Steel Works pointed out that the direction of their technical transformation is, with the precondition of raising product quality, to achieve the "double 600." The aim is correct, but as soon as the Baoshan Iron and Steel General Plant's continuous hot roller was put into production, the Wuhan Iron and Steel Work's over 1 million tons of steel blanks all went, and it was necessary to return to the 1984 level, and economic results became a problem. It has been learned that the (Bao Gang) [0545 6921], the Taiyuan Iron and Steel Company, the Panzhihua Iron and Steel Company, the Benxi Iron and Steel Company, the Ma'anshan Iron and Steel Company, and the Shanghai Iron and Steel Company have all paid attention to grasping their own major contradictions and key problems and have put forward the major problems in their own technical transformation. This is very good. At present, seen from the major contradictions and key problems in technical transformation, a common problem is that we must earnestly improve the results of investment in technical transformation. The funds for technical transformation during the Seventh 5-Year Plan are tigther than was the case during the Sixth 5-Year Plan. Thus, there is a feeling now that on the one hand funds are insufficient and on the other hand that the available funds are not being used well. Thus, all enterprises must grasp economic results analysis of the technical transformation carried out during the Sixth 5-Year Plan and from this sum up experiences and lessons, unify understanding, and do well in the technical transformation during the Seventh 5-Year Plan. If not, we will make mistakes that will affect history.

When analyzing their own major contradictions and key problems, the various enterprises must also pay attention to what the major contradictions and key problems are in the overall iron and steel industry. This will be of advantage, under the guidance of industry planning, in coordinating one's own development strategies and operational decisionmaking with that of the whole industry.

4. Economic results analysis must be systematized and regularized. The Ministry of Metallurgical Industry has already decided to develop economic results analysis in an overall way, and demanded that economic results analysis activities be regularly carried out at all levels from the ministry to the various enterprises, workshops, and groups. At the large-scale iron and steel enterprise economic results analysis meeting, the No 1 Shanghai Iron and Steel Factory introduced its experiences in yearly mobilizing the masses to "calculate detailed accounts and tap latent potential." At the beginning of each year, over about 1 month, they mobilize all the groups and teams to calculate detailed accounts of the whole factory's economic results and hand up reports on their calculations. From these, the factory formulates goals and measures for economizing, and very good results have been achieved. In the last few years, the rising prices of primary fuels, transport, and so on have affected the profits by 690 million yuan, an annual average of 125 million yuan. Through carrying out the above-mentioned activities, they have been able to readjust the product mix, develop diverse types of operations, and absorb the majority of the price changes. Profits have thus been maintained at a fairly good level.

The various enterprises must sum up their own situations and study methods by which to systematize and regularize economic results analysis. On the one hand, all factories, mines, and workshops must report at set times on their comprehensive or specialized economic results analysis. On the other hand, the corporations or factories must report at set times to the responsible department the situation of the enterprise's economic results analysis. In this way, economic results analysis will truly become a sharp weapon in the hands of the leaders and staff and workers at all levels, and this will promote the continuous improvement of enterprises' economic results.

5. Firmly grasp the measures, resolve the problems, and use analysis in improving economic results. The uncovering and analysis of contradictions are for the purpose of resolving those contradictions. It is necessary to put great efforts into analyzing the contradictions, but even greater efforts must be put into resolving the problems. Otherwise, it will result in the formalism of analysis for the sake of analysis, with the resultant waste of effort. That is to say, in the formula "practice; analysis; decisionmaking; further practice," practice has prime position and decisive importance in the resolution of problems. Analysis can point the direction of practice and thus has rational significance.

REPORTAGE ON HUNAN PEOPLE'S CONGRESS SESSION

Mao Zhiyong, Others Attend

HK250609 Changsha Hunan Provincial Service in Mandarin 0900 GMT 24 May 86

[Excerpts] The fourth session of the sixth Provincial People's Congress held a full gathering this morning. Responsible persons of departments concerned of the provincial government delivered speeches on wages, prices, and financial work. Mao Zhiyong, Xiong Qingquan, Jiao Linyi, and other responsible comrades were present.

Finance Chief Reports on Budget

HK270353 Changsha Hunan Provincial Service in Mandarin 0900 GMT 26 May 86

[Excerpts] (Xu Baoyuan), director of the provincial finance department, delivered a report to the Provincial People's Congress session on the final accounts for 1985 and the budget for 1986.

He said: The province's financial revenue last year was 3,919 million yuan, representing 120.6 percent of the budgeted figure of 3.29 billion yuan. Revenue topped 1984 by 531 million yuan, a rise of 16.6 percent.

However, there were also some problems: 1) Enterprise economic results were not good enough. The plans for lowering production costs and reducing deficits were not fulfilled. 2) The financial management standard of the fiscal and taxation departments is not high. There are still many loopholes in revenue and expenditure management. 3) Some counties and cities were unable to balance their budgets and were in deficit at yearend. We must seriously solve these problems in our future work.

He said: The province is budgeting for a revenue of 4,422 million yuan this year. After making deductions for price subsidy expenditures, this will represent an increase of 320 million yuan over 1985. We must do a good job in the following tasks:

1. Further invigorate the enterprises, promote lateral economic ties, and stimulate increased output and income. We must focus on large and medium enterprises in carrying out technological transformation. Efforts

must be made to cut production costs and to make new progress in reducing deficits and increasing surpluses.

2. Make vigorous efforts to organize revenue and ensure its steady growth. We must further step up tax collection work.

3. Strengthen and improve macroeconomic controls. We must pay attention to controlling and economizing expenditures.

4. Strengthen financial supervision and resolutely correct unhealthy trends.

(Xu Baoyuan) said in conclusion: For various reasons, the province's budget performance in January and February was not good enough. An improvement started in March, and we have now basically got onto a normal track.

DEPUTY MINISTER IN PAKISTAN--Islamabad (PAP). The Deputy Minister of Foreign Affairs, Jan Majewski, was in Pakistan where he was received by the Minister of Foreign Affairs Sahibzada Yacooba Ali Khan, the Minister of Energy and Water Resources, Jacal Sald Miana, and the Minister of Trade, Mohyuddin Baluch. He also spoke with the manager of the Ministry of Production Hasan Zaheer. Majewski held political consultations with the acting Federal secretary for Foreign Affairs Abdul Sattar. An exchange of views regarding Polish-Pakistani relations took place, especially as regards economic relations. They also discussed certain international problems, in particular the issues confronting Asia and Europe. [Text] [Warsaw TRYBUNA LUDU in Polish 18 Mar 86 p 7] /7358

SOVIET, POLISH JOURNALISTS MEET--The Journalist Cluc "Przyjazn" of the Association of Journalists of the PPR [SDPRL] hosted a meeting of Polish journalists with representatives of the Soviet press, devoted to the problems connected with the recently completed 27th CPSU Congress. Vladislav Ivanov, deputy editor -in-chief of SOVIETSKAYA ROSSIYA, shared his reflections on the Congress and Soviet policy. Sergey Dardykin, commentator for IZVESTIYA, spoke on the international significance of the Congress's discussions and resolutions. [Text] [Warsaw ZYCIE WARSZAWY in Polish 19 Mar 86 p 2] /7358

SOVIET, POLISH LAWYERS AGREEMENT--An agreement of cooperation between the Association of Soviet Lawyers and the Association of Polish Lawyers [ZDP] was signed in Moscow. The Minister of Justice of the Russian FSSR, A. Sukharev, acting president of the Association of Soviet Lawyers, signed the document, as did Z. Czeszejko-Sochacki, chairman of ZPP. [Text] [Warsaw TRYBUNA LUDU in Polish 20 Mar 86 p 7] /7358

PZPR UNIVERSITY COMMITTEES MEET--A conference of first secretaries of PZPR university committees from all institutions of higher learning was held in Warsaw on 20 March 1986. Also participating were the secretaries of the PZPR voivodship committees, who supervise party work at universities and scientific institutions. The conference dealt with the tasks assigned to the academic party organizations in implementing the resolutions of the PZPR CC 24th Plenum and those resulting from the 3d Congress of Polish Science. Professor Boguslaw Kedzia, Director of the Education and Science Department, presented the program of activities in this area, emphasizing the need for a broad participation on the part of academic centers in the pre-Congress discussions. Also mentioned during the course of the discussions was the need to publicize, on a broader scale, the achievements of the 24th plenary session of the CC within academia. Professor Tadeusz Porebski, Politburo member and PZPR CC Secretary, chaired and summarized the proceedings. [Text] [Warsaw TRYBUNA LUDU in Polish 21 Mar 86 p 5] /7358

ARMY PZPR CONTROL COMMISSION--The PZPR Control Commission of the Polish Army met on 20 March 1986 to discuss previous activities and suggestions for work to be done in advance of the Congress. Deputy Chairman of the Central Party Control Commission, Tadeusz Nowicki, and First Deputy for the Chief of the Main Political Directorate, Polish Army, Rear Admiral Ludwik Dutkowski, took part in the session. [Text] [Warsaw TRYBUNA LUDU in Polish 21 Mar 86 p 5] /7358

POLISH-MONGOLIAN CULTURAL COOPERATION--Ulan Bator (PAP). An agreement was signed on Wednesday [19 March 1986] implementing a Polish-Mongolian international agreement in cultural and scientific cooperation for the years 1986-1990. [Text] [Warsaw TRYBUNA LUDU in Polish 21 Mar 86 p 7] /7358

ZSL PROPAGANDA MEETING--Members of the presidium of Voivodship Committees and of directors of ZSL voivodship committee departments held a conference in Warsaw to discuss the party's political-propaganda efforts for 1986 resulting from, among other things, ZSL participation in pre-Congress talks. Wladyslaw Loranc, director of the PZPR CC Ideology Department, discussed the draft program of the 10th PZPR Congress. [Text] [Warsaw ZYCIE WARSZAWY in Polish 21 Mar 86 p 2] /7358

WARSAW POLYTECHNIC PARTY MEETING--A party meeting of several departments of the Warsaw Polytechnic, with the participation of a number of non-party employees, took place on 21 March 1986. The meeting dealt with the preparations to the 10th Party Congress; PRON's National Council General Secretary, Jerzy Jaskiernia, participated in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 22-23 Mar 86 p 5] /7358

POLISH-YUGOSLAV CULTURAL COOPERATION--A cultural agreement between Poland and Yugoslavia for the years 1986-1988 was signed in Belgrade on 18 April 1986. The agreement allows for the continuation of cooperation in all facets of cultural life. It also provides the basis for establishing contacts between those institutions not previously partaking in the cooperative program. [Text] [Warasw TRYBUNA LUDU in Polish 22-23 Mar 86 p 6] /7358

CENSOR OFFICE AKTIV MEETS--Candidate member of the Politburo and PZPR CC secretary Jan Glowczyk met with senior party and staff officials of the Main Office for the Control of Publiciations and Public Performances. Also participating in the session were directors and first secretaries of primary party organizations of regional publications and performance control offices. Glowczyk discussed the current sociopolitical situation and identified the tasks issuing from it facing the press, radio and television. [Text] [Warsaw ZYCIE WARSZAWY in Polish 22-23 Mar 86 p 2] /7358

PZPR THEORETICAL ORGAN EVALUATED--PZPZ CC Secretary Henryk Debnarski chaired a meeting of the program council of the national PZPR theoretical periodical, MYSL MARKSISTOWSKA. The meeting's purpose was to evaluate the output of the periodical after its first year and to determine the tasks for the current year. [Text] [Warsaw ZYCIE WARSZAWY in Polish 22-23 Mar 86 p 2] /7358

PUSHKIN INSTITUTE IN WARSAW--A. Pushkin Institute for the Russian Language was established in Moscow for the express aim of increasing the level of familiarity with the Russian language throughout the world. One of the Institute's outposts abroad is the Warsaw branch of the Moscow Institute. The 10-year anniversary of the founding of this academic center was recently celebrated. In addition to representatives of Polish academia, guests from the Soviet Union also took part in the celebrations. [Text] [Warsaw ZYCIE WARSZAWY in Polish 22-23 Mar 86 p 2] /7358

KRAKOW PARTY AKTIV MEETS--In the Party draft program one finds many goals but too few instructions on how to reach these goals--such was the opinion stated at a meeting of party aktivs of the Krakow city voivodship on 22 March 1986 with Marian Orzechowski in attendance. During the course of the debate on the draft party program it is being pointed out that even if, having learned a lesson from the sad experiences of the past we are now drafting more cautious programs, we still can not afford to deal exclusively in "step-by-step" policies. Referring to the questions raised during the meeting, M. Orzechowski recalled that even though after 31 December 1981, propositions were made--within the very bosom of the party--to depart from the resolutions of the 9th Party Congress, this was not done. Today we go forth to the 10th Party Congress seeking answers to two fundamental questions: how were the resolutions of the extraordinary congress implemented? And how does one construct a forward-looking program for the nation reaching into the 21st century, based on the spirit of those resolutions and on the experiences of the last 40 years? [Text] [Warsaw TRYBUNA LUDU in Polish 24 Mar 86 p 2] /3758

BUSINESS DIRECTORS SEMINAR--One in a series of seminars for the leading aktivs of those business enterprises which continue to be a focal point of interest to the PZPR CC was held on 21-22 March 1986. They discussed the conditions of creating and instituting a strategic policy for the enterprises and also the problems of cooperation between the director, the self-management organs, party and trade union organizations. M. Wozniak, Politburo member and CC secretary, met with the participants, during which time he presented the crucial issues relating to Poland's development in the context of the preparations for the 10th Party Congress. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Mar 86 p 2]

RADIO, TV COMMITTEE MEETING--Party aktivs and management personnel met in conference on 22 March 1986 in the Committee for Radio and Television Affairs to discuss the tasks of radio and television in the pre-Congress campaign period. Edward Kwasizur, First Secretary of the PZPR CC, chaired the proceedings, and Jan Glowczyk, candidate Politburo member and secretary of the CC, summed up the session. In addition, Bogdan Jachacz, director of the CC Propaganda Department, and Miroslaw Wojciechowski, Chairman of the Committee for Radio and Television Affairs, took part in the meeting. [Text] [Warsaw TRBYUNA LUDU in Polish 24 Mar 86 p 2] /7358

EDITORS OF PARTY DAILIES MEET--(Staff report) On the initiative of TRYBUNA LUDU, another in a series of meetings of the editors-in-chief of the PZPR dailies took place in Kazimierz. This time the meeting dealt with the tasks facing the party press in the period prior to the 10th Party Congress. The meeting was hosted by the editors of SZTANDAR LUDU. During the discussion, references were made to the resolutions of the 27th CPSU Congress, the deliberations of which were described by Jerzy Majka, editor-in-chief of TRBYUNA LUDU. The need for a greater aggressiveness on the part of the press was emphasized, as well as a closer connection between the topics explored in the newspapers and the problems which the working class and all of society face on a regular basis. Representatives of the Propaganda Department of the PZPR CC along with Department director Bogdan Jachacz took part in the proceedings, Andrzej Szpringer, First Secretary of the PZPR Voivodship Committee in Lublin and the vicepresident of the "Prasa-Ksiazka-Ruch" Worker's Cooperative Publishing House, Alina Tepli, also took part. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Mar 86 p 5]

YOUTH MEETING ON PROGRAM DRAFT--The party draft program was the subject of a two-day conference of the National Council of Young Science Workers of the Association of Polish Students [ZSP], which ended on 23 March 1986 in Rynia near Warsaw. Discussion centered on issues in the draft program relating to problems of special concern to academic centers that have an impact on the future of higher education and the role of science and learning in the life of the nation. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Mar 86 p 5] /7358

POPULARIZATION OF KNOWLEDGE MEETING--A two-day national seminar organized by the Main Administration of the Society for the Popularization of Knowledge [TWP] opened in Lodz. The main theme of the seminar was the consolidation of socialism as the direction of Poland's development. Secretaries of the voivodship administrations and TWP lecturers and activists from throughout Poland took part in the discussions, which examined TWP activities prior to the 10th PZPR Congress. In connection with this year's celebration of the International Year of Peace, TWP is organizing, with the cooperation of the Main Administration of the Society for Soviet-Polish Friendship, a seminar with Polish and Soviet lecturers dealing with the problems of the peace initiatives of socialist countries, to be held in April [1986]. [Text] [Warsaw ZYCIE WARSZAWY in Polish 15-16 Mar 86 p 2] /7358

MICROCOMPUTER CLUBS SEEK EXPANSION--A national meeting of Scout Union computer clubs and of those persons supervising the activities of these clubs was held in Warsaw. Over 100 representatives of micro-computer clubs functioning under the patronage of the Polish Scout Union [ZHP] throughout Poland discussed such issues as the clubs' potential and development program, the chances of acquiring computer parts and programming, and the clubs' personal and housing conditions. A representative from the Office for Youth Affairs of the Council of Ministers was on hand to present a plan for the development of microcomputerization among youth and the means of subsidizing the activities of the microcomputer clubs. [Text] [Warsaw ZYCIE WARSZAWY in Polish 15-16 Mar 86 p 2] /7358

STUDENT ASSOCIATION PLENUM--The tasks of University Councils in the organization of student life was the topic of a plenum of University Councils of the Polish University Students Association [ZSP] held on 15 March 1986. The resolutions issued at the plenum set forth the tasks of the ZHP in awakening a spirit of social organizational, and political activism. They also accepted the organizational foundations for this year's summer campaign among college students, which will be used to publicize the results of the 10th Party Congress, further broaden the involvement of the academic community in the life of the local regions and cities, and to undertake initiatives serving peaceful world development. [Text] [Warsaw TRYBUNA LUDU in Polish 17 Mar 86 p 5] /7358

ARMY LAUDS PATRIOTIC SOCIETY--[Staff Report] Gen Div Dr Tadeusz Szacilo, Chief of the Main Political Administration of the Polish Armed Forces, met with Edmund Meclewski, chairman of the "Wisla-Odra" [Vistula-Oder] Association and deputy in the Polish Sejm. E. Meclewski gave the chief of the Main Political Administration a briefing on the association's accomplishments and its plans for the near future. During the course of the meeting they discussed issues related to patriotic and civic education programs for the general public and the process of instilling the public, especially the younger generation, with an awareness of its historic and national identity. Gen Div Dr T. Szacilo expressed his high regard for the work and initiatives of the "Wisla-Odra" Association. He emphasized the important role it plays in the patriotic education of our countrymen, in cultivating the traditions of the struggle to preserve the Polish character of the western territories and to restore those lands to the Motherland, and also in efforts aimed at consolidating the western frontiers of the Republic and the inviolability of the Piast Dynasty [medieval] frontiers along the Oder and Neisse rivers. COUNCIL OF MINISTERS' TASKS TO ENSURE PLAN FULFILLMENT

Bucharest BULETINUL OFICIAL in Romanian Part I No 17, 4 Apr 86 pp 1,2

[Grand National Assembly Resolution No 1 on Council of Ministers Report Concerning Fulfillment of the Unified National Plan of Social and Economic Development of the Country in the First Quarter of 1986 and Measures to Ensure Full Implementation of the Provisions of the Plan for 1986]

[Text] The Grand National Assembly, having discussed the Council of Ministers Report concerning fulfilment of the Unified National Plan for Social and Economic Development in the first quarter of 1986 and the measures established to ensure full implementation of the provisions of the plan for 1986, finds that all economic and social activities have been conducted in the first quarter in the directions ensuring steadfast implementation during the first year of the 8th five-year plan of the historical resolutions of the 23th Congress of the Romanian Communist Party and execution of the party's program for creating a comprehensively developed socialist society and Romania's entry into a higher stage of development.

The Grand National Assembly expresses its high appreciation for the decisive contribution made by the secretary general of the party, the president of the Socialist Republic of Romania, Comrade Nicolae Ceausescu, to establishment and implementation of the entire policy of our party and state, to conduct of all activities on a thoroughly scientific and realistic basis, and to establishment of the most appropriate measures ensuring broad mobilization of the creative forces and energies of the people for the building of socialism and communism on Romanian soil.

Having considered the results achieved thus far in the economy and the measures established for full implementation of the provisions of the plan for 1986, the Grand National Assembly of the Socialist Republic of Romania hereby resolves the following:

1. The Assembly approves the Report of the Council of Ministers concerning fulfillment of the unified national plan of social and economic development of the country in the first quarter of 1986 and the measures established for full implementation of the provisions of the plan for 1986.

2. It requests the Council of Ministers to take action with the highest resolve to see that the ministries, other central and local authorities, and all economic units fully implement the measures established for the following purposes.

(a) exemplary fulfillment of the unified national plan of economic and social development and the special programs adopted for individual sectors and spheres of activity;

(b) regularity in manufacture of products, in terms of physical output and planned structure, improvement in the technical features and quality of products, and better utilization of raw and intermediate materials, fuels, and energy;

(c) manufacture of the full amount of products intended for export, in accordance with the quality requirements and delivery schedules specified in contracts.

Measures must be taken to make up the arrears in exports, with efforts applied to ensure regularity in manufacture of articles intended for export.

To ensure regularity in manufacture of goods for export, the Council of Ministers will take steps to make certain that the Ministry of Equipment and Materials Supply and Control of Fixed Asset Management will, together with the State Planning Committee, provide enterprises with raw and intermediate materials intended expressly for use in production for export which can be used only in production for export.

The ministries, centrals, and enterprises have the obligation of assigning priority to production and supply of materials required in production for export.

The use of raw and other materials intended for export for other purposes is to be considered a serious violation of the unified national plan and is to entail the imposition of penalties in accordance with the laws of the country.

(d) The creation of conditions for implementation of the investment program, commissioning of facilities, and achievement of the design parameters within the periods set, as well as for full utilization of existing production facilities and production areas.

(e) Improvement in the activities of organization of production and labor, modernization of manufacturing technologies and dissemination of technical progress, application of the flat rate and piecework systems and greater increase in labor productivity in all sectors of activity on this basis, reduction of the consumption of energy and materials, improvement in the coefficient of utilization of material resources, and reinforcement of order and discipline in all units.

(f) Full achievement of the planned targets connected with farm crop and livestock production, maximum efficiency in use of all land resources and equipment supplied; full implementation of the program of irrigation and other land reclamation projects; dissemination of advanced technologies of cultivation, harvesting, and livestock raising; promptness and high quality of execution of farming; and the greatest possible efficiency in provision and management of fodder resources.

(g) The Council of Ministers will take steps to liquidate surplus inventory and will report on the inventory situation to the Grand National Assembly at the next session of the Assembly.

(h) Steadfast application of the principles of worker self-management and autonomous economic and financial administration, to ensure full payment of expenses in every unit out of retained earnings, lowering of production costs and increase in profitability, increase in the value of output relative to the fixed assets used, adherence to the approved consumption standards, conduct of rigorous bank and financial auditing, institution of a strict system of conservation, and efficient management of national resources.

The Grand National Assembly finds that all the necessary conditions have been created for full implementation of the plan of economic and social development for 1986 and calls upon all workers to act with revolutionary resolve and selflessness to ensure better utilization of the entire material and human potential available to our society, so as to step up the pace of intensive and steady development of industry, agriculture, and the entire national economy, this forming a sure basis for ongoing elevation of the material and spiritual standard of living of our entire people, such elevation being the supreme goal of the policy of the Romanian Communist Party.

This resolution was adopted by the Grand National Assembly at its session of 3 April 1986.

Nicolae Giosan
President of the
Grand National Assembly

ACTIVITY, WORKS OF HISTORIANS IN 1985 VIEWED

Bucharest AMFITEATRU in Romanian Feb 86 p 8

[Article by Ion Calafeteanu: "The 1985 Cultural Year--Valuable Scientific Investigations in the Field of History"]

[Text] If one year is too short a period of time to draw any general conclusions concerning the development of Romanian history sciences, to formulate over-all characteristics concerning the methodology of inquiry, and, eventually, discern future lines of evolution, nevertheless this represents a period of time which allows certain findings and observations and, of course, the sketching of a balance sheet, all of which can constitute component elements of a comprehensive opinion over a longer period of time.

We begin our succinct annual retrospective review by underlining the variety of the themes to be treated, whose simple enumeration would have been absolutely sufficient to convey to us the size and extent of the process of inquiry into the past which Romanian historians have been and still are engaged in. It would be impossible for us to do that here. That is why we will be satisfied to show only that, for all practical purposes, all historical epochs which the development of human society has known, from the age of primitive communes to the age of the building of socialism, have been made the object of scientific investigation during the past year.

The subjects treated--and this is a constant in contemporary Romanian history sciences--were analyzed from the standpoint of historical materialism, which has allowed Romanian historians to accomplish some valuable scientific investigations, pointing out the profound causes of events and social phenomena investigated, depicting facts in an objective manner, fully in accord with historical reality.

The results obtained--some of them scientifically remarkable--could be published in the pages of specialized journals (among which we note ANALE DE ISTORIE, REVISTA DE ISTORIE, REVISTA ARCHIVELOR, MAGAZIN ISTORIC, LUPTA INTREGULUI POPOR, the annual publications of history institutes of Iasi and Cluj-Napoca and also the publications of the county history museums as well as other cultural publications) and also discussed during scientific reports sessions.

And, of course, through books. A look at the publishing year 1985 in the field of history allows us, in the first place, to emphasize the continuation of a collection of sources well-known to the specialists (we have in mind the series "Documenta Romaniae Historica"), the initiation of other ("Romania's Image Through Travelers,") the appearance of works concerning the beginning period of Romanian feudalism (Victor Spinei, "Ethnic and Political Realities in Southern Moldavia During the 10th-13th Centuries, Romanians and Turanians"; Sergiu Iosipescu, "Balita, Dobrotita, Ivancu") collections of studies titled "Romanian Medieval and Modern Civilization" (prepared by Nicolae Elian, Aurel Radutiu and Pompiliu Teodor) and "Romanian National Unity in the Modern Epoch, 1821-1918" (authors: Nichita Adaniloaie, Anastasie Iordache, Paul Oprescu,) George Potra's monographs on "The History of the Inns of Bucharest" and Dumitru Martinas on "The Origin of the Ceangai, the Hungarian-Speaking Population in Moldavia." Two works of historiography--both by Iasi historians and published in the collection "Biblioteca Historica" of the Academy's Publishing House--complete this scenario of concerns: V. Cristian, "The Contribution of Historiography to the Ideological Preparation for the Romanian Revolution of 1848" and Al. Zub, "From Critical History to Criticism, Romanian Historiography at the End of the 19th and the Beginning of the 20th Centuries." Alexandru Zub is also the editor of the Fourth Edition of "The History of the Romanians," by A.D. Xenopol, initiated by the Scientific and Encyclopedic Publishing House (of which the first volume appeared last year; text, notes, commentary and indexes by V. Mihailescu-Birliba) which, in its relationship and significance, goes beyond the strict bounds of history, becoming a true act of national culture.

Looked at through the prism of publications, the year 1985 makes itself felt, however, as a year dominated by works dedicated to the period after 1918 and, especially, to the years of the Second World War and the period immediately following. We illustrate, in this sense, with works authored by Gheorghe Iancu, "The Contribution of the Leadership Council Towards the Consolidation of the United Romanian National State, 1918-1920"; Olimpiu Matichescu, "History Does not Step Backward"; Marin Badea, "Under the Open Sky of the Month of May"; Liviu Dandara, "Romania in the Whirlpool of the Year 1939"; V. Malinschi, Economics, Law, Diplomacy According to Nicolae Titulescu"; Ioan Talpos, Mihai Retegan, Dan Radulescu, "The Defense of the Nation, The Principal Objective of the Romanian Antifascist Movement, 1933-1939"; Gheorghe Zaharia, Ion Cupsa, "Romania's Participation in the Defeat of Nazi Germany"; the volume "The National Antifascist Committee," (prepared by a group of historians from the Institute of Historical and Sociopolitical Studies of the Central Committee of the Romanian Communist Party); Volumes 3 and 4 from the collection of documents "23 August 1944, Documents. 1944-1947" (coordinators: Ion Ardeleanu, Vasile Arimia, Mircea Musat,) and also the work "The Horthyist-Fascist Terror in Northwestern Romania, September 1940-October 1944" (coordinators: Mihai Fatu and Mircea Musat).

We will close this succinct retrospective review with two points. The first refers to the affirmation on an international level of Romanian history sciences as a consequence of the publication of certain works in internationally known languages, of the activity of the publication REVUE ROUMAINE D'HISTOIRE, of requests for works and articles made to Romanian historians by foreign publishing houses and editorial boards (thus, nr 4/1985 of the prestigious REVUE D'HISTOIRE DE LA DEUXIEME GUERRE MONDIAL ET DES CONFLITS CONTEMPORAINES" published four articles signed by Romanian historians) also as a consequence of the participation of our country's historians in numerous scientific conventions abroad. We recall in this connection, that in 1985 the 16th International History Congress took place in Stuttgart, at which the delegation of Romanian historians made a valuable and prestigious scientific contribution.

The second point we wanted to make refers to a more energetic involvement during this past year by Romanian researchers in the field of history in combatting reactionary, antiscientific theories and certain chauvinistic tendencies which still manifest themselves on the international scene. There still exist today, unfortunately, historians who are apologists for territorial conquests, for the subjugation of other peoples, who are nostalgic about multinational empires of old which have been definitively condemned by the implacable laws of historical development, who deny the objective and just character of the formation of nation-states, who dispute borders currently existing in the world, encouraging--openly or covertly--revisionism and revanchism.

Combatting these destructive theories for the sake of promoting historical truth, of respect for the history of every people and of a clear understanding of the commandments of the current era represents the contribution of Romanian historians to the cause of peace, friendship and collaboration among all peoples of the world.

GRLICKOV DIFFERS WITH SAWPY COLLEAGUES ON 'CRITICAL ANALYSIS'

Belgrade BORBA in Serbo-Croatian 17-18 May 86 p 8

[Excerpt] In waging the public discussion on the Critical Analysis of the Functioning of the Political System, members of the Presidium of the SAWPY (Socialist Alliance of Working People of Yugoslavia) Federal Conference have not been in agreement on all assessments. If most of the 10 participants in the [Presidium] discussion stressed that in the public discussion quite a few constructive suggestions were heard..., there were some differences in the assessment, for instance, as to whether the Critical Analysis is "in conflict" with the economic stabilization program.

Jovan Dejanovic, president of the [SAWPY] section for development of the political system, said that "the opinion prevails that there are no essential differences between the Critical Analysis and the economic stabilization program, that the goals are the same, and that certain formulations which are in dispute can be brought into accord with further discussion and action." Dr Aleksandar Grlickov, president of the Federal Conference, was of a somewhat different opinion, since he said that there are 27 differences between these two documents [the Critical Analysis and the Long-Term Program of Economic Stabilization (DPES)], of which "some are imprecise formulations" while others reflect "somewhat basic differences." He added that in seven cases they [the formulations] are not "even connected with the Constitution."

Although members of the Presidium mostly dealt directly with the report drawn up on the basis of republic and provincial reports, as well as [the report of the] SAWPY work program in realizing the most important commitments from the Critical Analysis, some, like Marijan Kotar from Slovenia, advocated a clarification of "open questions." Kotar even said that agreement should be reached in the Federal Conference on the questions of consensus, on the above-mentioned differences between the Critical Analysis and the DPES, on the authority of the federation, the polemic surrounding [the question of whether there should be a federal] chamber of associated labor, and relations within the Socialist Republic of Serbia.

Aleksandar Grlickov offered a more realistic approach, foreseeing that there will be considerable discussion yet on these problems but that, one by one, they must be eliminated from the agenda if our political life is not to be burdened and all channels not fully blocked in the functioning of the political system.

Grlickov also said that discussions on the political system will inevitably continue in all bodies which have been working on constitutional and legislative changes, because there are no "finished solutions." As characteristic of our a-priori divisions he mentioned the discussions on the chamber of associated labor and on the question of consensus, displaying a wide dialectical approach to these questions in which consideration is given to the nationality and class components of Yugoslav society but also to the requirements of the modern world to which the "technology of decision-making" must adapt also.

Advocating more rapid enactment of concrete solutions, reminding participants in the debate that any amendment to the present Constitution requires 1 year [to enact], Grlickov said that the task of the Socialist Alliance is to change the "atmosphere of great expectations" to an "atmosphere of at least small changes" because after victories in small battles, wars are won, but [they are] not [won] in great expectations.

At this meeting the Presidium supported the proposal to elect Nenad Bucin as president of the Federal Conference of SAWPY for 1 year.

STUDENT PAPER RIDICULES KOSOVO OFFICIAL

[Editorial Report] Belgrade STUDENT in Serbo-Croation on 2 April 1986, page 3, carries a attack on a Kosovo official. The Belgrade University student weekly's customary unsigned chatter column opens with an alleged contemporary [the writer uses both Zagreb and Belgrade versions of the word] fairy tale: "Once upon a time there was a family of Albanians, some of whom worked abroad (what they did and how they left are irrelevant to the fairy tale). The family lived modestly, saved, deprived themselves and others, and with hard work over the years accumulated a certain amount of money, partly dinars and partly hard currency. This money the hard-working and honest Albanian family spent on a useful purpose, namely buying up property from their neighbors (who were in a hurry to catch a northbound train) for the modest price of 5 or 6 million dinars. To cut the fairy tale short, the aforementioned family lived happily forever after on that property." The columnist mockingly ascribes the fairy tale to Rahman Morina, Kosovo province secretary for internal affairs. In conclusion: "Every fairy tale is beautiful until it turns bloody."

END

In case of a person stealing or robbing mining products or other property of a mining enterprise or prospecting unit, in case of a person destroying mining or prospecting installations, in case of a person disrupting the production or work order in the mining or prospecting area, the judicial authorities shall consider criminal prosecution according to law. If the circumstances of the case are obviously not serious, a penalty may be imposed according to the Security Administration Punishment Act.

The said law, furthermore, establishes legal responsibilities in such separate cases as when a person exceeds his mining area, trades, rents or otherwise disposes of mineral resources, when a person trades, rents or mortgages his mining right, or in violation of regulations purchases or sells mining products for which the state has decreed centralized procurement, or when a person employs methods of a destructive nature in mining, leading to serious damage being suffered by the mineral resources.

DEVELOPMENT OF CIVIL AIRCRAFT GIVEN PRIORITY

Beijing ZHONGGUO JIXIE BAO in Chinese 20 Mar 86 p 1

[Article by Ge Yunchi [5514 6663 3069]: "Civil Aircraft Development A Priority During the Seventh 5-Year Plan"]

[Text] In accordance with the correct policy laid down by the CPC Central Committee, namely that domestic civil aviation in the future shall use Chinese-manufactured aircraft exclusively, the Ministry of Aeronautics will make the development of civil aircraft its top priority during the Seventh 5-Year Plan. In quantity, performance and quality, the production of civil aircraft in the next 5 years will surpass the entire 36 years following the establishment of the PRC.

Since the People's Republic was founded, China's aviation industry has seen uninterrupted growth and development. Today it is a powerful industry employing hundreds of thousands of workers and comprising hundreds of enterprises and scientific research units. Thus far it has manufactured close to 10,000 airplanes of all types, a vital contribution to the defense and development of the socialist motherland.

Since a strong defense is basic to the development of the motherland, the country's aviation industry has consistently considered the production of military aircraft its No 1 mission and limited its civil products to the occasional spinoffs from the R & D of military planes. Be that as it may, the industry has managed to turn out six or seven types of civil aircraft of various models, beginning with the birth of Transport 5 in October 1957, and has already developed the capacity to produce some of these planes in batches. They have proved highly useful in domestic transportation, disaster relief, geological survey, agriculture and forestry.

At present China's civil aircraft industry is concentrating on medium and small airplanes. Among planes being built through the batch process and sold commercially are Transport 5, 7, 8, 11 and 12; Helicopter 9; and three ultra-light planes, Bee 3, and Dragonfly 5 and 6. Characteristic of all the planes are their safety, reliability, lightness, versatility and economic efficiency. So far over 300 Transport 5's have been built, for extensive use domestically and for export to five nations, including Pakistan and Korea. As a special agricultural plane, Transport 11 is highly popular with major farms and forestry centers around the nation; 30 such planes are now in service. Transport 7 is the first medium or short-range feeder transport plane made by China. Its improved version, Transport 7-100, is a passenger plane that has caught the attention of foreign businessmen with its electronic navigation and cabin environment matching standards of the 1980's. Modelled on Transport 11, Transport 12 is a multipurpose civil airplane designed in accordance with relevant standards in US federal aviation regulations; it has obtained a model qualifying certificate from the Civil Aviation General Administration and is a prime candidate to pry open the international market. With a carrying capacity of 20 tons, Transport 8 is one of the only two medium-sized transport planes in the world today. A machine of great potential, it has flown over every province, municipality and autonomous region in the nation, except Taiwan, and made 23 trips to Xizang in the 10 years since it was first built. Helicopter 9, manufactured by China using patented technology imported from Yuhang Company of France, is a lightweight helicopter and also the first Chinese helicopter to obtain a foreign airworthiness certificate. The country's ultra-light planes--Bee 3, Dragonfly 5 and 6--are attracting more and more attention because of their safety, reliability, practicality and inexpensiveness.

To achieve the great objective of using only Chinese aircraft for domestic civil aviation as soon as possible, the State Council has decided to "allocate special R & D funds for civil aircraft, make such appropriations a separate budgetary item and incorporate them in the national plan." It has also defined its policies in the Seventh 5-Year Plan as follows: "Concentrate resources on the development of new feeder aircraft and special agricultural and forestry planes and make the utmost use of imported engines, electronic parts and other components in the domestic manufacture of aircraft in order to improve our models to meet the needs of modern civil aviation." This is a sign that the heyday of healthy growth for China's civil aviation industry has arrived.

RAW MATERIALS INDUSTRY DEVELOPS RAPIDLY IN ANHUI

Hefei ANHUI RIBAO in Chinese 9 Apr 86 p 1

[Article by Chen Baoshan [7115 1405 0810]: "Raw Materials Industry Makes Rapid Progress in Anhui"]

[Text] How to accelerate the development of the raw materials industry? A constructive approach by Anhui is to cooperate with neighboring provinces and municipalities also lacking in raw materials, share the fruits of joint development and make use of one's own strengths.

With its longstanding reputation as "the land of energy and raw materials in east China," Anhui abounds in such resources as coal, iron, copper, sulfur and limestone. Transportation in the province is also convenient. In the past, the government invested heavily in a number of key enterprises, boosting economic development in east China tremendously. However, limited funding has prevented the exploitation of vast quantities of resources. The output of the raw materials industry, in particular, falls far short of the needs of the situation.

The appearance of horizontal economic and technical cooperation has broadened people's vision and opened up a new way to quicken the pace of raw materials production. The local government wanted to put up a 300-cubic meter blast furnace at Wuhan Steelworks which has adequate resources and is accessible, but lacked the necessary funds. In the first half of 1985, Anhui cooperated with Shanghai's Metallurgy Bureau and relevant agencies in Jiangsu Province, shortly raising over 50 million yuan. Construction on the project began in the second half of 1985, with production scheduled for this year or early next year. Taking a similar tack to fund-raising, the building-materials, chemical and other industries in Anhui have also built or modernized a number of cement plants and marble works, thereby easing the shortage of building materials and chemical raw materials.

To promote cooperation and attract capital, the provincial government has drawn up preferential policies specifically for projects funded by a pooling of capital. Under past regulations, only after a project went into production were materials shared. Now Anhui is willing to supply the other party with materials when it has a dire need. In tax, industrial and commercial administration and transportation, too, the government tries to be as accommodating as possible. There is a huge limestone mine with 800 million tons of reserves at Sanxingshan in Tongling Shi. Last year, Anhui reached a trilateral agreement with Shanghai and the State Building Materials Bureau under which they would jointly invest in a large cement plant with an annual output of 1.5 million tons to be divided among the three partners. This project has won the support of the State Planning Commission and construction is to begin soon, with completion scheduled for 1990.

The joint development of the raw materials industry solves the problem of lack of funds as well as speeds up its pace. According to people in charge of the provincial Office of Cooperation, there have been over 50 large-scale cooperative projects, representing an infusion of capital exceeding 250 million yuan, in the raw materials industry between Anhui and its neighboring provinces and municipalities as well as relevant agencies in the central government in the little more than 3 years since 1983. Upon completion, the projects will produce 2.3 million tons of cement, 400,000 tons of pig iron and 600,000 tons of ferrous sulfate.

INDUSTRY

SATISFACTORY INDUSTRIAL GROWTH IN ANHUI IN FIRST QUARTER

Hefei ANHUI RIBAO in Chinese 9 Apr 86 p 1

[Text] With the vigor of a tiger, Anhui has been persisting in economic reform and forging horizontal economic cooperation in this Year of the Tiger. As a result, industrial production in the very first year of the Seventh 5-Year Plan has gotten off to a good start; according to the Anhui Statistical Bureau, gross industrial output value in the first quarter of 1986 went up 8 percent over the same period last year.

As we enter the first year of the Seventh 5-Year Plan, factories, mines and other enterprises in the province have further improved all kinds of economic responsibility systems and stepped up output in such heavy industries as iron, steel, coal and electricity generation. During the first quarter, key heavy industrial products, including pig iron, steel, rolled steel, soda, caustic soda, raw coal, electricity and cement all fulfilled plan quotas and registered substantial gains over the corresponding period in 1984. The growth rates for steel, rolled steel, raw coal, electricity generation and cement were 6.1, 4.2, 0.5, 9.8 and 32.2 percent respectively.

In accordance with the demands of the Seventh 5-Year Plan, the province has vigorously pursued all manner of cooperation and expanded the production of light industrial consumer goods. Hence the 13.5 percent increase in gross output value in light industry compared to the first quarter in 1984. Economic efficiency too has gone up. The production of domestic refrigerators, beer, watches, machine-made paper and cardboard has doubled in volume. The total value of textile exports has risen by more than 50 percent.

OPEN DOOR POLICY BOOSTS GUANGDONG TEXTILE INDUSTRY

Guangzhou KAIFANG [OPEN POLICY] in Chinese No 3, 8 Mar 86 pp 22-24

[Article by Li Chi [2621 3589]: "Guangdong Textile Industry Making Rapid Progress"]

[Text] The textile industry is one of Guangdong's oldest industries. For years, however, the province has been conditioned by "leftist" ideas and outdated thinking into believing that since it does not produce cotton and is a coastal province with frontier defense responsibilities, it is not suited to develop a textile industry in any serious way. Up to the 3d Plenum of the 11th CPC Central Committee, therefore, textile industry in the province had made little progress, what with its obsolete equipment and technology and unsound industrial structure: Spinning accounted for a larger share of the industry than weaving, which, in turn, was more important than dyeing. Outdated equipment was commonplace, technology was lacking, the managerial standard was low and the products uncompetitive.

After the 3d Plenum of the 11th CPC Central Committee, Guangdong welcomed the arrival of spring in its textile industry. Leaders at all levels--provincial, municipal, prefectural and county--consider the development of the industry a priority and make use of the open door policy, the province's proximity to Hong Kong and Macao and its large number of overseas Chinese to raise capital through a variety of channels: compensation trade, the three forms of import processing, joint ventures, bank loans and local fund-raising. Advanced equipment and technology was introduced at various levels, through various channels and in various ways, resulting in an embryonic but relatively comprehensive textile industry. Statistics show that since 1979, 82 local enterprises throughout the province have successively spent $317 million in foreign exchange importing a total of 6,622 plants or single pieces of key machinery. In 1984 and 85 alone, technical modernization, infrastructural development, joint ventures, the three forms of import processing and compensation trade accounted for 623 million yuan of budgetary allocations. At present the imported technology is being put into production one after another and has been instrumental in accelerating the development of the province's textile industry, increasing variety, color and design, enhancing the competitiveness of its products and stepping up exports. The industry's gross output value reached 3.406 billion yuan in 1985, 497 million more than the 1984 figure of 2.549 billion yuan, an increase of 19.49 percent, the highest in the industry nationwide. The province's textile industry fulfilled the target in the Sixth 5-Year Plan 14 months ahead of time and doubled its output value 61 months earlier than planned. In gross industrial output value, it ranked 10th nationwide, up from 13th. State-owned textile enterprises netted 222 million yuan in profits in 1985, 45.99 percent more than in 1984. Their taxes and profit taxes amounted to 138 million yuan and 207 million yuan respectively, representing gains of 23.65 percent and 17.48 percent over 1984. For the second year in a row, output value, taxes and profit taxes all went up simultaneously.

Premier Zhao Ziyang has pointed out, "In importing technology, we must set our sights at the highest level in the world and should not repeat what others have done. Moreover, we must coordinate the import of key equipment. The modernization of technology must go hand in hand with that of equipment." We must decide the focus of our import policy based on the spirit of the premier's instructions. As far as guiding ideas are concerned, we have gone out of our way to achieve the "four combinations," ie., combining the import of advanced technology and equipment with the technical modernization of old enterprises, with the effort to lay the groundwork for overtaking the world's advanced nations, with the export drive, and with new product development. Specifically, we have "come to grips with the two ends, led the middle, and emphasized one aspect." In other words, we have expanded our cotton spinning capacity, developed the chemical fiber raw materials industry to provide raw materials for knitting and weaving enterprises, and upgraded printing and dyeing facilities to adjust the imbalance between weaving and subsequent treatment. Before 1979, we met 60.08 percent of the province's cotton yarn requirements. Now we produce enough cotton yarn to satisfy the needs of the weaving, knitting and reproduction industries, with a little surplus for export. A good deal of efforts has also been made to develop the chemical fiber raw materials industry: a host of mainstay enterprises have been built in recent years, including the Xinhui Polyester Fiber Plant, the Foshan Chemical Fiber Plant and the Guangzhou Synthetic Fiber Plant, and existing chemical fiber enterprises have been expanded, so that there has now emerged a fledgling production system for six major categories of chemical fiber raw materials--polyester staple fiber, polyester fiber filament, polypropylene fiber filament, viscose fiber, fiber, and polyamide fiber. In 1985, the output of chemical fiber raw materials reached 31,065 tons, a 5.15-fold increase over the 1978 figure of 5,054 tons. During the same period, annual printing and dyeing capacity expanded 4.04-fold from 37.73 million meters to 190 million meters. Before 1979 cotton cloth printing was nonexistent; today its annual output stands at 2,500 meters.

Long praised as "the flower of the south," knitwear is one of the stronger sectors of Guangdong's textile industry. It enjoys a good reputation at home and abroad and is a promising vital industry. To upgrade its knitwear products and put an end to its historical dependence on the "three traditional types" of product, namely, sweat shirts and pants, cotton shirts and pants and vests, Guangdong must increase product variety, including color and design, and step up export. Through such mechanisms as import processing and loans, the province has imported 3,760 plants or sets of knitwear equipment since 1979, 56.78 percent of all its imported equipment. No longer does the knitwear industry turn out only pure cotton goods. Guangdong No 4 Knitwear

Factory, for example, was mostly fitted with equipment dating from the 1920's and 30's and had only 800,000 yuan in fixed assets. In recent years, it adopted the method of "borrowing a hen to lay eggs and selling the eggs to buy hens," and imported 235 pieces (sets) of advanced equipment to replace 70 percent of its old machinery. While it used to produce just one line of product previously, it has now matured into an export-oriented enterprise turning out a dazzling variety of goods, from thick to medium to thin. Its profits have risen more than 200 percent compared with the pre-modernization days.

Guangdong's drive to import equipment and technology in recent years has been marked by an emphasis on "suitability," "excellence," and "promptness." Efforts have also been made to "keep up" with the imports.

"Suitability" means importing the kind of advanced technology and equipment best suited to fill the nation's and province's technical void. We must aim high, transcend the conventions of technological development and make the world's latest technology today serve China. Among the technology and equipment imported by Guangdong is some which is of the standards of the late 1970's and early 80's. A large part of it has helped fill the gaps in China's and Guangdong's scientific and technical know-how, eg., the "compact" high-speed polyester-fiber spinning machinery imported by Xinhui Polyester Fiber Plant; "compact" FDY high-speed spinning machinery for both polyester fiber and polypropylene fiber, imported by Xinhui Synthetic Fiber Plant; and a production line for polymerization, the reeling off of raw silk from cocoons, weaving, dyeing and polyamide fiber, imported by Xinhui Dyeing and Weaving Factory as an assimilation project incorporated in the Seventh 5-Year Plan for the 1980's. Both the warp knitting equipment at Heshan General Woollen Mill and the high-pressure hosing equipment for polyester fiber and polyamide fiber lining glue imported by Foshan Woolen Sweater Company supplied China and the province with something they lacked before.

"Excellence" means selecting quality equipment that is advanced by international standards and adapts well to China's conditions. Over the past few years, before we imported a piece of technology, we first tried to understand its technical functions, price and the availability of parts and components. We insisted on comparison shopping and avoided rushed or shortsighted purchases, an approach now proved by facts to have ensured that the import would later be put into production successfully. Of our imports now in service, basically every single item went into operation without a hitch and has been performing satisfactorily since then, turning out products that are competitive on account of both their quality and their diversity.

"Promptness" refers to the speediness with which project negotiations proceed, a deal is clinched, infrastructural facilities go up and a project pays off. Judging from the experience of several major imported projects in Guangdong involving chemical fiber, knitwear, wool spinning and cotton spinning plants, it usually takes a year and a half, but sometimes as soon as a year, for a project to get off the ground, from infrastructural development through the installation of equipment to trial production. These projects were able to go into operation quickly because, first, the provincial government has given the localities and enterprises considerable discretion in the application of relevant policies and regulations. Second, leaders and agencies at all levels take the textile industry seriously and support it. When a major project is at stake, a leader in the local government will always take charge of coordinating its various aspects, such as capital, materials, site formation and construction to make sure things actually get done. Third, provincial corporations plan comprehensively and allocate rationally on a macroeconomic scale. They support any local projects as long as they meet policy requirements, satisfy overall provincial allocation needs, have guaranteed sources of funding and raw materials and marketing channels, and are economically efficient. What is more, they give concrete assistance to the enterprises to help them overcome the problems encountered in the course of putting up a project, and smooth their relations with units above and below to ensure that the project is completed, goes into operation and begins generating income without delay. Where the project concerned is of great significance or sets a trend, the leadership of provincial corporations will get personally involved in solving the detailed problems attendant upon project development.

"Keeping up" means providing personnel with technical training to enable them to handle the project in question. After a project is finalized, we always train the "horseman even before the horse is here," that is, we select a batch of key personnel and send them abroad or to relevant factories within China for training. We also invite experts to give lectures. When the plant is completed, the personnel will be well equipped to perform their duties. That is why technology and equipment imported by the province has basically been able to operate successfully at the very first trial.

The import of advanced technology and equipment has laid a solid foundation for the development of the province's textile industry. During the past few years, we have organically integrated technology import with the development of new product lines and the diversification of design and color to satisfy market demand and enhance product competitiveness. We have also expanded the application of imported equipment from one raw material to several. Since 1981, textile industry throughout the province has trial-manufactured 32,020 "four-new" items, of which 801 were new products, 10 won the silver shield awards of the state, 26 received the outstanding quality awards made by the Ministry of Textile Industry and 57 captured the province's outstanding quality awards.

With an eye to balancing our foreign exchange, we have taken pains in recent years to coordinate vital equipment that would help our export drive, even as we imported advanced technology and equipment in the form of plants. Statistically, the province's textile industry earned $1.133 billion in foreign exchange from 1979 through 1985, 3.57 times its expenditures of $317 million on technical import. Take, for instance, Guangdong No 1 Cotton Mill, an old enterprise which used to make primarily cotton cloth and cotton yarn. To upgrade its products and increase exports, the mill since 1979 has acquired from Hong Kong through compensation trade and import processing a complete set of spinning, weaving, dyeing and treatment machinery for manufacturing indigo denim. After the equipment went into operation, the mill produced a total of 36.79 million yards of denim from 1982 through 1985, of which 27.63 million yards, or 75 percent, were exported, earning $31 million in foreign exchange on sales of 108.95 million yuan. Its foreign exchange earnings represent five times what it spent to import the entire plant.

At present a number of problems remains in project planning. For example, most projects are still of the extensive type and few old factories have really been modernized; domestically-oriented projects outnumber export-oriented ones; more enterprises spend foreign exchange than earn it; and a lag exists between technology import and technology absorption and assimilation. All this awaits solution through our continuous efforts.

ZHEJIANG INDUSTRIAL OUTPUT UP 9 PERCENT IN FIRST QUARTER

Hangzhou ZHEJIANG RIBAO in Chinese 11 Apr 86 p 1

[Text] In Zhejiang, leaders at all levels attach a good deal of importance to industrial production and insist that it grows at an appropriate rate on the basis of improving economic efficiency. During the first quarter, gross industrial output value for the whole province rose 9 percent over the same period last year, while gross light industrial output value increased 10.7 percent; the momentum for sustained, steady and balanced growth has been maintained.

Earlier some comrades took a one-sided view toward the issue of growth rate, believing that "slow growth is better than fast growth." This notion, coupled with the half-hearted efforts to implement economic responsibility systems within enterprises and the lack of raw materials, has definitely affected production. Based on their in-depth studies, provincial government leaders stress that leading comrades at all levels must correctly interpret the growth rate issue in an overall context. On the one hand, they must say no to the kind of unchecked fast growth that pays no need to the constraints imposed by limited financial and material resources and the capabilities of the various quarters. On the other hand, they must take into account growing social needs and do all they can to tap every potential, raise production, improve supplies and ensure an appropriate rate of economic growth, on condition that product quality is improved, the consumption of energy and raw materials is reduced and economic and social efficiency is emphasized.

With a unified understanding of growth rate matters, leaders at all levels, from provincial through municipal and prefectural to county, have generally intensified their guidance over economic work and made thorough on-site investigations to solve problems. The Zhejiang Economic Commission and departments in charge of industry at all levels have improved the production regular meeting system and promptly overcome production problems. These departments, together with others in charge of materials, grains and transportation and banks have supported and closely cooperated with one another, doing their best to provide enterprises with materials like industrial salt and industrial grains as well as capital to ensure their normal production. Everywhere industrial departments have taken an array of measures to substantially boost the output of popular articles of daily use that are in great demand. Statistics show that of 40 categories of light industrial products, 34, or 85 percent, registered a gain in output in the first quarter compared with the same period a year ago. The increases were particularly impressive for domestic electric appliances and daily consumer goods; refrigerator and radio cassette recorders output went up 156 and 143 percent, respectively. The gains in watches, electric fans, woolen goods, beer, canned food and glass of daily use ranged from 20 to 83 percent.

CONSTRUCTION

MAJOR HIGHWAY PROJECTS IN SEVENTH 5-YEAR PLAN

Chengde JINGJI XIAOXI in Chinese 11 Apr 86 p 5

[Text] Of the 42 roads scheduled to be built during the Seventh 5-Year Plan, 27 are major highways, as follows:

(1) Beijing-Tanggu Expressway. 142.5 km.

(2) Beijing-Shenyang Highway. Conversion to Class 2 (and Class 1 in part), 346 km.

(3) Shenyang-Dalian Highway. New construction and conversion to Class 1, 390 km.

(4) Shenyang-Harbin Highway. Conversion to Class 2, 450 km.

(5) Siping-Hunjiang Highway. New construction and conversion to Class 2, 273 km.

(6) Suifenhe-Qiqihaer Highway. New construction and conversion to Class 2 and 3, 390 km.

(7) Xilinhaote-Saihantala Highway. Conversion to Class 3, 354 kilometers.

(8) Taiyuan-Yuncheng Highway. New construction and conversion to Class 1, 8 km, and Class 2, 292 km.

(9) Shanghai-Nanjing Highway. Conversion to Class 1, 5 km, and Class 2, 275 km.

(10) Shanghai-Hangzhou Highway. Conversion to expressway, 21 km; Class 1, 24 km; Class 2, 116 km.

(11) Hefei-Nanjing Highway. Conversion to Class 1, 135 km.

(12) Nanjing-Hangzhou Highway. New construction and conversion to Class 2, 118 km.

(13) Fuzhou-Xiamen Highway. Conversion to Class 2, 266 km.

(14) Jinan-Qingdao Highway. New construction and conversion to Class 1, 300 km.

(15) Shangrao-Pingxiang Highway. Conversion to Class 2, 208 km.

(16) Nanchang-Jiujiang Highway. New construction and conversion to Class 1 (one lane), 125 km.

(17) The eastern route of the beltway on Hainandao. New construction and conversion to Class 2, 272 km.

(18) Nanjing-Beihai Highway. Conversion to Class 2, 198.5 km.

(19) Liling-Xinhuang Highway. New construction and conversion to Class 1, 18 km; Class 2, 40 km.

(20) Luocunkou-Kunming-Wanding Highway. Conversion to Class 2 and 3, 557 km.

(21) Chinese section of the Chinese-Nepalese Highway. New construction and conversion to Class 3, 134 km.

(22) Lintong-Xian-Tongchuan Highway. Conversion to Class 1, 129 km.

(23) Chinese section of the Chinese-Pakistani Highway. Conversion to Class 3, 420 km.

(24) Baotou-Lanzhou Highway. Conversion to Class 2, 460 km.

(25) Lanzhou-Xining Highway. Conversion to Class 2, 129 km.

(26) Xining-Guoluo. Conversion to Class 3, 233 km.

(27) Guangzhou-Zhuhai. New construction and conversion to Class 2, 100 km.

JOINT CONFERENCES PROMOTE SINO-U.S. TRADE

HK210824 Beijing GUOJI SHANGBAO in Chinese 12 May 86 p 1

[Report by reporter Hao Ping [6787 1627]: "Promote Continuous Development of Sino-U.S. Trade"]

[Text] At the invitation of American Vice President George Bush, Vice Premier Yao Yilin left Beijing on an official visit to the United States on 12 May. As the chairman of the Chinese side, Vice Premier Yao will co-chair the fourth meeting of the Sino-U.S. Joint Commission on Commerce and Trade to be held in Washington.

Since 1981 when former U.S. Secretary of State Haig visited China and suggested establishing the Sino-U.S. Joint Commission on Commerce and Trade, the two countries have held three meetings in Beijing and Washington respectively with the first meeting being held in 1983, the second in 1984, and the third in 1985. The responsibilities of the Sino-U.S. Joint Commission on Commerce and Trade are to examine and discuss bilateral economic cooperation, investment, technological transfer, and the situation of bilateral trade development; look for measures and steps to eliminate the obstacles; and continuously promote the smooth development of bilateral economic and trade relations.

Since 1972, when Nixon visited China and the two countries signed the Shanghai communique, Sino-U.S. economic and trade relations have been developing very fast. By the end of 1985, the total amount of direct U.S. investment in China exceeded U.S. $2.1 billion and the number of Sino-U.S. joint ventures already approved had reached 130.

According to the customs statistics, in 1985, the Sino-U.S. import and export volume reached U.S. $7.3 billion, hitting an all-time high. The volume of China's imports from the United States was U.S. $5 billion, in which the proportion of mechanical, electric, and instrumental products accounted for nearly 40 percent; the volume of China's exports to the United States was U.S. $2.3 billion, which was equivalent to that of 1984. The various economic and trade agreements signed and the various joint commissions established between the U.S and Chinese Governments stand in the forefront both in number and in scope among all the countries that have economic and trade relations with China. The United States has become China's third biggest trade partner. From 1979 to 1985, the bilateral trade volume between the United States and China accumulated to U.S. $35.3 billion. Great changes have also taken place in the bilateral import and export trade structure. China's imports from the United States have shifted from farm products and raw materials to mechanical, electric, and instrumental products and some other technological products. From a long-term point of view, there is great potential in the Sino-U.S. bilateral trade. In the economic and trade cooperation projects now under discussion between the two sides, there are many important industrial projects, including sea oil, coal mine, hydropower, telecommunications, aviation, the extraction and utilization of non-ferrous metals, and so on.

However, attention should be paid to the rise of protectionism in the U.S. Congress regarding Sino-U.S. trade. This treatens the expansion of China's exports to the United States. China is carrying out the policy of opening up and has adopted a series of measures to encourage Sino-foreign economic and technological cooperation and investment cooperation so as to have provided good conditions for the development of the Sino-U.S. economic and trade relations. However, the scope and volume of the bilateral trade will also depend on whether China's exports to the United States can steadily increase or not.

HUNAN CEMENTS TRADE TIES WITH COLORADO

HK240338 Beijing CHINA DAILY in English 24 May 86 p 2

[Article by correspondent Rosie Wu]

[Text] New York--At a high-tech conference held this week in Denver, Colorado, three Chinese entities are present. One delegation is from Colorado's sister province Hunan, while the other two are from the Ministry of Astronautics and the Huaxiang Industry Corporation based in Changsha.

The Chinese will visit high-tech companies and installations in the state and examine the possibility of expanding business, state officials said.

Two weeks ago, a conference on trade and investment opportunities in China was held in Denver, sponsored by the state. Business executives from 150 companies attended the conference and listened to a speech given by Chinese Ambassador Han Xu.

In June, the governor of Hunan, Colorado's sister province for the past three years, will pay a visit to Colorado, exploring ways to further develop business and cultural relationships between the two.

In September, Colorado School of Mines and six Colorado companies will participate in the Mining China '86 Trade Show to be held in Beijing. They will exhibit surface and subsurface mining equipment for coal and hard rock minerals, and electrical, communications, medical and transport equipment for mine operations.

A state of 3 million people, Colorado has a group of very active businessmen and state officials committed to the long-term relationship with China, Lieutenant Governor Nancy Dick declared.

Dick has just returned from her fifth visit to China. Three years ago, she signed the Colorado-Hunan Sister State Agreement following a successful industrial conference between the province and the state. Last September, she headed a large trade delegation from Colorado, touring Beijing, Shanghai, Changsha and Guangzhou.

CLANDESTINE RADIO SAYS YAO TRIP FAILS TO SOLVE PROBLEMS

OW260410 (Clandestine) Ba-Yi Radio in Mandarin to China 1215 GMT 24 May 86

[Text] During his negotiations in the United States, Vice Premier Yao Yilin failed to solve problems, including China's huge trade deficit with the United States. As pointed out by Comrade Yao Yilin, China's trade deficit has already exceeded $15 billion since 1972, and is growing. The imbalance has been caused primarily by the unfair situation in Sino-U.S. trade.

As is known by all, China bought from the United States large numbers of combine harvesters, much mining and oil refinery equipment, civilian aircraft, locomotives, motor vehicles, special instruments for scientific research, and computers. These goods were sold to us at high prices, which have continued to rise. At the same time, we exported to the United States petroleum, petrochemical products, textile goods, garments, toys, sporting goods, tableware, vegetables, and fruits. The prices of these products are relatively low on the international market; the prices of petroleum and petrochemical products especially have dropped continuously. Moreover, the Americans recently scrapped a previously signed agreement in an effort to renew the restrictions on Chinese textile and garment exporters to the United States. The low prices of our exports and restrictions on them will inevitably lead to a continuous increase in our trade deficits with the United States. According to estimates, China's trade deficits with the United States will increase by $1 billion this year.

During his negotiations, Comrade Yao Yilin asked the U.S. side to give a fair price for Chinese commodities. But the Americans avoided a settlement of this problem, which has a serious impact on China. Here, it is necessary to mention the trade between the United States and the Kuomintang authorities. Currently Taiwan ranks sixth and enjoys a favorable balance in U.S. foreign trade. It has a trade surplus of $10 billion. Obviously the United States is pursuing a two-China policy in its trade with us and Taiwan.

Another longstanding problem in Sino-U.S. trade is the United States' downright refusal to sell us sophisticated technology and equipment. Fearing that we will be able to manufacture such advanced machines and equipment by ourselves, the Americans have refused to supply us even with spare parts for the machinery and equipment we bought. Needless to say, they want to make us rely on their finished products and spare parts for the next few years so that they can control the prices and reap more profits for a long time to come.

In short, the outcome of Vice Premier Yao Yilin's negotiations in the United States has once again proven that the U.S. imperialists have no intention whatsoever to establish equal and mutually beneficial trade relations with us. They have always put their selfish gains above anything else and done everything possible to exploit the people of other countries.

BRIEFS

SICHUAN-HONG KONG COOPERATION--Hong Kong, 23 Apr (XINHUA)--Shu Hui [5771 6540] Industrial Company, an enterprise mainly devoted to developing and producing microwave communications technology and equipment, opened for business in Hong Kong on 22 April. It was jointly established by Xin Guang Industrial Import and Export Company from Sichuan Province and Hou Tian (International) Company of Honk Kong. The purpose of the establishment of the company is to absorb foreign capital and import advanced equipment in order to speed up development and production of mcirowave communications equipment suitable for use in China's rural areas. The company will also be used as a showcase to increase the export of commercial products made by military industrial enterprises in Sichuan Province. [Summary] [Beijing XINHUA Domestic Service in Chinese 1426 GMT 22 April 86 OW] /12640

XINJIANG INTERNATIONAL TRADE LINKS--Urumqi, May 28 (XINHUA)--Xinjinag Uygur Autonomous Region plans to expand its trade with the Soviet Union and Eastern Europe during the 1986-1990 period, deputies to the region's ongoing people's congress have decided. During the period, Xinjiang will also try to develop trade with West Asian, Arabian and Southeast Asian countries while increasing commerce with Japan, the United States, Western Europe, Hong Kong and Macao. Located in northwest China, the region borders on Afghanistan, India, Mongolia, Pakistan, and the Soviet Union. According to local officials, Xinjiang has established trade relations with more than 50 countries and regions. Between 1981 and 1985, its foreign trade totaled 814 million yuan, a ninefold increase over the previous five years. According to the region's development plan, Xinjiang's foreign trade volume in 1990 will reach 500 million U.S. dollars, a 60 percent increase over 1985. For this year, it plans to increase its trade volume to 323 million U.S. dollars, up 10.6 from last year. Major exports include carpets and raw cotton and cotton yarn and cloth. A railroad under construction in Xinjiang will be linked with the Soviet Union by 1990 and work upgrading the road to Pakistan has been accelerated. [Text] [Beijing XINHUA in English 1525 GMT 28 May 86 OW] /6662

BUSINESS WITH KUWAIT, TUNISIA--Beijing, May 28 (XINHUA)--China, Kuwait and Tunisia are to set up the China-Arab Chemical Fertilizers Company (SACF) in the port city of Qinhuangdao in Hebei Province. State Councillor Zhang Jingfu met today entrepreneurs from the three countries, who attended the SACF's second board meeting of 1986 held in Qinhuangdao May 26. Zhang wished them success in their cooperative efforts and hoped that the company would be a good example for South-South cooperation. Among those attending the meeting were Al Nouri, chairman and managing director of the Petrol Chemicals Industry of Kuwait, and B. Aouni, chairman and president of the company of phosphoric acid and fertilizer. [Text] [Beijing XINHUA in English 1409 GMT 28 May 86 OW] /6662

SPECIAL ECONOMIC ZONES

SEZ ENTERPRISES FORGE AHEAD IN TECH TRANSFER, ABSORPTION

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 1 Feb 86 p 1

[By correspondents Ji Honggeng [6060 3126 6342] and Huang Jichang [7806 7139 2490]: "The Special Economic Zones [SEZs] Unswervingly Develop Outward-Oriented Economies; They Have Started Large Numbers of Small-Scale, Light-Industry, Astute New Enterprises, Energetically Engaging in Joint Investments With Other Domestic Departments and in Imports From Abroad"]

[Text] The four SEZs in China valiantly exert themselves in the arduous struggle along the road of developing their outward-oriented economies, a field in which several advanced enterprises are now groping their way along, testingly, and are already reaping their first results.

The operation of "small-scale, light-industry, astute, new" enterprises. The idea of several units which newly established themselves at Shenzhen is to set up small-scale, light-industry, astute new enterprises.Some factories have only a score of or 100 to 200 employees. The Shenzhen Joint Company of the China Abrasive Wheel Factory No 2 is such a "little sparrow," which is laying "golden eggs" after only 1 year in existence. Its annual production is 1.5 million high-speed cutting wheels and "cymbal-shaped" abrasive wheels, which enjoy a good reputation overseas. The Hansheng Special Wire Corporation in the Zhuhai SEZ also can offer several specialties: they are "new," because they are technologically new and new as regards some of their items of production, all manufactured with advanced equipment. The quality of their "Panda" brand 75-ohm special feeder cables for television sets is superior to products from neighboring countries. It is a "small-scale" enterprise because it employs only 40 persons, had to spend only $26,000 for the importation of its equipment and required only half a year from its planning stage to actual production. It is an "astute" enterprise because it relied only on its own ability to absorb its imported equipment and technology, and was successful in its first test production and in introducing its products into the international market. Among the 45 industrial enterprises which up to the beginning of this year went into production in the Shantou SEZ, the larger ones are employing somewhat over 100 persons, the smaller ones only 40 to 50 persons.

Economic cooperation with the other departments and enterprises in the hinterland and importation from abroad; increasing values and exporting of goods. Enterprises that have been successful have become so by concentrating their efforts on combining economic cooperation with other departments and enterprises in the hinterland with their importations from abroad. One economic entity at Shenzhen, the Hualian Textile Corporation ("Huasi"), showed an integration of industry with trade, as it was organized by the Ministry of Textile Industry and the China International Trust and Investment Corporation, with joint investments from the textile departments of 18 provinces and municipalities. This company has built, or is in the process of building, 14 plants for spinning and weaving, printing and dyeing, knitting and for the manufacture of garments, primarily using semifinished and primary products of the interior, improving them by quality processing and quality packaging in Shenzhen, i.e. "dressing them up," and then marketing the products in the international market. The No 1 Cotton Mill of the company uses a most advanced air-current yarn production line, which increased work efficiency 4-fold; all its products are exported and it enjoys an excellent reputation overseas. They also imported advanced technologies and equipment from abroad for printing and dyeing and are processing the unfinished silk supplied from Zhejiang by printing and turning the material into multicolored silks, some being made up into garments, and the entire production being exported. According to revised calculations, the processing of the unfinished silk by printing and dyeing and turning the silk into multicolored material can increase the value of the goods by more than 40 percent; working the material into garments can increase the value by 120 to 150 percent. Overseas customers warmly welcome these products. The Marine Products Development Co. of Shantou not only engages in aquatic breeding but also more and more in intensive processing, refrigerating, etc. They imported a fully automatic production line for barbecued eel, which on going into production can annually create 4.8 million yuan of foreign exchange.

Harmonious combination of Chinese and Western elements in pursuing practical and realistic projects. Some enterprises in the SEZs lay particular emphasis on using the most modern technologies in the manufacture of new products. Other enterprises prefer the use of advanced technologies and equipment to develop traditional industrial products. Others, again, concentrate their efforts on developing from lower to higher levels of production with a harmonious combination of Chinese and Western elements. The Huasheng Magnetic Tape Factory of Wanzhai in the Zhuhai area is a township enterprise, which 3 years ago employed only 6 persons, had a factory of 16 square meters and only simple and crude equipment. Its annual production had a value of not quite 200,000 yuan. In recent years, they made good use of information from the international market, employed their retainable foreign exchange and a bank loan to import advanced equipment from Japan, the United States, Italy and other countries to build up a complete production line for plastics injection molding, coating, tape cutting, assembly, multiple recording and right down to tape testing. In cooperation with Chinese scientific research units, they developed a testing tape of the HCD box type and two other items, which are selling well domestically and abroad. By now the said factory has built a 5,000 square meter industrial building of seven stories. The value of its annual production is in excess of 30 million yuan, with over 2 million yuan annual profits and creating more than 10 million Hong Kong dollars in foreign exchange. People in the neighborhood are apt to boast: "The little worm of Wanzhai has grown into a large dragon with power to overturn rivers and stir up the sea!"

"Only by going in for an outward-oriented economy can there be vitality in the SEZ." This is what many highly placed persons in the business community say. As to the 29 enterprises under the "China Aviation Industry and Trade Center," set up at Shenzhen by the Ministry of Aeronautics, 80 percent of their last year's production was exported for sale abroad. They paid several million yuan tax during the first three quarters of last year. In the Shekou industrial district, the value of industrial products exported annually over the last 3 years was more than half of the total value of industrial products exported from the entire SEZ, reaching 75 percent last year. By now more than 100 industrial products manufactured at Shekou have entered the international market, and Shekou has had a surplus in its foreign exchange balance consecutively during the last 3 years. The accomplishments of the Shekou industrial district reveal the splendid prospects for the development of any "outward-oriented" economy.

RENMIN RIBAO SEES GOOD RESULTS AT SHANTOU SEZ

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 25 Feb 86 p 3

[By correspondents Yang Zhicui [2799 0037 3862], Sun Guolin [1327 0948 3829], Wang Ruizhong [3769 3843 1813] and Zheng Ruiguo [6774 3843 0948]: "Open Up One Sector, Build Up One Sector, Put One Sector Into Operation, Reap Profits From That Sector; Good Results at the Shantou Special Economic Zone [SEZ] As It Pushes Developments to the Utmost of Its Abilities; Major Portion of Light Industry and Agricultural Products Sold in the International Market"]

[Text] The Shantou SEZ in Guangdong Province persists in doing its utmost on the principle of opening up one sector, building up one sector, putting one sector into production and reaping profits from that sector; it does very solid constructive work, and the results are very good.

During the more than 4 years of its development, the Shantou SEZ derived most of its capital from foreign investments, its production was mainly industrial and agricultural and most of its products were destined for export. It took the initial steps to develop an outward-oriented economy. The products of its light industry, such as plastic products, garments, electronic toys, carpets, furniture, imitation antique ceramics and imitation jewelry, are to 60 percent being sold in the international market. Agricultural products, such as eel fingerlings, full-grown eels, snake products, wild animals, vegetables, fruits, prawns and green crabs are to 96 percent being exported. The total value realized by the SEZ last year from its industry and agriculture was more than 4 times the amount for 1984. These products created over $40 million in foreign exchange, 10 times the amount for 1984.

In its negotiations with foreign businessmen, the Shantou SEZ made it a major condition for acceptability of the projects whether the products can be exported and whether a foreign exchange balance can be achieved. Up to the end of January this year, contracts have been signed and industrial and commercial registration has been effected for a total of 248 enterprises, representing an investment of over 1.99 billion Hong Kong dollars. Of these enterprises, 61 were Chinese-foreign joint ventures, joint management enterprises and foreign- financed enterprises, with a total investment of $540 million Hong Kong dollars.The more than 10 factories that had been set up as the first lot in the Longhu industrial district, such as the Fensheng, Huayi carpet and other factories, are all foreign- financed or Chinese-foreign joint ventures. The first lot of agricultural projects are aquatic breeding farms developed jointly with foreign businessmen. The first lot of commercial and tourist network outlets are the Longhu Market, the Longhu Hotel and other such projects developed as Chinese-foreign joint venture or cooperatively managed enterprises. Much foreign investment also went into communications, transportation, real estate and other such undertakings. In 1984 the Baolong Co. of Hong Kong established the self-financed "Jinlong Weaving, Dyeing and Garment Co., Ltd." in the SEZ, which achieved good profits. The said company then again cooperated with the SEZ in 1985 in setting up the joint "Huabao Garment Co." venture on an even larger scale than "Jinlong," importing a whole production line for the manufacture of foreign clothes, which are being sold as far away as Europe and the United States. The area occupied by toy factories solely financed by Hong Kong businessmen has expanded from the original 1,000 square meters to 3,000 square meters. Demand exceeds supply of new products from the Zhengda Kangdi Feed Processing Plant, set up with investments from Thailand and the United States; this plant too is considering an expansion of its production.

For several years, the SEZ has invested 70 percent of its limited capital funds into items of the infrastructure with developmental and production potential, such as energy sources, transport facilities and communications and built up successively a special transformer station of 110 kilovolt- ampere, a special wharf for 3,000-ton vessels, and purchased three small-scale cargo vessels and one luxury passenger boat. Also completed is Shantou's 1,500-line telephone link with Hong Kong. By far most of the completed engineering projects, or those in the process of construction, are buildings to house industrial factories, and a small portion are installations for the livelihood of the people, such as residential buildings.

This year, the Shantou SEZ will continue to devote efforts to the building and expansion of items of the infrastructure, while at the same time making development of industry its key concern, actively importing foreign capital and expanding its capacity to export and create foreign exchange. Items of this year's capital construction are: development of its 0.2 square kilometer wide third subdivision; construction of the main thoroughfare of the SEZ, the 8kilometer long third section of Jinsha East Road; continued construction of 3 general factory buildings and the new construction of 4 plants for the processing of agricultural and sideline products; the building up of a financial and commercial district with such buildings as a commodity building of 12 stories, a commodity purchasing center of 16 stories, a market of 6 stories and a finance and banking building; construction of a feed processing plant with an annual capacity of 2,500 tons, and construction of a rare-earth processing plant.

SHEKOU INDUSTRIAL ZONE SUFFERS ECONOMIC SETBACK

HK060723 Hong Kong SOUTH CHINA MORNING POST (**BUSINESS NEWS supplement**) in English 6 May 86 p 1

[By Olivia Sin]

[Text] Shekou Industrial Zone suffered a setback in the pace of foreign investment in the first quarter of this year, partly because of China's measures to tighten control over its economy.

A vice-chairman of Shekou's administrative committee, Wang Jingui, said the zone had sealed fewer than 10 agreements with businessmen in the first three months, only half the number in the same period last year.

But he said the slowing down of development may have provided a welcome breathing-space for Shekou, which has undergone hectic expansion over the past five years.

The 10 sq km zone, to the west of Shenzhen, is being developed by state-owned China Merchants Steam Navigation Co (CMSN), a commercial arm of the Ministry of Communications.

Mr Wang said Beijing's recent squeeze on credits has rendered it more difficult to obtain funding for new projects.

Worse still, China's new export controls have prolonged the approval procedures for setting up export-oriented industries in Shekou.

In a bid to curb parallel trading, China expanded its export control scheme to cover 235 items in February.

That means foreign investors setting up factories in China to produce goods for export are also required to apply for licenses.

It used to take about a month to obtain approval for new projects; it now can take as much as six months, Mr Wang said.

The fact Beijing has called for a break on capital investment throughout the country has also slowed the development of Shekou's infrastructure and the pace of foreign investment.

Mr Wang disclosed the turn of events at a reception in Hong Kong yesterday to attract foreign interest in the industrial zone.

Scores of diplomats and Hong Kong Government officials were invited to the event, which included the showing of a 30-minute film depicting Shekou's development.

Mr Wang also admitted that the slide in oil prices and fall-off in drilling activities in the South China Sea had adversely affected Shekou, a logistics base for China's offshore oil programme.

The luxury Nanhai Hotel in Shekou, built to capitalise on the oil activities, has reported only 30 to 40 percent occupancy on weekdays.

Tourists visiting the zone during the weekend have helped fill up the hotel, a joint venture involving Hong Kong and Shanghai Bank, [word indistinct] and the Miramar Hotel.

"We believe that the number of oilmen staying in Shekou will increase after the typhoon season," said Mr Wang. Oil companies normally suspended operations during the typhoon months to avoid accidents.

The suspension may be longer this year than last, however, because the falling oil price has forced operators to either trim or postpone exploration plans.

Up to the end of last year, Shekou had concluded 206 agreements with foreign investors, worth a total of HK$2.6 billion.

About half of these agreements were for industrial projects, including manufacture of electronics, furniture, toys and aluminium plate. The rest were related to commerce, tourism and other service industries.

Mr Wang said 150 projects, including industrial ones, had so far started operation in the zone.

He said Shekou's total industrial output reached 800 million yuan (about HK$2 billion) last year, of which 70 percent was destined for export.

Analysts attending yesterday's reception were sceptical, however. "I think the 800 million yuan figure is a bit too much for Shekou in view of its emphasis on light industries and its comparatively low technical skill," one said.

Mr Wang said that like the Shenzhen Special Economic Zone, Shekou had received support from various industrial ministries, some of which have decided to invest in Shekou.

The zone is close to the port facilities in Chiwan and Wuwan, both of which can accommodate vessels of between 10,000 and 20,000 tons.

About 300 million yuan is to be devoted to capital investment this year--an amount similar to last year's level.

WAGE DISSATISFACTION CREATES ADMINISTRATIVE PRESSURES

Shanghai SHIJIE JINGJI DAOBAO [WORLD ECONOMIC HERALD] in Chinese 24 Mar 86 p 14

[Article by Huang Jian [7806 0256]: "Measures Must Be Taken To Resist Wage Pressure"]

[Text] Starting with the revival of the bonus system, enterprises have been tackling wage reform for 7 or 8 years. By 1985, 10 million workers in state-owned enterprises were governed by a system tying wages to economic efficiency. The system is almost universally praised. Meanwhile, a mood of dissatisfaction with wages is also spreading and gaining momentum, gradually forming a form of social pressure that cannot be underestimated. This dissatisfaction is largely responsible for driving up wages and consumption funds.

As an expression of social expectation, wage dissatisfaction is not hard to understand. But it becomes an abnormality or a disease if it does not fall in line with gains in national income and productivity and exceeds the amount of goods and materials social productive forces and finite resources can produce. According to relevant data, total wages in China shot up 20 percent annually in 1984-85, while national income, labor productivity and agricultural and light industrial output value, which represents consumer goods production, averaged 11, 8 and 12 percent, respectively. This shows that wage increases have been overly rapid in the last couple of years and must be checked. Paradoxically, despite the large sums of money which have been paid out in wages and the substantial improvement in living standard, people are becoming more and more unhappy with what they earn. They feel that they are now working harder but getting less and that the government has given them a raw deal. Even more serious, this dissatisfaction is putting immense pressure on wages and has become both a source and a psychological basis for wage inflation, vastly complicating the effort to hold down consumption funds.

Wage dissatisfaction is caused by many reasons, most important of which is that some people have fared much better than others under the distribution system. First, there is distribution inequity among individual members of society. It is true that among people who now earn significantly more than others are some very hardworking individuals who over-fulfill quotas and are therefore paid extra. But there are also those who enrich themselves not through diligence but by taking advantage of preferential policies of the state and exploiting the loopholes created by the two kinds of prices. Yet others break the law, violate discipline and "turn reform into a windfall" for themselves: they engage in speculation and profiteering, go into business by abusing their official position and set up front companies. Second, there is distribution inequity among enterprises. Some industries or enterprises offer relatively high wages not solely because they are profitable but because they have been favored by a certain policy. For instance, enterprises selected to experiment with the system of pegging wages to profits and taxes pay their workers about 15 yuan more each person each month than other units.

Distribution inequity is a temporary phenomenon in the course of reform. Basically speaking, our aim is to establish and perfect distribution according to work. However, our occasional failure to adjust certain policies promptly has given rise to this misconception in the public mind, that the present situation is our reform goal and is what we intend to do in future. As a result, people have become bewildered and disaffected. Clearly this trend of disaffection is highly dangerous.

First and mostly directly affected by the mood of wage discontent were enterprises. Ultimately it was also enterprises which opened the floodgate of wage increase. Under the old economic system, wage levels were set by a rigid command planning system. Worker dissatisfaction with wages was stifled through a lack of communications channels. Nowadays, however, enterprises have become more autonomous in the use of funds. For instance, after paying taxes, they are allowed to take a percentage of profits and it is within their power to divert various funds toward the pool of money for bonuses. Their power to sell part of the products on their own makes it possible for them to jack up prices arbitrarily, to profiteer and to give out bonuses at random. The establishment of labor service companies and joint urban-rural ventures also enables state-owned enterprises to channel funds and profits into collective units for distribution as bonuses.

Under the old economic system, administrative control by local governments and departments constituted another hurdle to wage increase. But local governments and departments these days take an attitude of sympathy, understanding and tacit approval toward the wage malcontents, faced as they are with wage pressures and anxious to mobilize production initiative, show off their results and obtain more support from their subordinates.

Taking into account a variety of factors, the state has yielded to the powerful wage pressures converging from across the country and been forced to take a number of irregular temporary actions such as recognizing unreasonable faits accomplis, raising the starting point for bonus tax and adjusting the wage base. At a time when many distribution relations have not been straightened out, these temporary measures have further fanned the flames of wage dissatisfaction. As enterprises, regions and sectors each try to keep up with the others, wages spiral and a vicious circle of wage dissatisfaction-wage pressure-wage inflation came into being.

It is not only necessary but also possible to steer the social feeling of wage discontent into constructive channels. Under socialism, labor is the only way to satisfy consumption. Basically, wage dissatisfaction can be resolved through production development and a policy that enables all of us to [illegible] rich together. Under socialism, which follows the principle--from each according to his ability, to each according to his work, the more you do, the more you earn, the less you do, the less you earn and he who does not work shall not eat. This way people's desire for higher wages and consumption are closely integrated with labor and the concept of the wage is transformed into one of labor, thus stimulating the development of productive forces and satisfying man's ever-rising material and spiritual needs. What results is a mechanism whereby production and consumption regulate and promote each other. This is one of the basic goals of the restructuring of China's economic system.

At present, we must first ameliorate the most glaring conflicts and sort out distribution relations. We should take these major measures: 1) Levy a personal income tax on industrial and commercial households with excessively high incomes. At the same time we must make plans for the collection of property tax and inheritance tax to close the gaps between individual members of society. 2) Carry out in a small number of enterprises a pilot project tying wages to economic efficiency. The project should be implemented systematically and in a targeted way. Further efforts should be made to perfect evaluation criteria, adjust the coefficient at which wages and efficiency are related to each other and rectify inter-industry and inter-enterprise income disparities resulting from different external conditions and unequal opportunities. 3) Within an enterprise, the size of authorized personnel must be clearly established and wage distribution must be put on a more scientific basis by evaluating labor in strict accordance with technical ranking.

Apart from gradually putting together a regular promotion and wage adjustment system, enterprises must make full use of bonuses.

Second, the scope of control must be expanded and administrative management strengthened. Among the most important steps are these: 1) Even as we continue to curb basic wage increases as planned, we must intensify control on bonuses, especially assorted subsidies, allowances and welfare payments. A sound tax system should be worked out for the extra-budgetary income of scientific research units, social organizations, newly built tertiary industries and products sold by the enterprises themselves. Loopholes in the books must be plugged to remove the temptation to wrongdoing. 2) Wage management must be tightened. A strict distinction must be made between basic wages and floating wages, on the one hand, and bonuses, on the other. The former must be paid monthly, while the latter must be controlled in advance instead of demanding an accounting after the event. The percentage of profits that an enterprise is allowed to keep after taxes must be strictly controlled. Special funds must be used for the specified purposes. 3) Wage management should be made a crucial part of the evaluation of the performance of managers and directors at all levels. It should also be related to their economic results. In addition, comprehensive measures must be stepped up.

TRANSPORTATION

NORTHEAST INTEGRATED TRANSPORT NETWORK ENVISAGED

OW040748 Beijing XINHUA in English 0721 GMT 4 May 86

[Text] Shenyang, 3 April (XINHUA)--An integrated land, water and air transport network with state-owned railways as the backbone will be developed in northeast China by the turn of the century, an official in charge of local transport said here today.

In an interview with XINHUA, Wang You said the construction of the network will serve the northeast China economic zone, the setting up of which was approved by the central government in 1985.

Covering Liaoning, Jilin and Heilongjiang Provinces and the eastern part of the Inner Mongolia Autonomous Region, the zone produces half of China's petroleum, iron, steel and timber, and a considerable amount of its coal, nonferrous metals, soda ash, automobiles and grain.

To accelerate the network construction, he said, provinces are encouraged to join the state in running transportation systems.

Liaoning and Jilin have purchased 13 freighters of 3,000 dwt each, and two railways being built by Heilongjiang and Liaoning will go into operation this year.

Three of the seven airports being renovated with joint investment from the local authorities and the civil aviation administration of China, have already gone into service. Heilongjiang has ordered three Tu-154 passenger planes from the Soviet Union for its planned aviation company.

In order to break down regional barriers, a company has been established to coordinate transport in the zone.

The railways have merged five administrations into two to facilitate train dispatch and management.

Trunk lines will be double-tracked and routes for coal transport renovated.

Short-distance cargo, estimated at eight million tons a year, is now transported by road instead of by rail, Wang You said.

In the meantime, a number of harbors are being built or renovated.

REPORTAGE ON GUANGDONG GOVERNORS REPORT TO PEOPLE'S CONGRESS

Reviews Transportation, Telecommunications Progress

HK240622 Guangzhou Guangdong Provincial Service in Mandarin 0900 GMT 22 May 86

[Text] In his report to the fifth session of the Sixth Provincial People's Congress, Governor Ye Xuanping said that during the Sixth 5-Year Plan period, the province made rapid progress in transportation and telecommunications so that a new situation has now appeared in the province's transportation and telecommunications.

Ye Xuanping said that during the Sixth 5-Year Plan period, the province completed railway transportation projects of 297.5 kilometers on the second Henyang-Guangzhou railway line, the Sanshui-Maomin railway line, and the second Guangzhou-Shenzhen railway line; built 2,348 kilometers of provincial grade highway; and built or revamped 490 permanent bridges, of which 45 are longer than 100 meters. Most major highways in the province have no ferry points and are open to traffic. Some 146,000 in-city telephones were installed in the province during the period. The Beijing-Wuhan-Guangzhou medium co-axis telecommunications cable and the eastern Guangdong-Western Guangdong-Hainan Island microwave telecommunications line have been put into operation. Some 36 counties and cities in the province now have direct telephone service with Hong Kong. The improvement the province made in telecommunications capability during the past 5 years exceeds that in the preceding 30 years. The province has initially established a telephone telecommunications service network with Guangzhou as its center and extended to major cities in the country and major cities and counties in the province and to Hong Kong, Macao, the United States, Japan, and other major international cities.

Assesses Seventh 5-Year Plan Growth

HK240311 Guangzhou Guangdong Provincial Service in Mandarin 0900 GMT 23 May 86

[Text] Governor Ye Xuanping pointed out in his report on the draft of the province's seventh 5-year plan that the province's industrial and agricultural output value is planned to rise at an annual rate of 9 percent during the period of the plan. This is a bit higher than the national average growth but lower than the province's sixth 5-year plan growth rate.

He said: In stipulating this growth rate, we are taking into account the necessity to create an excellent and relaxed environment for structural reform during the seventh 5-year plan and to avoid excessive tension in the economic relations. The province's economy should thus develop in proportion, with good economic results.

On the question of the scale and structure of investment, Ye Xuanping said that the province's capital construction during the seventh 5-year plan will show some increase compared with the sixth. However, it is necessary to readjust the investment structure. We must focus on ensuring electric power construction, and appropriately increase investment in communications, telecommunications, agriculture, science and technology, education, and the raw materials industries. Sources of investment for other projects should be solved through relying on a variety of channels such as the enterprises' own capital, local raising of funds, bank loans, and the use of foreign investment.

Stresses Continued Reform, Opening Up

HK240659 Guangzhou Guangdong Provincial Service in Mandarin 0300 GMT 24 May 86

[Text] Governor Ye Xuanping stressed in his report to the Provincial People's Congress session that Guangdong must continue to persevere in the policy of reform and opening up during the seventh 5-year plan. He said that the main aspects of reform during this period include further invigorating the enterprises, especially large and medium enterprises owned by the whole people and exporting enterprises; vigorously promoting lateral economic ties; establishing and perfecting a socialist commodity market setup; establishing a new socialist macroeconomic management system; and carrying out associated reforms in science, technology, and education while grasping economic structural reforms.

Ye Xuanping said: The main contents of the province's policy of opening up to the world include further improving the construction of the open coastal areas; expanding foreign economic relations, trade, and technological cooperation; actively and efficiently using foreign capital to import advanced technology; actively developing tourism; continuing to encourage overseas Chinese and Hong Kong and Macao compatriots to invest in the interior; and resolutely protecting the legitimate rights of overseas Chinese.

GUANGZHOU'S TRAFFIC JAMS: REASONS GIVEN, SOLUTIONS PROPOSED

Guangzhou GUANGZHOU YANJIU [GUANGZHOU STUDIES] in Chinese No 5, Sep-Oct 85 pp 17-18

[Article by Liu Yongjie [0491 3057 2638]: "Guangzhou Municipal Economic Research Institute: "What is the Crux of the Traffic Jam Problem?"]

Traffic jams have become more and more of a nuisance in downtown Guangzhou, and problems in traveling, in boarding public transportation and in finding a parking place have become increasingly difficult. Statistics show that between 1950 and 1984 the total length of city streets in Guangzhou increased from 288 kms to 400 kms, an increase of no more than 39.2 percent while the number of motor vehicles increased from 1,215 to 98,000 and the number of non-motorized vehicles rose from 32,000 to 1.5 million in an 81 fold and a 44.4 fold increase respectively. As a result of the increasingly sharp contradiction resulting from the lack of roads and the meteoric increase in the number of vehicles using them, traffic accidents increased. In 1984, there were 2,908 traffic accidents in downtown Guangzhou, a 23.1 percent increase over 1983, in which 1,399 people were hurt, 179 killed, and losses amounted to 1.8 million yuan. In addition, the economic losses resulting from traffic jams and the slow speed of vehicles has been startling. It has been estimated that the average speed of motorized vehicles in downtown Guangzhou has decreased from 20 kms per hour in 1965 to 12 kms per hour at the present time. Losses from this situation alone amount to the carrying capacity of 6,700 vehicles and losses of 200 million yuan per year. Clearly, solution to traffic jams has become an extremely pressing matter in the building of Guangzhou.

The urban traffic control problem is a multi-faceted issue involving many disciplines that has very wide ramifications. It is limited by many factors including the nature of the city, its function, population, geography and layout. These factors are interactive and overlapping, making urban traffic problems more intricate. Downtown Guangzhou is one of the areas in the country with the densest urban population. Nearly 2 million people live in only 54.4 square kms for a density of 40,000 per square km. Furthermore, downtown Guangzhou straddles both banks of the Zhu Jiang dividing the area into three areas: Hopak, Honam and Fongchuen. This constitutes an "inherent shortcoming" for a rational pattern of urban traffic and for channeling and controlling it. But, the main reason for the worsening of traffic in downtown Guangzhou remains "acquired dislocations," which is to say it is man made. This is manifested largely in three key problems: failure over a long period in investment, planning, and management.

1. Insufficient investment over a long period of time and improper proportional allocations are the root causes for the traffic jams in downtown Guangzhou. Transportation is the artery of a great urban system that functions to take in, send out and move along traffic. Experience in foreign countries has shown that the building of highly effective urban economies is inextricably related to highly effective urban transportation. Yet, for a long time, we have not genuinely understood this point; we have devoted attention to industrial production while overlooking development of basic urban facilities.

First of all, investment in urban construction has been curtailed for a long time. The total invested in state-owned capital construction in Guangzhou between 1950 and 1983 was 11.352 billion yuan, but 801 million yuan, or only 7 percent, was used for urban construction. This included the lowest percentage invested during the Fourth 5-year Plan at only 4.94 percent. The reason was that from 1967 forward, Guangzhou City no longer withheld 5 percent from the profits of industrial and business enterprises. As a result, urban construction funds declined from somewhat more than 40 million yuan per year to 20 million yuan per year leading to a severe shortage of funds for urban construction. The shortchanging of construction year after year made the burden increasingly heavier. Despite the revival in 1979 of 5 percent withholdings from the profits of industrial and business enterprises and an increase in expenditures by the city, because the amount of investment is too much in arrears, expenditures are a long way from being able to satisfy needs of urban development.

Second, the proportional allocations within investment in urban construction have not been correct. Investment in urban construction between 1950 and 1983 was 801 million yuan, including an investment of 139.9 million, or only 17.3 percent, in urban construction, for downtown streets and bridges. Investment in urban construction has increased in recent years, yet the investment in roads and bridges has still been no more than 20 million to 40 million yuan per year. In neighboring Hong Kong, meanwhile, investment in road construction during 1982 amounted to HK$1.3 billion (approximately 480 million renminbi). This comparison shows clearly how miniscule Guangzhou's investment inroads and bridges has been.

Neglect of the development of public transportation has also been another major manifestation of the proportional imbalance in investment in urban construction in Guangzhou. Since liberation, downtown Guangzhou's population has shown a net increase of more than 1.3 million and passenger volume carried by public transportation has increased from 3.6 million to 1.02 billion per year in a 28.3 fold increase. But public buses and streetcars in the city have increased only approximately eightfold. In 1984, 15 new public transportation vehicles were purchased, but more than 60 old and dilapidated vehicles were taken out of service. As a result of too small an investment in public transportation, carrying capacity declined dramatically. Today, public transportation in the urban area carries an average 2.5 to 2.6 million passengers daily, the number exceeding 3 million on holidays. It is becoming increasingly difficult to board public transportation, and this has stimulated, in turn, a blind increase in the number of bicycles which have added to the traffic burden on roads and brought about a vicious cycle.

Very clearly, at the heart of Guangzhou's traffic jams lies a failure of road construction to keep up with growth of the number of vehicles and the sudden spurt in traffic volume. Unless the percentage of investment is increased rapidly and construction of roads and traffic facilities accelerated, not only will it be impossible to reverse this situation, but traffic jams will ripple out from a part of the city to envelop the whole of it.

2. A mixture of people and vehicles cluttering the roads, numerous blockages along the streets, insufficient places to park vehicles and an irrational pattern of passenger transportation is the crux of Guangzhou's traffic jams.

Guangzhou`s city streets are a conglomeration of various kinds of transportation,all sorts of vehicles mingling as they go along at different speeds getting in each other's way. On many roads today, there are no facilities for keeping various kinds of vehicles separate from each other. All kinds of motorized vehicles and non-motorized vehicles go along the streets in a jumble. There are no places set aside to park bicycles, so they are parked on sidewalks everywhere, forcing pedestrians to walk in the streets and fight with vehicles for the right of way. This greatly reduces the traffic capacity of the roads exacerbating an already hectic traffic situation.

Many obstacles on roads is yet another problem that produces headaches. There are about 70,000 individual street peddlers and more than 10,000 unlicensed street peddlers throughout the city today who offer their wares for sale as they please along the streets. In addition, there are more than 3,000 motor vehicles stopped here and there along the streets, seriously obstructing traffic. It has been estimated that construction work, peddlers and stopped vehicles occupy 25 percent of the total road area of the city.

Deserving of even greater attention is the irrational pattern of passenger transportation in the downtown area. As was said earlier, because of the slow increase in public transportation, the number of individual transportation devices has surged. In June 1982, there were 1.22 million bicycles in the downtown area; by the end of 1983, there were 1.4 million. In 1 1/2 years, the number of bicycles in the downtown area increased by 180,000, an average of 500 per day being licensed. Bicycles have become the leading mode of passenger transportation in Guangzhou outnumbering public transportation 3 to 1 in a very irrational pattern of transportation. Measurements show that a moving bicycle takes approximately 9 square meters of road space, while a moving bus carrying approximately 75 people takes 100 square meters of road space or an average 1.3 square meters per passenger. A person riding a bicycle takes up 6.9 times as much space as a person riding a bus. During rush hour in downtown Guangzhou today, there are no fewer than 250,000 bicycles on the streets at the same time. At this rate, bicycles take up a 2.25 millions square meter area, which equals the road area that would be occupied by 22,500 buses. In Guangzhou today, however, there are only slightly more than 1,500 buses. Were the number of bicycles restricted and half of the area occupied by bicycles turned over to buses, the problem of traffic jams on the roads would be greatly improved. Viewed in long-range terms,then, bicycles are not the direection in which the city's transportation should develop; much less should bicycles become the mainstay of the passenger transportation system of a large city. They can serve only as an auxiliary mode of transportation.

3. Many alterations of city plans and a lack of a scientific layout have been major elements contributing to traffic jams in downtown Guangzhou that cannot be overlooked.

Cities are large complex systems in which people are the dominant element, snd they are characterized by the utilization of space and have as their goal the gathering of economic benefits. They react slowly to changes in parameters; they stubbornly resist policy changes; and pressures to alter balanced relationships are cumulative and pent up in nature. Since these are the features of cities, the building of cities must have a clear cut urban system objective. With this objective, it then becomes possible under guidance of an overall urban plan to make a rational layout and to improve the downtown street transportation network. But, during the past more than 30 years, Guangzhou has been buffeted by "political winds" as a result of which its building programs have undergone seven separate changes, and overall urban plans have been changed along with them a total of 13 times. This has artificially caused the direction of Guangzhou's development and the pattern of its urban planning to waver back and forth irregularly. Though there are many reasons for today's traffic jams, unpredictability about the city's construction program and about city planning plus failure to complete individual areas in a fully rational way are also major reasons that cannot be ignored. We have failed for a long time to give sufficient attention to the full completion of living facilities in close in suburban industrial areas. Only 32 percent of employees have made their homes where they are employed while 68 percent continue to live in the downtown area. This causes traffic jams in Guangzhou during the morning and evening rush hours. In the residential tracts built in recent years on the fringes of the city, likewise only houses have been built with very few shopping areas being built. Large and small commercial centers are still concentrated in the old urban area. Reportedly, plans call for the construction of a commercial area in Guangzhou on Beijing Road. As everyone knows, Beijing Road is located in the most bustling part of Guangzhou. It is one of the areas in the city with the greatest vehicle and pedestrian density where transportation in every sector is already filled to fullest capacity. But jammed into this commercial area is to be a "colossus" made of one 53 storey and two 35 storey buildings. How is the flow of the the stream of people attracted to this site and the large volume of motorized and non-motorized vehicles to be solved? This is a problem that cannot be ignored; full consideration must be given to it during the initial period when construction is being planned. Dispersal of transportation sources and dispersal of urban population to improve the urban environment is the inevitable direction of development of large cities in the world today, and naturally this also provides beneficial lessons to be drawn on to solve Guangzhou's transportation problems.

4. A chaotic management system and antiquated management skills are also major reasons causing traffic jams in the Guangzhou urban area.

The maladies currently afflicting the transportation management system in Guangzhou are: "decentralization of government authority, many units exercising authority without dovetailing or proper coordination, each one acting independently and getting in each other's way." "Old grannies" in charge of transportation are numerous. There is the Public Security Bureau, the Transportation Bureau, the Public Utilities Bureau, the Municipal Government Administration and the Planning Bureau, plus the Transportation Safety Commission, the Communications and Transportation Directorate, the Office for the Overall Guidance of Transportation, and the Office for the Reconstitution of the City's Appearance and Environmental Sanitation---a total of more than 10 units. Were each to carry out its duties and do what it thinks best, strict enforcement of orders and prohibitions would be difficult indeed; however, the present state of management cannot be said to be satisfactory. Consequently, the founding of a centralized modern planning organization with a high degree of authority will brook no delay. The chaotic transportation management system must inevitably lead to antiquated management of transportation. Current transportation regulations are incomplete with many clauses having been formulated in the 1960's; they are no longer in keeping with the new situations and new problems that have arisen.

To turn around the serious traffic jams in Guangzhou, future efforts must be directed toward simultaneous dispersal of the cause of the jams, construction and management. Forces from all quarters has to be mobilized and action taken through scientific study, the building of roads, management of transportation, propaganda and education and improvement of the legal system to bring about comprehensive control so that Guangzhou's transportation situation will fundamentally change for the better within a not too long period of time to bring about a new situation of smooth flow, safety, high efficiency and good order.

ELECTRIFICATION OF RAILROADS PROCEEDING IN SOUTHWEST

HK270709 Guiyang Guizhou Provincial Service in Mandarin 2200 GMT 23 May 86

[Excerpts] According to GUIYANG WANBAO, the electrification project of the Guiyang-Kunming, Hunan-Guizhou, and Sichuan-Guizhou railroads, listed as the country's priority project in the Seventh 5-Year Plan, is proceeding smoothly. The Guiyang-Kunming railroad is 639 km long.

By the end of 1985, the electrification of the 246 km of the section between Guizhou to Shuicheng (west) was completed. The electrification project of the 131.56 km between Shuicheng (west) and Fenghuangshan in the province is well under way. There are 14 stations in the project. Railroad track laying has been completed in 87 tunnels and earthwork has been completed in 6 stations so far. The electrification project of the section between Shuicheng (west) and Yunnan's Xuanwei is scheduled to be completed and put into service on 1 October 1987.

In the electrification project of the 902 km between Guiyang and Zhuzhou in the Hunan-Guizhou railroad, the section between Guiyang (south) and Kaili is about 170 km. There are 21 stations and 4 tractor substations in the section, of which 18 stations have completed technical transformation. The electrification project of the section between Guiyang and Kaili is scheduled to be completed on 1 July 1987.

In the electrification project of the 415 km between Guiyang and Chongqing of the Sichuan-Guizhou railroad, contractors have been decided for the section of the 292.6 kilometers between Guiyang and (Dongzhuhe). The No 2 railroad bureau will be responsible for the earthwork and [words indistinct] of the section between Guiyang and (Zaoshui). The bureau is now sending contractors to the site.

BRIEFS

HEILONGJIANG RIVER HARNESSED--Shenyang, 26 April (XINHUA)--The Heilongjiang River, one of the three-largest river systems in China, is playing an increasing role in solving the shortage of transport capacity in northeast China. During the Seventh 5-Year Plan which just started, the state will allocated 150 million yuan to improve river navigation in the region which produces abundant petroleum, timber, coal and grain, according to Zhao Dekui, deputy director of the River Navigation Administration, today. With nearly 2,000 tributaries, the river links Heilongjiang and Jilin Provinces, and the Inner Mongolia Autonomous Region. Nearly half of the 19,000 km system allows passage of ships of at least 500 dwt. Now all 158 harbors and landing berths, including three harbors each with an annual cargo-handling capacity of more than one million tons, in the river system have been improved, and all the navigation lights electrified. Some three million tons of cargo was shipped along the river last year, as against only 210,000 tons in the early 1950s. At present, nearly 100 individuals are operating transportation services on the river, alongside the state-run transportation companies. [Text] [Beijing XINHUA in English 0648 GMT 26 Apr 86] /12640

XINHUA: SOVIETS HOLD DISCUSSIONS ON ECONOMIC REFORM

OW300732 Beijing XINHUA in English 0705 GMT 30 Apr 86

["Round-up: Theoretical Discussions Explore Way for Soviet Economic Reforms (by correspondent Shen Yiming)"--XINHUA headline]

[Text] Moscow, April 30 (XINHUA)--Soviet theoreticians, holding reform-oriented discussions, believe that outmoded concepts must be discarded if the country's sluggish economy is to improve.

Observers say these discussions are proceeding in an "animated" way and in a seek-truth-from-facts approach. Most participants claim that the "dogmatism, stereotype and simplism" chains need to be shattered to pave the way for reforms.

The reforms are designed to speed up economic growth, which has been sluggish since the 1970's. Most planned targets set for the Soviet Union's last three five-year-plan periods covering 1971-1985 have not been met.

The corelation between productive forces and production relations is among the issues being discussed.

1. I. Abalkin, an economist, wrote in a recent article that production relations under socialist conditions will not hold forever and cannot be perfected through the development of productive forces. The decades-old theory, now dismissed as outmoded, maintains that production relations of socialist public ownership will be refined "spontaneously" as productive forces advance.

Production relations, Abalkin said, needed continuous perfecting--as demanded by the socialist economic law--to ensure the growth of productive forces.

Abalkin said that the "most profound cause" of the obviously negative phenomena emerging in the economy between the 1970's and the early 1980's was the contradiction between expanded productive forces and production relations, which have taken shape under the extensive management system.

Other people point out that the poor economic performance has been attributed solely to increasingly unfavorable conditions for acquiring raw materials, bad weather and flaws in planning. This fact, they say, serves as proof of the failure to recognize that production relations need continual refining, which is necessary for continued growth of productive forces.

More attention is being given to commodity-money relations, regarded as the antithesis of planning because commodities and money have been rejected as foundations for capitalist economies. Most Soviet economists believe that planning and commodity-money relations are inseparable. Only when planning is considered on the basis of that relationship can the economy become truly economic operations rather than administrative ones. The economists point to the need to make the entire system of commodity-money relationship function normally.

Most people insist that systematic formulation of prices and planned prices should have positive effects on consumption of social labor, lower production costs and improved production returns. How prices are determined should be through the consumption of social necessary labor.

The 27th Congress of the Soviet Communist Party held in late February and early March called for reviving the principles of the so-called "grain tax." This policy, introduced in the early 1920's, allows farmers to have grain surpluses at their disposal after they have sold obligatory products to the state. Economists say the policy can help invigorate the interflow of commodities between urban and rural areas and enhance farmers' enthusiasm for their work.

Economists also maintain that arguments saying the family and individual contract system is a non-socialist, backward management method should be repudiated. The contract system, they say, serves as a way of making workers' income levels directly dependent on work efficiency.

However, many reform skeptics harbor "more apprehensions than hopes." Some even say any change in the economic mechanism will mean a departure from socialist principles. But these theoretical probes may thrive behind the driving force of the Soviet leadership.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

KEY QUESTIONS ON GENERAL SURVEY OF INDUSTRY ANSWERED

Chengdu SICHUAN RIBAO in Chinese 25 Dec 85 p 2

[Interview with Responsible Person of Sichuan's Leading Industrial Inspection Team By Unnamed Reporter: Various Tasks in Completing the General Inspection in a Timely and High-Quality Manner, the Responsible Person of Sichuan's Leading Industrial Inspection Team Responds to Related Questions"; date and place not given]

[Text] The State Council has decided that during the first quarter of 1986 the second national general inspection of industry will be carried out. Recently, a reporter from this newspaper interviewed the responsible person of Sichuan's leading industrial inspection team. The following are his responses to the reporter's questions.

[Question] What is the purpose and significance of this general inspection of industry?

[Answer] This second national general inspection of industry will be a significant survey of the national condition and national power. It is an extremely important basis for the construction of socialist modernization. At the present time, China has entered into a new period of socialist construction. In order to formulate and carry out social and economic guiding principles, policies, and plans, we need to get a grasp on comprehensive and detailed data and economic information so we can have a clear understanding of the situation and make correct policy decisions. Doing a good job in this general inspection of industry will be extremely significant in ensuring we proceed from China's actual condition in drawing up long-term plans, promoting restructuring of the economic system, carrying out technology reform of enterprises in a planned and concentrated manner, raising the management levels of industry enterprises overall and improving the quality of enterprises, increasing the pace of industrial modernization, strengthening overall economic control, and in realizing the grand objectives formulated by the 12th CPC Congress.

[Question] What is the basic task for this general inspection of industry?

[Answer] This national inspection of industry, in general has two tasks: The first will be in looking at the overall economy find out the basic situation of China's industry through a general inspection. It will survey the national situation and national power, and supply basic industrial economic data to leading economic departments that is fairly comprehensive, detailed, and systematic. In addition to reporting on the overall picture of production, supply, sales, personnel, finances, and materials, it will also highlight four key points, namely, the internal structure of industry, the state of technology industrial equipment is in, the quality of workers, and economic results. The second task will be to look at the microeconomy, find out the basic situation of each industrial enterprise through the general inspection; to strengthen the statistical, recordkeeping, and economic accounting work of enterprises; survey the situation and power of factories; and on the basis of learning about resources, tap latent powers, renovate, transform, and establish sound economic responsibility systems within enterprises; and further improve the management level of enterprises.

[Question] What will the general inspection be targeted at and consist of?

[Answer] This general inspection of industry will be targeted at all enterprise, including state-owned independent accounting enterprises; collectively owned enterprises (township and enterprises); dependent accounting units, village-operated enterprises, and individual town and township enterprises; and joint enterprises with Chinese and foreign funds and cooperation, and foreign-founded enterprises. This inspection will consist of many things, including the basic conditions of enterprises, such as the production, marketing, and storage of industrial products; new products and product quality; production equipment and capacity of industry; technical and economic goals of industry; consumption of energy and raw materials; labor wages; finances; industrial product prices; development and utilization of mineral resources; and technical development of enterprises in industry. By carrying out scientific regulation and quantity determination for processing and qualitative analysis research based on these things, we can basically satisfy the needs of the state and the needs of various areas responsible departments for a complete picture of the industrial economy and of formulating principles, policies, and plans along with their needs concerning industrial enterprises organization, production, management, and administration.

[Question] How can this general inspection of industry be done in a timely and high-quality manner?

[Answer] This general inspection will be broad in scope, wide ranging, cover a lot of ground, and have some heavy requirements; it will be a project that has a fairly complicated system, a highly technical nature, and one which will be extremely difficult. Therefore, when carrying out this work, we ask that leaders at all levels and the departments concerned take the general inspection very seriously, that they raise awareness of the necessity and importance of the inspection. To ensure the inspection is conducted smoothly, they should earnestly strengthen organizational leadership, replenish the ranks of inspectors, and provide funds for the inspection. Second, they should firmly stress and guarantee the quality of the inspection. This requires that regions, departments, and enterprises do a concientious job of filling out and checking the survey forms, maintain overall control of the survey, and do a good job of scientificaly arranging and compiling the data from the survey. They are to seek truth from facts from beginning to end so the actual situation is reflected. They are also required to pay attention to the work of analytical research and calculations of the survey data. Third, leaders at all levels and of related departments are to work together, be closely coordinated, make good use of time, inspect all preparation work and bring work that does not meet requirements up to standard. This general survey should set up work responsibility systems at each level to guarantee the various tasks of the survey are completed in a timely and high-quality manner.

ECONOMIC MANAGEMENT

JOURNAL ON CONTROLLING SCALE OF INVESTMENT

HK290911 Beijing JINGJI GUANLI in Chinese No 4, 5 Apr 86 pp 18-21

[Article by Luo Jingfen [5012 4737 1164] and Hou Shuming [0186 2885 2494]: "Control the Scale and Adjust the Structure of Investment"--edited by Liu Jichang [0491 0366 2490]]

[Text] In the reform of the economic structure, due to the expansion of the financial power of the regions and enterprises and strengthening the position and role of the banks in the national economy, investments in fixed assets have shifted from the single channel of appropriations from the state budget in the past to many channels such as extra-budget bank loans, self-raised funds and so forth. In recent years, the scale of bank loans and self-raised funds has increased rather rapidly. In 1984, the total sum of fixed asset investments financed from these two sources was equivalent to 140 percent of the state-budgeted investments. The reason for the excessively large scale of the fixed asset investments in the fourth quarter of 1984 and the year 1985 was principally due to the too-rapid increase in bank loans and self-raised investment funds. From now on, following the further development of the reform of the economic structure, the proportion of bank loans and self-raised funds in the scale of fixed asset investments will be further enlarged. Hence, the key to strengthening the control of fixed asset investments lies in stepping up the control over outside-budget investments (principally bank loans and self-raised investment funds). Stepping up the control in this connection not only requires rigidly controlling the scale of investment and having the scale controlled within the state plan but also guides the direction of the investments, encourages more of the extra-budget funds to be invested in the "short-line" sectors such as energy, communications, raw materials and so forth, and restricts the blind development of certain processing industries. The strict control of the investment scale is not only urgent business to be done in the first 2 years of the seventh 5-year plan period but also constitutes a long-term task which cannot be relaxed at any time. However, if the structure of investment is irrational, then not only will the coordinated development of the national economy be impeded but control of the investment scale will also be difficult. This is because in the event of an excessive investment of extra-budget funds in the processing industries, extra pressure will be applied on the energy, communications and raw materials sectors, demanding more investments in the latter fields and thereby bringing about the further inflation of the whole investment scale. Therefore, at present, the key to controlling the scale of investments and ensuring and providing for reserve strength for the development of the economy lies in rationally adjusting the structure of investment.

In order to step up the control of extra-budget investments, first of all, it is necessary to strengthen planned management and strive to organize construction work within a rational construction period. Hence, it is important that we firmly liquidate, or put in order, the projects still in construction and rigidly control new projects. The funds, materials, and equipment needed by newly-rising large and medium-sized projects should first be arranged and ascertained before the inclusion of the projects in the construction plan and they must be supplied in full each year within a rational construction period. If this cannot be done, then the projects can only be considered as reserve projects. In addition to projects in the reserve list, it is also necessary to grasp a number of projects well and carry out pre-stage work on them. To ensure that the projects under construction are technologically advanced, economically rational, estimated correctly and with precision, and that the contracting is unquestionable to the very end, all new projects should be first subjected to assessment and examination by relevant advisory organs before their submission for approval to be included in the annual plan. Prior to a project formally starting construction, it must first present to the relevant department a report on starting construction work for approval.

For the purpose of stepping up the control of non-budgeted investments, we should also pay close attention to employing economic measures and put into full play the regulatory functions of economic levers.

I. A Firm Grasp of the Exact Degree of Looseness or Tightness of the Money Market Is an Important Economic Regulatory Measure in Stepping Up Macro-control Over the Scale of Loans

Up to the present, a situation of the scale of capital construction loans having increased too rapidly and of an excessive issuance of banknotes still exists. Hence, we should continue to appropriately tighten the money market and rigidly control the scale of loans.

It is necessary to grant loans in accordance with the state's credit and loan plan and capital construction plan. Under the state's capital construction plan, the projects arranged for loans are mostly the state's major construction projects in the sectors of energy, communications, and raw materials. These projects are all "short-line" projects which urgently await development but which have so far restricted and impeded the development of the national economy. On their part, the banks, taking into consideration the situation as a whole, should provide the loans to them according to the state plan. Prior to the prices having been generally put in order, the parties concerned may not have the ability to repay these loans promptly. Thus, in order to adjust the investment structure, banks should charge differential interest rates on their loans to different industries and trades. Lower interest rates should be charged on construction projects in the sectors of energy, communications, and raw materials, whereas higher interest rates should be charged on projects of processing industries whose development should be restricted. Alternatively, on loans for construction projects in the sectors of energy, communications, and raw materials, the finance departments or banks may have the interest so deducted, and in the event of the parties concerned being really unable to repay loans, appropriations may be made in lieu of loans.

We should sternly control non-budgeted loans. Granting of loans outside the state plan is an important cause for the excessively large scale of loans for fixed asset investments. Effective measures should be enforced to have it restricted. Regarding regional leadership circles at various levels who, taking into consideration only partial or local interests, have forced banks to grant non-budgeted loans, such practices should be dealt with in accordance with the stipulations of the "Regulations Covering Loan Agreements" promulgated in 1985 by the State Council. These regulations have definitely provided as follows: Organization units and individuals shall not compel banks to grant loans; otherwise, the administrative responsibility and economic responsibility of those directly responsible shall be investigated and affixed. In the case of serious offenses, criminal responsibility shall be investigated and affixed by the judicial organs. In the event of banks at grassroots level granting non-budgeted loans of their own accord, banks at the higher level shall be responsible for promptly reclaiming the loan funds and shall investigate and affix the administrative and economic responsibilities of the parties concerned. If the loan funds have already been used in full, it will be necessary for the amount of the loan quota in the succeeding year of the bank concerned to be correspondingly reduced. Fixed asset loans granted by trust departments of trust and investment companies and specialized banks generally belong to the category of non-budgeted loans. It is necessary that these trust organs be earnestly checked up and consolidated. Only after consolidation and upon being found to be in conformity with the necessary conditions, and also subject to approval by the People's Bank, shall these trust organs be allowed to grant fixed asset loans which are included in the state plan. Regarding cases in which bank loans are used on projects purported to be self-financed and cases in which loans for circulating funds are used to finance fixed asset investments, the banks are empowered to reclaim the loans; if the loans have already been partially used, then on such parts heavy fines shall be made or payment of double the interest rate shall be required. Since currently the interest rate on loans for circulating funds is on the low side, and for the sake of discouraging the enterprises from employing loans for circulating funds to finance fixed asset investments, we should consider appropriately raising the interest rate on loans for circulating funds and resorting to use of differential interest rates.

We should also improve the method of repayment of principal and interest payment on loans. The existing method is that after a project has been completed and put into operation, the before-tax profits are used to meet the principal and interest payments on the loans. This in effect amounts to the finance department taking up over 50 percent of the burden and the effects on the economic benefits of the enterprise are not large at all. It is suggested that in the case of state-owned enterprises principal repayment be made from the before-tax profits whereas interest payments be made from the enterprise's retained profits. Since at present a number of the enterprises are unable to take up this burden, the method should be tried out first among those enterprises which are in the processing industries and have more profit retentions. When and as in the future the profit retentions of the enterprises are increased, then a transition may be gradually made to the enterprises meeting the interest payments on loan projects in general from among their own profit retentions. This will directly link together interest payments with the enterprise's benefits and will force the enterprises to calculate more meticulously when applying for loans, and to highly regard the importance of economic benefits when making use of the loan funds. This will also perform the function of curtailing the application for loans for projects with rather poor economic benefits.

We should consider appropriately raising the rediscount rate of the Central Bank. At present, the interest rate charged by the Central Bank on rediscounting loans from the specialized banks is too low. The monthly rate is only 0.3 percent whereas the specialized banks charge the enterprises interest of 0.66 percent 3-year term loans, a monthly interest of 0.72 percent, 5-year term loans, a monthly interest of 0.78 percent, 10-year term loans, a monthly interest of 0.84 percent; and loans of over 10 years, a monthly interest of 0.9 percent. In practice, the repayment period on loans for technological transformation projects is usually 3 to 5 years, and that on loans for capital construction projects is over 5 years. If an average of 5 years is taken as the loan repayment period, the rediscount interest rate charged by the Central Bank on the specialized banks is equivalent to only 50 percent of the interest rate charged by specialized banks on 5-year fixed asset loans. This is also rather low when compared with the major capitalist countries in the Western world. In the latter countries, the ratio between the rediscount interest rate of the Central Bank and the interest rates charged by commercial banks on loans of favorable terms is as follows: U.S.A., 76.2 percent; Canada, 88.5 percent; Japan, 86.93 percent; England, 89.9 percent, France, 79.2 percent; and West Germany, 58.1 percent. If the rediscount interest rate of the Central Bank os too low, the specialized banks are discouraged from exerting efforts to obtain deposits but are encouraged to borrow money from the Central Bank, as the more such loans made the greater are the profits. In turn, this is disadvantageous to exercising control over loan-granting by the specialized banks (including the scale of loans for fixed asset investments). It can be seen that if we raise the rediscount interest rate to a level which makes the specialized banks reap only a small profit, or no profit at all, from borrowing money for the purpose of granting loans, then the scheme can play a definite role in controlling the scale of investment. After raising the interest rate on the Central Bank's rediscounted loans, we should follow up with appropriately raising the interest rate on deposits made by the specialized banks to the Central Bank (the current rate is a monthly interest rate of 0.36 percent), so as to attract the specialized banks to deposit more of their surplus funds with the Central Bank. As for the interest rate on the reserve funds for deposits prescribed by law, it should not be raised at all; on the contrary, it should be gradually lowered to the point of the deposits bearing no interest at all.

In order to control the scale of bank loans, in regard to capital construction loan projects, the construction unit concerned should possess self-retained funds amounting to 30 percent. Following completion of the project and its operation, 30 percent of the needed circulating funds should be made up of self-retained funds of the construction unit, so as to shift briskly from the existing practice of completely relying on bank loans to serve as circulating funds.

II. Stepping Up the Control and Guidance Over Funds Outside the State Budget and Making Investments With Self-raised Funds Maintain a Rational Scale

Funds outside the realm of the state budget constitute the main source of investments with self-raised funds. In recent years, with the expansion of the financial power of the regions, departments, and particularly the enterprises, funds lying outside the realm of the state budget have increased rapidly. Naturally, this is beneficial to arousing the enthusiasm of the regions, departments and enterprises for invigorating the economy and developing production and also beneficial to strengthening the capability of the enterprises themselves to undertake self-transformation and self-development. However, in the employment of this portion of funds, we should not adopt a lax policy, or allow it to follow its own course, or give up the control over it altogether. At the same time, it should not be controlled summarily, with each and every project being subjected to examination and approval. Rather, we should follow a smoothing-out guideline and accord it with correct guidance: 1) Guiding this portion of funds against being used excessively on investment in fixed assets and using and appropriate portion of the funds to increase and supplement the circulation funds of the enterprises; and 2) guiding the portion to be used on fixed asset investments to the track of technological transformation and capital construction in the sectors of energy, communications, and raw materials which are in short supply and restricting the blind development of certain processing industries.

Hence, it is necessary to adopt certain economic regulatory measures to ensure the meeting of the demands of the state plan.

In regard to enterprises engaged in the processing industries which command high prices, are highly profitable, and usually enjoy large after-tax profit retentions, their share in subscribing to the sinking funds for major construction in the energy and communications sectors should be further increased. In addition, energy and communications construction funds should be collected from the urban and rural collective enterprises, thereby appropriately increasing the state's major construction funds and restraining the blind expansion of the sources of funds which can enable the processing industries to raise their own investment funds.

We should also adequately raise the proportion of the enterprises' self-retained circulating funds. At present, the production development funds of the enterprises are basically used on fixed asset investments whereas nearly the whole of their circulating funds depends on bank loans. Thus, on the one hand, the scale of fixed asset investments is enlarged while, on the other hand, the scale of loans for circulating funds from the banks is likewise enlarged. To solve this problem, we should require those enterprises which manifest a low ratio of self-retained circulating funds to use a definite ratio (for example, not lower than 30 percent) of the production development funds to supplement their circulating funds. If an enterprise is found to have violated this ruling, the banks may refuse to grant any loans to it to serve as circulating funds. In the case of projects which the processing industries have newly established from their own self-raised investments, the circulating funds they need when starting operations should wholly be derived from their own self-retained funds. The banks will not grant any loans for these purposes. In addition, these funds, together with self-raised investment funds, should both be deposited with the banks in advance.

In 1985, the interest rates on bank deposits and on bank loans were raised on two separate occasions but the interest rate on fixed deposits of enterprises was not raised at all, although it was already on the low side (the monthly interest on 1-year fixed deposits was 0.3 percent). Compared with the residents' savings deposits (on 1-year term savings deposits monthly interest is 0.6 percent), and interest rates on loans (monthly interest on 1-year term fixed asset loans and monthly interest on circulating fund loans are both at 0.66 percent), the difference is very great and is disadvantageous to stirring up the enthusiasm of the enterprise units for making fixed deposits. Therefore, it is suggested that the interest rate on fixed deposits of the enterprises should be appropriately raised and that the grading of the interest rates be increased (in addition to existing long-term deposits, short-term deposits up to the period of 1 year may be added). This can encourage the enterprises to deposit with the banks their funds which they do not use for short durations within a year, thus enabling the state to make use of them in various directions and to meet the macroeconomic needs.

It is also suggested that various methods be adopted, such as joint investment by central departments with the localities or with the enterprises, issuance and floating of construction bonds, and so forth, to invest a portion of the funds that are outside the state budget in the construction of projects in the sectors of energy, communications, raw materials and so forth. Following the completion and putting into operation of the jointly-invested enterprises, the enterprises, on the one hand, can enjoy the profits earned in accordance with their investment ratio and, on the other hand, receive the benefits of distribution of the products made. Units and enterprises purchasing large amounts of construction bonds may also receive principal-repayment and interest-payment in return or, in accordance with their needs, be given the enterprises' products as compensation.

We must fully allow the construction tax to play the role of keeping the investment scale under control and to guide the direction of the investments. The current rate of the construction tax is uniformly fixed at 10 percent. This may play a certain role in restricting the scale of investment with self-raised funds, but its role in adjusting the structure of investment is not large at all. We suggest that the construction tax be raised appropriately and also suggest the institution of a differential tax rate. On renovation and transformation projects and on capital construction projects in the energy, communications and raw materials sectors, the existing construction tax rate should remain unchanged; as for construction projects in the processing industries, the tax rate should, following different conditions, be raised to 20 to 30 percent. To ensure the prompt and full collection of the construction tax, the existing method of collecting the tax after completion of the project should be changed to collecting the tax as soon as the investment plan has been approved, and the relevant departments should, only after viewing the tax receipts, proceed to examine, assess, and approve the commencement of construction work.

At present, there are many fund-raising projects which have paid out compensation in large amounts and have stimulated certain units and individuals to withdraw large amounts of funds from the banks and use bank loans to take further part in raising funds for projects, thus not only serving to expand the scale of investment but also increasing the consumption funds. For this reason, it is necessary to suitably control those projects which derive their funds from improper or undesirable channels. The regions must incorporate the scale of construction projects from raising of funds into the general scale of their own investments from self-raised funds. In addition, they should collect the construction tax at the above-mentioned tax rates, from the construction projects financed by the raising of funds.

We must enforce the regulation that all self-raised investment funds should be deposited in advance and under a special name in the construction bank, and that only after half a year has passed, and only following approval, can the funds be put to use. We must change the current method of depositing the funds on 30 June and forthwith withdrawing them for use on 1 July. Violations of this regulation shall be punished by confiscation of half of the funds, or even the whole amount of the funds if the gravity of the situation warrants. The confiscated funds shall be delivered to the state.

III. Providing Correct Guidance to Investments by Collectively-Owned Units and Individuals

At present, we are enforcing planned management and control over the fixed asset investments of units under the system of ownership by the whole people and have left out of the plan any control over fixed asset investments by collectives and individuals, allowing them to drift and to take their own course. But following the development of the reform of the economic structure, investments by collectives and individuals have increased rapidly and at present this category of investments has grown to become about one-third of the gross scale of fixed asset investments of the entire economic structure. Failure to provide any control and guidance over such large investments not only may bring about much blind construction and extravagance, but also may aggravate the state of stringency in the supply of construction materials and raw materials, cause a rise in commodity prices, and adversely affect the scheduled completion of the construction projects within the plan of the system of ownership by the whole people.

So as to carry out macro-management and guidance over investments by collectives and individuals, it is necessary to compile a plan of fixed asset investments of the whole society. Also, we should map out the targets for control of the scale of fixed asset investments under the system of collective ownership by provinces, municipalities, and districts and map out the guidance scale of investments in buildings by individuals. Both of the above should be controlled under the plan. At the same time, it is necessary to make full use of economic levers and to strengthen indirect control and guidance.

At present, in investments under the system of ownership by collectives in the cities and the countryside, the scale of investment in township enterprises has developed too rapidly, far exceeding the capacity of the available funds and material resources. In the production of many products, the technological level is low, the materials consumption rate is high, the quality of the products is poor, and the socio-economic effects are below standard. The main reasons for the too-rapid development may be the tax burden being too light and credit and loan control being too lenient. Due to too much of the power to reduce, exempt, assess and examine taxes having been delegated to the lower levels (delegated to counties of the first-grade) and due to many of the comrades lacking a concept or understanding of the statutes on taxation, many of the taxes which should not have been reduced or exempted have been so reduced or exempted. Many localities have failed to enforce the 8-grade excess and cumulative tax rates prescribed by the state (highest tax rate is 55 percent) but collected the taxes according to the 20 percent proportionate rate. While the state originally prescribed that in the event of newly-formed township enterprises meeting with difficulties, they may be exempted from payment of the income tax for a year, many localities have ruled that all new enterprises are exempted from the tax payment for a year. In some cases, enterprises have been exempted from tax payment for 2 to 3 years and in some other cases, enterprises, upon the expiry of the tax-exemption period, have only to change their names to continue to enjoy anew the tax-exemption privileges. Also, under the present new conditions, the existing ruling exempting products whose production and marketing directly serve agriculture from payment of the products tax and the value-increment tax is not rational. At the same time, the state does not collect from the township enterprises the energy and communications major construction funds (if collected, the annual yield from this source alone can amount to 2 billion yuan). In reality, the income tax paid by the township enterprises to the state is lower not only than that of the state-run enterprises but also than that of collective enterprises in the cities. In 1984, the tax rate actually borne by the township enterprises was 12.3 percent whereas in the cities the collective enterprises under the second light industry system paid a tax burden of 30 percent. Calculated on the basis of each 100 yuan of product value, the whole tax burden paid to the state was found to be: state-run enterprises, 16.73 yuan; city and countryside collectively-owned enterprises, 9.65 yuan; and township enterprises, only 4.06 yuan. On the side of credit and loans, the majority of the township enterprises are repaying their technological loans from the profits before payment of the income tax. In some localities they have gone so far as to repay even their capital construction loans from the before-tax profits. This not only has reduced the state's revenue from the income tax but also has served as a major cause for loss of control over the loans to township enterprises. For the purposes of facilitating the stable and healthy development of the township enterprises, we should suitably retract the delegation of the power to exempt or reduce payment of taxes and also abolish the ruling of reducing or exempting new township enterprises from tax payments, replacing it with the requirement that they should pay taxes according to law from the date of their enteringinto production or starting business. In the case of certain impoverished localities and enterprises really in difficulties, they should individually apply to the relevant authorities for tax reduction or exemption and can only do so upon approval. Township enterprises must abide by the tax laws and pay the income tax according to the 8-grade excess and cumulative tax rates; those failing to do so should be subjected to fines by the tax organs. Likewise, we should revise the ruling that products which directly serve agriculture both in production and marketing can all enjoy the privileges of reduction or exemption from payment of the products tax and value-increment tax. The revision should aim at making differential treatment for individual cases. Building up township enterprises should primarily depend on self-owned funds and the banks should keep loans strictly under control. They should reject granting any loans to projects which do not conform with the macroeconomic requirements or which turn out poor economic effects, or whose self-owned funds are not up to the stipulated ratio. On the other hand, they should be more lenient in loan granting, and give the necessary support, to projects related to mining, construction materials, communications, processing of agricultural and sideline products, and coordination of urban industries. Township enterprises should carry out the state's unified regulations, repay loans from after-tax profit retentions and refrain from repaying loans from before-tax profits.

Investments by individuals. Due to the existing state of stringency in the money market, we believe that we should not grant any loans for fixed asset investment by individuals.

Be it a construction project by the whole people, or a collective, or an individual, we should levy the land tax on it so as to practice economy in land use and at the same time to increase major construction funds of the state as well as to control the scale of the fixed asset investments of whole society.

IV. Full Employment of Legal Measures to Ensure the Economic Measures and the Necessary Administrative Measures to Earnestly Bring Their Role into Full Play

In order to control the scale of investments, it is necessary to earnestly strengthen the legal system. Currently, the first problem that must be solved is the non-adherence to legal codes. We should study the formulation of an "investment law." This law should clearly prescribe that the responsible persons or persons in charge of relevant organs should be dealt with according to law for the following offenses: making investments which, without the approval of the State Council, exceed the scale of investments prescribed for self-raised funds or prescribed for bank loans; investments in which the local governments compel the banks to grant extra budget loans or in which the banks themselves grant extra-budget loans; handling investments in projects at random and without approval and investments in which the approving bodies have failed to perform their duties strictly, thereby causing serious losses; investments in which the parties concerned refused to deposit the funds into the construction bank or refused to pay the construction tax, and so on.

BEIJING ENTERPRISES IMPORT MORE TECHNOLOGY

OW170144 Beijing XINHUA in English 0036 GMT 17 May 86

[Text] Beijing, May 17 (XINHUA)--Beijing Enterprises are becoming convinced that importing technology is the quickest way to head for the world market.

According to the Beijing Economic Committee, 500 enterprises, about one eighth of the total, have signed nearly 1,200 technology-import contracts, worth U.S. $1.15 billion, for the food, textile, electronics, machinery, construction materials, medicine, chemical and metallurgical industries.

"The open policy allows us to have a look at our counterparts abroad and find out where we lag behind," said Qi Xianliang, director of the Beijing glass laboratory instrument plant, which started to seek technology from abroad comparatively early. "Only then did we know how foolish we were to be satisfied with our leading position within China."

The plant signed a 10-year contract worth U.S. $700,000 with a Japanese enterprise in 1977. "Our profit and output value have doubled in the past 6 years, and our senior technicians have been trained," he said. And its contacts have been expanded to America, France, Federal Germany, Britain and Belgium.

Before the open policy was adopted in 1979, the equipment of most enterprises had been domestically made in the 1950's, some were even products of the 1930's. Industry managers were ignorant about the outside world.

Things are changing now. Many enterprises have sent staff members abroad to inspect foreign enterprises and study, and at the same time, foreign experts have been invited to China.

Sun Weizhi, director of the Beijing Aluminum Materials Plant, was sceptical about a deal to import a production line from Japan in 1982. But as soon as the production line went into operation, he realized that importing technology is the most efficient and economical way to catch up with the developed countries. He admitted that it would have taken 10 years for his plant to develop a similar production line.

However, "spending hard currency is not the ultimate purpose, but taking a place in the international market," Sun said.

The competition is fierce as more and more enterprises have fixed their eyes on exports, which have increased in recent years. In 1985 Beijing exported goods worth U.S. $620 million; some 63 percent of this was represented by manufacturers, as against 50.8 percent in 1978.

INDUSTRY OFFICIAL DISCUSSES STEPS TO HELP FREE MARKETS

HK270444 Beijing CHINA DAILY in English 27 May 86 p 1

[By staff reporter Guo Zhongshi]

[Text] Free markets all over the country continued to show skyrocketing growth in size and sales in the first 3 months of this year, creating challenging new tasks for the State Administration of Industry and Commerce.

An official of the administration told CHINA DAILY that it nonetheless is determined to help them continue to grow.

Free market sales in the first quarter were 48 per cent greater than in the same period last year. The growth rate that year had been the highest since the founding of the People's Republic.

Last year, total sales in free markets topped 63.2 billion yuan (about $20 billion), a 38.38 per cent rise over 1984.

China has more than 61,000 free markets. They provide a large portion of food in urban and rural areas, said Gong Xiaolan, deputy director of the policy research department of the administration.

In many places, sales of non-staple food in free markets exceed that of state-owned retail stores, Gong said. In Hebei Province, free markets now sell 81 per cent of mutton, 57 per cent of beef, 68 per cent of eggs and 66 per cent of vegetables.

Gong, who is also a member of the council of the Consumer's Association of China, said, "Free market trading has become an important channel of commodity distribution."

He said the thriving market has brought growth in other forms of private industrial and commercial enterprises.

"Transportation, construction and information companies are developing fast in particular," he said.

By the end of last year, the number of registered private enterprises reached 11.71 million, 25.9 per cent more than in 1984. They employed 17.66 million people in cities and townships, a 35.5 per cent increase over 1984, Gong said.

Their business turnover totalled more than 75 billion yuan (about $25 billion), a 63.1 per cent increase.

He said that his administration had been acting like an agent for private businesses with its responsibilities ranging from physical protection to family planning.

Despite some opposition to free markets and private enterprises on the ground that they look bad, make noise, slow traffic and cause sanitation problems, the administration is determined to help free markets and private businesses, he said.

"We will pick the right place for free markets, supply private businessmen with raw materials, protect them from bad treatment and urge them to keep their places clean, but we will never do anything to stop their operation," he said.

"In order to get support for private businesses from the whole society, we must strengthen controls over them and do our best to reduce such problems as speculation, smuggling, cheating and other illegal activities [words indistinct].

NUMBER OF MEDIUM, SMALL CITIES GROWS RAPIDLY

OW260922 Beijing XINHUA in English 0729 GMT 26 May 86

[Text] Beijing, May 26 (XINHUA)--China now has more than 200 small- and medium-sized cities each with a population of less than half a million, a Chinese official said at an international seminar here today.

According to statistics, the number of cities in China grew from 69 in 1949 to 300 in 1984, and annual output value of city industrial production has now accounted for at least 86 percent of the national total.

Wu Peilun, who is in charge of the reform experiment department of the state commission for restructuring the economic system, gave a general account of China's urban development to the participants attending the seminar on development experience in developing countries in the ESCAP (The United Nations Economic and Social Commission for Asia and the Pacific) region.

From the very first day the government of the People's Republic took over the cities, he said, it has emphasized the development of economy and other undertakings. In urban development, he noted, China has followed the principle of "controlling the size of big cities, appropriate development of medium-sized cities and vigorously developing small cities and towns," which helped to bring about prosperity and vigor of the small and medium-sized cities.

A striking feature of the emergence of these small and medium-sized cities is that they involved much less investment, Wu said. Taking Changzhou in Jiangsu Province for example, he continued, state appropriations to this city in the past three decades were less than one billion yuan, but the income handed over to the state by the city in the same period was as much as 7.87 billion yuan.

"High economic performance is the basic character of these cities," he stated.

At present, Wu said, small- and medium-sized cities in China are entering a period of rapid development, since the growth of commodity economy in the countryside is providing a much larger market and raw material base for industries in these cities, and the current urban economic reform has expanded the decision-making power of the cities and enterprises, thus imbuing vitality into city development.

In addition, more and more such cities have opened themselves to the outside world and are striving for modernization through importing foreign technology and speeding up construction of their infrastructure.

EXPANSION PLANNED FOR ECONOMIC INFORMATION NETWORK

HK280440 Beijing CHINA DAILY in English 28 May 86 p 1

[By staff reporter Guo Liyu]

[Text] Zhengzhou--China's economic information network is set to further expand and become more systematic in the near future, according to a report delivered to a national conference here yesterday.

Feng Jixin, director of the National Economic Information Network Council, said that although less than 2 years old, the network was proving vital to the country's economic development.

Before its inception, Feng said, "There were very few organizations devoted to information gathering, analysis and dissemination."

Feng said that during the past 2 years, the network had achieved its goal of serving the country's modernization programme by making scientific use of information resources. It has also widened its contacts with inland areas and regions. The network has grown from covering 50 cities in July, 1984 to its present 203 members in various areas, cities and departments.

Most of the network's local members have taken responsibility for providing local decision-makers with accurate, timely information and statistical material. Consultancy was also part of their work scope, Feng said.

In addition, a national economic information "paper chain" was established last June, with the emergency of seven local papers, including CAPITAL INFORMATION, CENTRAL CHINA INFORMATION HERALD and GUANGDONG-HONG KONG INFORMATION.

The first session of the National Economic Information Network Conference was held in July, 1984, in Harbin. The 5-day Zhengzhou conference has brought 250 participants together.

Seven pioneer cities--Tianjin, Harbin, Wuhan, Chongqing, Hohhot, Dandong and Jilin--were first to realize the urgent need to better use information resources to serve economic growth.

REVIEW OF ANHUI'S DEVELOPING INDUSTRY

Hefei ANHUI RIBAO in Chinese 27 Dec 85 p 1

[Article by Ni Zhimin [0242 1807 2404]: "Sound Reform, Coordinated Development of Production, a Review of the Province's Industry in 1985"]

[Text] Anhui's industry front is steadily and vigorously striding into 1986. In the past year, there has been sound reform work on all fronts of industry, and production has had sustained, steady, and coordinated development. The "such a good situation has not been seen in many years" is not to be considered as excessive.

This year the main feature of Anhui's industrial production has certainly been its rapid rate of increase. The G-V10 surpassed the critical level of 20 billion yuan, totaling 22.2 billion yuan, an increase of 20 percent over last year, which resulted in the emergence of a new situation where "light industry is larger than heavy industry, there being more collectively owned enterprises than state-owned industries, and having more locally run industries than municipal industries." The second feature has been the industrial structure becoming more rational. The proportion of light industry has been steadily climbing and the ratio between light and heavy industry has been further coordinated. The development needs of the raw and semifinished materials industry, the energy resources industry, and the processing industry have basically been met. The third feature has been the marked increase in economic benefits, the increase in profits exceeding the increase in output value with an estimated increase in industrial output value of 15 percent, a profit increase of 22 percent, and a 17-percent increase in profits turned over to the state. Due to improved results from investment there has been a large increase in financial return, breaking through the condition of Anhui's finances being in a state of fluctuation during the last few years. The income for the whole year was over 20 percent more than the previous year, reaching a total of 3 billion yuan.

The successes gained in Anhui's industry development in 1985 were the best in the entire nation during the unfolding of the economic system reform. Following the direction of opening up to the outside and the market mechanism there was a succession of reforms made in the price and wage systems which represented a serious test for Anhui's industrial enterprise beginning in 1985. In order to meet this challenge and to also make achievements in development, the provincial committee, provincial government, and the CPC Central Committee should lead by the policies and principles of the reform of the municipal economic system. These organizations should not miss opportunities to "invigorate large and medium-sized enterprises, expand small enterprises, and energetically develop village and town enterprises" by formulating policies that do these things and to use the increased independence of enterprises as a key to spurring on the entire province to have "a satisfied life." The rapid progress made in Anhui's industrial production during 1985 proves that the reforms carried out in our cities are correct.

In order to stimulate the vitality of this basic economic "cell" in enterprise, Anhui put forward the slogan "grasp reform, increase vitality" early in the year and published articles concerning "relaxation of policies" and "stimulation of industry." Prior to 1985 there were fewer than 100 enterprises using the factory director (manager) responsibility system, but during 1985 it spread throughout the province and now there are 1,640 enterprises utilizing the project director (manager) responsibility system. The 893 state-run enterprises account for more than one-half of all enterprises. The factory director (management) responsibility system has targeted management as its key point. This has allowed the factory director to do a better job of production control and to have more jurisdiction over administrative management, which has effectively spurred on enterprises to change to a new style. On the basis of implementing the factory director responsibility system, Anhui's industrial front has also deeply affected the contract management of enterprises. Successful reform experiences in agriculture were used in planning small accounting units for some large and medium enterprises and in establishing a new internal accounting system for enterprises, thereby more closely integrating the workers responsibilities, rights, and benefits. In enterprises throughout the province there emerged a state of giving consideration to the three benefits of "more income for the state, enterprises retaining more, and more gain for the individual." In the process of carrying out the contract responsibility system the responsible departments aimed at the fear of difficulty some enterprises have. They issued the "Notice Concerning Overall Management of Contracts and Improvement of the Internal Economic Responsibility System of Enterprises," this strengthened and developed the contract management and internal economic responsibility system of enterprise. At the present time, 60 percent of enterprises in Anhui have implemented various forms of the contract management responsibility system. In some small enterprises new forms of collective and individual contracts have also emerged. These various reforms in the internal structure of enterprise have greatly aroused the enthusiasm of the broad numbers of producers and resulted in improved quality.

During the process of stimulating vitality in enterprises, Anhui's responsible departments at all levels continued to carry out reform of equiment, realistically change workstyle, and change from controlling to serving. Provincial departments and bureaus have actively created their own conditions, reorganized companies, and put enterprises under lower administrative levels. Of the 125 enterprises subordinate to 25 provincial departments, 55 were first put under lower administration levels. Simpler administration and relaxed control has increased the conciousness of enterprise producers of socialist commodities.

While reform was being pushed forward, a new condition also emerged in the economic ties between enterprises. This year, Anhui has established economic cooperative relationships with 27 provinces and municipalities, and with more than 80 cities, over 1,500 jointly operated projects have been carried out. Through mutual cooperation they have "used the large to help the small," and "used the strong to help the weak," developed new industries, saved some old enterprises, given impetus to village and town enterprise, and increased Anhui's economic power. With these things alone, the province can increase its output value this year by 200 million yuan.

Ensuring that in enterprise reform there is a relaxation of material production represents another problem to be solved by Anhui's responsible economic departments. During this year, Anhui has further clarified policies on energy construction being centered on local coal mines and power plants. This year the output of local coal mines could reach 5.4 million tons, an increase of 2 million tons over last year. Total electricity generation could exceed 13 billion kWh with an increase in electricity consumption over last year of 1 billion kWh. The development of local energy facilities has relaxed the tense situation of shortages in coal and electricity supply that existed in Anhui. Inflated prices for energy, and for raw and processed material has been a restrictive factor encountered in Anhui's development of industrial enterprise. Faced with this severe problem, related departments in the province have energetically supported technical reform and energy conservation in enterprises. While working under the condition of tight finances, arrangements were made for 684 technical reform projects that needed total funds amounting to 690 million yuan. Through technical reform, Anhui's state of having aging technology in industrial enterprises was changed and their capacity to deal with emergencies was raised, which guaranteed the smooth implementation of internal reform.

In 1985, we led the reform by the "ox's halter" vigorously through the year of the "ox." In the coming year, although there will undoubtedly be many hardships, we can, through a year of reform, have flourishing vitality and increasing vigor. It can be predicted that 1986 will be a year "full of vigor" for Anhui's industrial production.

GUANGDONG'S LIN RUO COMMENTS ON PRODUCTION READJUSTMENT

HK110720 Guangzhou KAIFANG in Chinese No 4, 8 Apr 86 pp 2-4

[Article by JINGJI RIBAO reporter Chen Mao [7115 6290]: "Strive To Do a Good Job in the Great Business of Readjusting the Rural Production Structure--Interview With Guangdong Provincial CPC Committee Secretary Lin Ruo"]

[Text] Some people in rural areas are now keen on talking about "making fortunes by means of running industry and enlivening the economy by developing commerce," but they neglect the point that "there will not be a stable situation if agriculture is not developed." However, provincial party Committee Secretary Lin Ruo has reminded them that agriculture, as the foundation of the national economy, must not be weakened, and efforts for grain production must not be relaxed. Last year, due to the effects of natural disasters, grain output in Guangdong Province fell by a rather big margin. This made some people wonder whether the second reform step and the production structure readjustments in the countryside had gone too far. At this time, Comrade Lin Ruo soberly told them: The rural situation is not merely reflected in grain production, and the situation in grain production in 1 single year cannot represent the general development tendency. When readjusting the rural production structure, as long as we can properly coordinate the development of industry, which will build up fortunes, and the development of agriculture, which is the foundation for a stable economic situation, and properly handle the relationship between grain production and other diversified economic undertakings, we will be able to promote the continuous, steady, and harmonious development of the rural economy. He has repeatedly emphasized this view at rural work conferences and in talks with cadres and ordinary people.

Since last year, Comrade Lin Ruo has made many inspection tours in the mountainous areas in northern and eastern Guangdong and has made rural investigations in western Guangdong and Hainan Island. His purpose is to find the best solution for the readjustment of the rural production structure. Recently, Comrade Lin Ruo discussed this issue at an interview with this reporter.

A convincing fact is: Last year, although Guangdong suffered serious natural disasters, because we persevered in reforms and production structural readjustments, the agricultural output value still increased by 6.8 percent, and the peasants' per capita income reached 495 yuan, or increased by 70 yuan over the previous year.

At the beginning of the interview, Comrade Lin Ruo came straight to the point: Guangdong's grain output decreased by billions of jin last year. Did this show that the situation was not so good? This question concerns how we should correctly assess the results of the rural production structural readjustment. So this question represents a focus of people's attention.

Comrade Lin Ruo recalled Guangdong's experience in readjusting the rural production structure. He said: According to Central Document No 1 in 1985, the main tasks in the second reform step in rural areas are to reform the farm produce purchase system and to readjust the rural production structure. To achieve these purposes, more flexible policies should be taken to decontrol thoroughly agricultural production. The state monopoly purchase system and the quota purchase system for purchasing grain, pigs, and other farm produce have been replaced with a contract purchase system. This measure has shifted agricultural production from a self-supporting economy to a commodity economy, and has thoroughly freed agriculture from the shackles of the old guideline of "taking grain production as the key link." Peasants will be able to have the initiative in arranging their production according to market demands and local conditions under the guidance of state plans. This major breakthrough in rural policies enables Guangdong Province to give full play to its advantages in diversifying agricultural production and developing tropical and subtropical crops. Last year, the whole province reduced the sowing area of paddy rice by more than 5 million mu, and this farmland was used to plant various cash crops. Although grain output decreased, the output of sugarcane, fruit, and fish increased substantially. The production of goods that were in short supply on the markets also increased rapidly. People's needs were better satisfied in many aspects. Because peasants can have the initiative in arranging their production, they can choose the best production structure in light of their local conditions and can bring their local advantages to full play so as to increase both the input and output in agriculture as a whole. In many areas of the province, the proportion of cash crops to grain crops reached 3 to 7. Moreover, the proportion of forestry, animal husbandry, fishery, and sideline production has also increased in agriculture. This development tendency shows that Guangdong's rural production structure has become benign and reasonable and has paved the way for the harmonious development of the rural economy.

Comrade Lin Ruo strongly affirmed: Undoubtedly, following the first reform step of introducing the production contract responsibility system in the countryside, last year's reform of the farm produce purchase system has added new vigor to Guangdong's rural economy. He joyfully told this reporter a convincing fact: Although Guangdong (especially the western part of the province and Hainan Island) suffered serious natural disasters last year, agricultural production still achieved good harvests. The total agricultural output value reached some 17.4 billion yuan, marking an increase of 6.8 percent. All kinds of agricultural products except grain increased by substantial margins. Compared with 1984, sugarcane increased by 28 percent, fruit increased by 53.9 percent, freshwater aquatic products increased by 23.4 percent, and the total income of township enterprises increased by 42.1 percent. With the diversification of agricultural production and the development of secondary and tertiary industries, peasants' per capital income increased to 495 yuan, or 16.5 percent more than the previous year.

Then, Comrade Lin Ruo said with deep feelings: If Guangdong continued the previous practice of concentrating all resources on grain production, the peasants would not have achieved as much income last year as the national conditions were so bad, and there would not be today's prosperous situation in the countryside. Therefore, the central decision on reforming the farm produce purchase system is completely correct. We are full of confidence in the steady development of agricultural production this year.

A useful experience: In the course of readjusting the rural production structure, economic means should be combined with administrative means so as to arouse peasants' enthusiasm for growing grain crops. This does not mean that we will backtrack to the old road of exclusively conducting grain production; instead, this will ensure the steady development of grain production in line with the plans.

When talking with this reporter, Comrade Lin Ruo particularly stressed this viewpoint: Grain is the basis of the foundation for the national economy, and is the primary need in the people's livelihood. Guangdong is a grain-deficient province. Therefore, when readjusting the rural production structure, we must firmly guarantee grain production and make this a long-term strategic principle.

Comrade Lin Ruo clearly realized that after agricultural production was further decontrolled, the production of cash crops would certainly develop substantially because this is an inevitable tendency determined by the regularity of the commodity economy and Guangdong's special geographical conditions. In these circumstances, it is more necessary to pay attention to grain production. On the one hand, as the reforms of the price policies and the price system have just begun, it is not possible to quickly change the state in which planting cash crops can achieve higher income than planting grain crops. This objective factor may stimulate peasants into planting more cash crops and reducing grain production. On the other hand, due to the limited transport capacity, Guangdong Province can only purchase billions of jin of grain from other provinces each year. If grain production continues to decrease, grain supply in the province will become strained, and grain prices will rise. This will affect the people's livelihood and the development of animal husbandry. That is why people say that "one will have no fear if one has sufficient grain reserve." If one runs short of grain, how can one not feel fear?
